I think that most of the material you would like to have in mind when you discuss the Rome Cable Corporation matter with Messrs. Wilson, Davies, and Hickman will have been contained in my letter to Mr. Unverzagt. However, a few other aspects are certainly of importance; and one of them was touched upon in passing in a luncheon conversation I had in Pawtucket, Rhode Island, yesterday. The acquisition by any of the integrated producers of any of the independent wire and cable companies or various combinations of mergers are not nearly as obnoxious to the people who are already active in the wire and cable industry as is the entrance of a newcomer with bright, shiny new equipment. Acquisitions and mergers have the common denominator of not adding to existing capacity in the industry, and everybody in the industry is very conscious of the fact that the entire industry would be much more healthy if each manufacturer were to toss about two-thirds of his equipment into the Atlantic Ocean. Yesterday I had lunch with some of our people and some of the Leviton Manufacturing people including the young Ben Leviton, whom I believe is now Executive Vice-President. Right out of a clear sky Ben asked me if I was aware of the fact that Reynolds Metals was trying to get hold of a wire and cable company. I told him that I had heard the rumor and was not particularly surprised to hear that he had heard it. He then made the statement that he guessed there was no way to keep Reynolds from expanding the way Kaiser did but that it at least would not make the picture any worse from the standpoint of additional fabricating capacity.

Another point that perhaps I should have stressed in my letter to Bill Unverzagt is the fact that in acquiring a company like Rome Cable another important part of the "know-how" is the contact that exists between that com- [fol. 5353] pany and all of its customers. For example, no matter how good we may think our electrical conductor boys are as salesmen, we could not expect them generally speaking to invade fields like magnet wire, building wire, etc. and compete on an even basis with salesmen who have been acquainted with those particular groups for many years; and, of course, as a corollary to this statement, it is self-evident that we would not have enough electrical conductor salesmen to cover all these bases, if we started from scratch, without probably at least doubling their number.

One more good commercial reason for our wanting to acquire Rome is the fact that the Cope Division is a manufacturer of cable racks, and I think it is almost inevitable that a good portion of that business can be swung over to aluminum. I notice that Rome's annual report intimates the same thing. This one factor, of course, would not be anywhere near justification for the acquisition in itself, but it is an additional factor to be considered.

P. T. Coffin.

Re: Rome Cable Corporation

Attached is a schedule showing weight and revenue, by major product, of our sales to Rome Cable Corporation since 1952. You will note the change in pattern of business over this period, from wire and cable to redraw rod and subsequently to almost exclusive sale of pig. I believe this is due to the conversion of their wire-drawing machines and stranders from copper to aluminum, and subsequently the installation of Properzi units, so that they are now completely equipped to fabricate cable from pig.

Since 1955, practically all of these sales have been pig, and we believe it is safe to assume that sales in the future would be confined to pig. Therefore, we have completed the estimated margin on pig sales only for the last three years. The margin shown is based on bone cost excluding G.A. & S.E., and currently averaging a little over 11¢ per pound. Therefore, if sales in future years to Rome Cable should average 4,000,000 pounds annually, the total margin accruing to Alcoa from this source would amount to about $450,000 annually.

Rome Cable currently toll converts all of Alcoa's requirements for Neoprene covered cable and certain odd sizes of Polyethylene covered cable. This is probably a temporary arrangement since we plan to install Neoprene covering facilities sometime in the future. It is significant [fol. 5355] to the present problem to note that, if Alcoa were to acquire Rome Cable's assets, it would not be necessary for Alcoa to make a future capital expenditure for installing Neoprene covering facilities. Conversely, if Rome

Cable's assets were purchased by some other corporation, it might become necessary for us to make the capital expenditure in Neoprene covering facilities at an earlier date than is now contemplated.

Confidential

Memorandum

Re: Rome Cable Corporation

A meeting was held in Mr. Hickman's office at 2:00 P.M. today to discuss the Rome Cable negotiations. I attended this meeting in view of the absence of both you and Norm. Mr. Hickman stated that at the meeting which he and Mr. Davies held with these people, they offered $22,500,000, which would amount to 308,000 shares of Alcoa common stock at current market. This was firmly rejected. Nothing specific was given as to Rome's asking price, although Mr. Hickman gathered they were thinking in terms of three-quarters of a share of Alcoa stock for one Rome share, which would amount to $31,000,000. Mr. Diet apparently is interested only in stock transfer and not in debenture, although the idea of convertible debentures was apparently a new thought to them.

Another meeting in Rome will be held next Tuesday, which will apparently be decisive. In preparation for this meeting, Mr. Hickman requested the calculation of the effect to Alcoa of an offer of $25,000,000 and of $24,000,000. There is apparently some feeling that Rome might be receptive to such an offer. He also requested that we compute the amount which we could afford to offer in terms of debentures, which would leave us in the same net position after taxes as a stock offer of $24,000,000.

[fol. 5358] Matt Stanley will prepare tables showing relative stock values based on past and present market values. A member of the Legal Department will prepare a draft of an agreement of sale. Keith Pouder will prepare tables

showing the economics of a $24,000,000 or $25,000,000 price in terms of stock and debentures.

I am determining the manner in which such a transaction would be shown on our balance sheet, assuming payment in terms of stock at current market value. I will also attempt to develop arguments pointing up the advantages and favorable position to Rome of accepting sale at the proposed prices.

A meeting will be held at 11:00 A.M. Monday in Mr. Hickman's library to present the foregoing data.

T. H. Kerry.

PLAINTIFF'S EXHIBIT 165

October 2, 1957.

Mr. John L. Loeb,
Claridge's Hotel,
London, England.

My dear John:

Our visitors from a certain aluminum company were here yesterday and after several hours of conference they made their offer in common stock only. The offer, in our unanimous judgment, was one that neither or Directors or stockholders would have approved. We, therefore unanimously rejected this offer and expressed our high opinion of their company and our desire to continue cooperation with them in any way possible in the future.

There are certain reasons why they felt the offer as liberal as they can make. Under all circumstances I feel confident you would agree with me. They and we both hope to keep this matter out of the papers and, therefore, are seeking to keep the information contained here in confidence. For your own private information, I am advising their offer was for $24,000,000 of their common stock, which at $75 a share figures out 320,000 shares. These shares pay dividends of $1.20 per annum. I trust that this may be

held in confidence within our group and I sincerely trust you approve of our action.

One of the strong reasons that led us to promptly reject the offer was the dividends that they are paying and the earnings that our company anticipates making so soon as present unsettled price conditions return to something more nearly approaching normal. We figure that with our new equipment and rearrangement in Rome, with very nice earnings coming out of our Cope Division in Collegeville, Pa. and a much improved outlook in California, that our company should hit earnings of $3,000,000 per annum without any difficulty.

I trust that you and Peter are having an interesting, delightful time and trust I will be able to get a glimpse of you sometime late in October.

Very warm regards.

Cordially, ——, ——.

To: Mr. F. L. Magee,
Pittsburgh Office.

I am attaching a memorandum dated October 14 by Mr. Coffin captioned "Acquisition of Insulating and Covering Facilities", as well as considerable covering data. You may not want to wade through all of this but it is interesting that all of the four companies referred to seem to do quite well financially.

There are rumors, unsubstantiated, that Reynolds is shopping around for a company of this type. I believe that we should take some action as promptly as possible,

but at least as far as Phil and I know none of us have personal contacts with any of these firms such as was the case with Rome.

It also seems to me that it would be bad if word circulated that Alcoa was shopping around and I wonder, therefore, if we could not do some shopping through a third party who would not reveal the name of his principal unless and until a real interest was evidenced. I believe there are firms who make a business of doing this kind of work although I do not know who they are. Certainly our financial contacts should have some knowledge as to how this is done or recommendations to make.

I would like to discuss this with you at your convenience.

R. V. Davies.

Re: Rome Cable Corporation

Ross Fraser was visiting his son (perhaps it was a daughter) in Pittsburgh over last weekend and called me on the phone to express to me the same thoughts that he did to you and Lee; namely, that he hoped the breakdown in our negotiations would not result in any change in the hereto-

fore prior good relationships. He said he had talked to you a day or two before on the phone and consequently he wanted to chat with me also.

I told him we were naturally disappointed and found it a little hard to understand why our proposition was not a perfectly good one from their standpoint, considering the basic and intrinsic values incorporated in our system. He replied quite carefully with a measured comment that he and some others did realize the future potentialities of Alcoa and its underlying common stock, but inferred that Mr. Dyett was not sold on the proposition and indicated that he was concerned about the income angle. I pointed out that the convertible proposal took care of this, but he simply reiterated, in more or less veiled terms, that it was the Dyetts who really were the hold-outs. Unfortunately, he gave no indication or suggestion as to re-opening or continuing the negotiations.

Re: Ebasco Services, Inc.

The discouraging angle of your letter of September 23rd points to the strong possibility that we are nearing the end of our rope on the acquisition program. If the Okonite proposition does not work out, it seems to me we are in the position of where we might want to make one more pass at Triangle and possibly the smaller company in Trenton (name slips my mind at the moment), neither of which, as I

understand the situation, has any great promise of success.

Meantime, don't you think that it is highly important that Phil Coffin, along with our Operating and Engineering group, put some real concentrated effort on the development of an alternate program on which we should proceed promptly, if we fail in these instances? I am sure you will agree that no time should be lost getting into our own program, if we fail in the acquisition program.

There is some merit in developing our own program, because even if we have additional negotiations, we will be in a much better position to evaluate whatever offer we might want to make outside, if we have a better understanding as to just what is called for in our own program in the way of facilities, capital expenditures and potential costs. I am, of course, referring to a rounded out program well beyond the neoprene stage, and a program which Mr. Coffin and his associates would recommend to keep us in the No. 1 spot in the aluminum conductor field and, if necessary, a sufficient factor in the copper field to help us maintain the No. 1 position in the aluminum field.

[fol. 5363] I know that we have made the neoprene study, but I am not sure that management has really had a visualization of the whole program ahead of us as our electrical conductor people would visualize. I point out that with this whole picture before us, our offer for a good company might be substantially influenced.

Regardless of the foregoing program, I return to my original point; namely, that the company should really know what we are headed into if we are going on our own and, to my knowledge, this picture has never been developed, as I understand Mr. Coffin's position with regard to our comparatively short range needs to meet the competitive situation.

Re: Ebasco Services, Inc.

Yesterday, upon reading that Kennecott had taken over Okonite, I talked with Phil Coffin. He confirmed my understanding that his next choice to Okonite would be Triangle —his final choice Crescent, and failing in either one of these instances, then we should move as fast as we could under our own steam, as suggested in my letter of October 3rd to Ralph Davies.

I phoned the above information to Mr. Davies, who planned to talk with Mr. I. W. Wilson and if he has no feelings to the contrary, put Ebasco in motion with Triangle as promptly as possible.

Pittsburgh Office.

Re: Preliminary Report Covered & Insulated Wire & Cable

Since our meeting with Mr. H. C. Erskine on November 12, the following progress has been made.

It has been established that Step I, for immediate consideration, should include the following:

Step I—Immediate consideration—

A. Neoprene Line & Auxiliaries—R/A M-2520 Capacity 3,000,000# Al. wt./yr.	$475,000
B. Buncher for Development—Revision to Auth. M-31998 —Additional Funds	1,500
C. Twister and Rewind Line (Guesstimate) Capacity 4,000,000# Al. wt./yr.	110,000*
D. Metal Strip Wrapping Equipment (Guesstimate)	15,000
Total of Estimates	$601,500

* Item A includes sufficient funds for building to include all of Step I.

Should item C be desired before item A, an additional amount estimated at $40,000 would be required to provide suitable building facilities for this equipment. Then item "A" could be reduced by $40,000.

Parts C & D will be included in requests for authorization as soon as engineering and economics are completed. [fol. 5366] As far as the next steps are concerned, they become somewhat intangible and their order cannot be established at this time. However, the following programs should be considered in the final report which should be completed early in January, 1959.

1. Facilities to produce power cable and building wire at Massena.
2. Additional polyethylene and neoprene production facilities for covered conductor at—
   (a) Massena or
   (b) Vancouver or
   (c) Other location
3. Facilities to produce at Massena:
   (a) Armored cables
   (b) Flexible cords and cables
   (c) Radio hook-up wire
   (d) Telephone wires and cables
4. Investigate need for specialized technical personnel.

Re: Covered Conductor—Overall Program

Following are pertinent points developed during my recent Pittsburgh trip:

1. *Neoprene Line*—Joe Healy was working up the profit picture at both a. scheduled prices and b. current depressed prices. Generally speaking, the equipment would decrease our margin loss on neoprene products from $326,000 to $76,000 per year. We have recommended going ahead with project if Alcoa expects to remain in the Covered Conductor Business.

2. *Twister and Rewind Lines*—L. T. Guess has furnished a sales forecast which indicates the need for additional twisting capacity by next fall, or possibly sooner. Additional rewinding capacity would also be required to handle the greater number (same proportion) of expected tank test rejects. Massena was instructed to proceed with necessary R/A for these lines. It should be available for forwarding to Pittsburgh by December 5. Done.

3. *P. T. Coffin's Overall Insulated Conductor Forecast*—Over $500 million per year is present volume of all insulated wire and cable produced domestically, with copper being a 98% factor. Much of this can be replaced economically with aluminum.

The present Kennecot-Kaiser-Okonite-U. S. Rubber combine presents Alcoa with a very formidable opponent. However, fact that Kennecot owns 16% or more of Kaiser should soon have a stabilizing effect on Kaiser's pricing policies.

Insulated Conductor business was historically a profitable one until Kaiser upset the cart. It should return to this attractive profit level soon. Right now we are in an unparrelled price slump.

Mr. Coffin feels that Alcoa must become competitive in

the overall insulated field, including production of copper wires and cables!

[fol. 5368] 4. *P. T. Coffin's Immediate Concerns*—Since we have limited equipment for insulating, we are in a vulnerable spot. Two years ago we lost several good customers due to inability to deliver when required. These customers are still lost to us. Competitors talk Alcoa down as having insufficient facilities to meet demands. We must not let business get away due to lack of facilities. It is very necessary that we meet our delivery schedules, which means that all material scheduled in a month must be shipped out that month, even if we have to make more use of Rome Cable facilities.

Warehouse stocks have been insufficient for recent high level of business with result that business has been lost. Warehouse authorizations to be increased to reflect present and expected future levels. This will be done by Pittsburgh and Massena Planning. Massena should be able to use the forthcoming expected "seasonal lull" to build up the necessary stocks.

5. *Insulated Conductor Survey*—Following Task Force appointed to make survey: Messrs. E. D. Mairs, Chairman, R. W. Knapp, L. T. Guess, J. L. Healy, Ray Andrews, Massena Engineering and T. L. Gilbert.

To make full report in early January on following:

a. Determine product mix and volume to be manufactured.
b. Chronological program for entrance into various insulated categories.
c. Types and amount of equipment required.
d. Location of operations, including survey of existing company buildings.
e. Specialized technical help required.
f. Total investment required and schedule of expenditure.

With this overall picture in mind, my schedule for the time up to about December 12 is:

1. Hold meeting to brief all Massena people concerned on the overall problem. (done)

[fol. 5369] 2. Have Engineering prepare R/A for second

twister and rewind lines. (Expect to have complete by December 5)

3. Push L. T. Guess for triplex forecast so that R/A story can be prepared. (Received November 26)

4. Work up insulated conductor product mix and volume. (Local Purchasing obtaining necessary competitor's price schedule and product data. Should receive today. Also, Guess to furnish me with a special report prepared by Alcoa's electrical consultants in New York.)

5. Preliminary investigations on equipment for power cables and building wire. (Press of above R/A has prevented getting into this.)

6. Join with L. T. Guess in scouting for likely future technical help in the group of insulated conductor people at the annual Wire and Cable Symposium at Asbury Park this week.

7. Tentative trip to Pittsburgh next week to check progress and get needed information.

Although early January Leaves only a short time, it is questionable how accurate a survey will result.

T. L. Gilbert.

Massena Works
Mr. E. D. Mairs
Pittsburgh Office

Re: Interim Report—Covered and Insulated Wire and Cable

Since the preliminary report of November 21, the following progress has been made:

1. R/A submitted for twister and rewind lines @ $135,000.

2. Wire and Cable Symposium in Asbury Park, New Jersey, attended by Messrs. Guess and Gilbert, and acquaintances formed with a number of technical people in

insulated wire and cable field for possible future reference.

3. Discussion held with Monsanto Chemical Company at Springfield, Mass. concerning their recent internal market research report on "The Insulated Wire and Cable Industry". Copy of this report is now in our possession on a loan basis. This report has been of major importance in enabling us to proceed with our own analysis.

4. Tentative sales goals set and tentative order of entry into production of various categories determined. See Table I attached.

5. Dollar volume of sales in two major categories (building wire and power cable) that comprise 1/3 of total has been converted to total conductor covering and insulating tonnages. Analysis of communications wire and cable, which also comprise 1/3 of the total field, awaits the imminent acquisition of necessary price sheets.

6. Pittsburgh Electrical Engineering Department is being solicited to work up the degree of usage of various types of cable construction, along with unit weights of component materials in each type.

7. Need for following types of equipment for both aluminum and copper is forseen:

[fol. 5371] Banbury mixer
Plastic extruders (large and small)
Continuous vulcanizing extruders (small and medium)
Cablers
Bunchers
Rewind and repair lines
Wire serving heads
Taping equipment
Braiding equipment
Twister (small)
Armoring equipment
Wire drawing equipment (intermediate and fine)
Tinning equipment
Electrical test equipment (high and low voltages)
Applicators for asbestos insulation
Molding equipment for flexible cord plugs
Paint

Steps planned for immediate future follow. It is hoped that the final report will be submitted in January, but from

the following listing it will be noted that there is still a major part of the work to be accomplished. Help has been offered and is being used to gain time.

1. Complete tonnage analysis of market. Anaconda Price Books coming—TLG.
1a. Specific items for mfg.
2. Determine cost of necessary equipment types.
3. Establish crew sizes per production unit.
4. Determine amounts of various insulation and covering components required in various cable categories, along with material costs.
5. Assemble complete list of equipment required.
6. Make layout of equipment and determine floor space needed.
[fol. 5372] 7. Plan location of operations and building costs.
8. Estimate technical wire and cable personnel required.
9. Estimate MPC's.
10. Determine profits to be expected, based on current competitive prices.
11. Submit final report.

Re: Insulated Wire & Cable Survey

We in Massena are attempting to arrive at specific wire and cable constructions to be used in figuring type and amounts of equipment necessary and in estimating MFCs. It seems necessary that these types be passed on to you so that the work that Messrs. Gunther and Callahan and you do in determining construction component weights and relative popularity be done using the same bases. If you think that we have chosen some "foul ball" constructions, let me know. Also, if there are some popular items that we have omitted, we can readily add them at this time. The constructions were gleaned from catalogs from G.E., General Cable, and Anaconda.

Attached is a tabulation of the items that we have chosen in the general Power category, which includes Building Wires and Power Cables. Since we already have the necessary equipment for Line Wire and Service Drop Cables, there is no information included on these. The Monsanto classes of Communication and Utilization Wires and Cables are being worked up, and similar data will be sent to you when available. Copper wires and cables only are considered, since aluminum is only a small fraction of these cable types.

[fol. 5375] I expect to bring the results of our work to Pittsburgh for consolidation with your data on January 6.

B. Non-rubber Insulated

1. #2–7 strand TW with 4/64 PVC.
2. Non-Metallic sheathed cable composed of 2–#10 7-strand conductors each with 2/64 PVC insulation and paper tape and 1–#12 solid ground. A filler is run opposite the ground wire, and the composite is jacketed with a saturated and painted double cotton braid.
3. 60°C Fixture wires—#16–26 strand (.010″ individual wires) with 2/64 PVC insulation.
4. 90°C Fixture wires—#16–26 strand (.010″ individual wires) with 2/64 service rigid PVC.

II Power and Control Cables—Rubber and Plastic

A. Control Wires

1. 90°C Switchboard Wire—#12 solid with .020″ PVC insulation plus .020″ asbestos plus .016″ flame resistant cotton braid.
2. #12–7-strand single conductor TW control wire with 3/64 PVC insulation.
3. #12–7 strand multiple conductor (10 conductors per cable) control cable with .020″ PE insulation and .010″ PVC jacketing on individual conduc-

tors, and with glass-reinforced tape and 4/64 PVC jacket on composite cable.

[fol. 5377] 4. #12–19-strand multiple conductor (10 conductors per cable) control cable with 3/64 RH rubber insulation on individual conductors and with cotton tape and 5/64 Neoprene jacket on composite cable.

B. Power Cables

1. #2–7-strand, 600 v. *type RR* with 4/64 rubber insulation and 3/64 Neoprene jacket.
2. #2–7-strand, 600 v. *type RHW* for conduit and and aerial use with 4/64 rubber insulation and 2/64 Neoprene jacket.
3. #2–7-strand, 600 v. type RHW for direct burial (USE) with 4/64 rubber insulation and 3/64 Neoprene jacket.
4. #2–19-strand, *5 KV* for conduit, with 10/64 rubber insulation over a semi-conducting tape and 4/64 Neoprene jacket.
5. #2–19-strand, *5 KV* non-shielded direct burial cable with 10/64 RW rubber insulation over semi-conducting tape and a 3/64 Neoprene jacket.
6. 4/0–19-strand, *5 KV* shielded direct burial cable with a semi-conducting tape, 10/64 rubber insulation, a second semi-conducting tape, a shielding tape, a rubber filled tape, and a 5/64 Neoprene jacket.
7. 4/0–19-strand, *5 KV* cable for either grounded or ungrounded service, with semi-conducting tape, 10/64 PE insulation, second semi-conducting tape and 5/64 PVC jacket.
8. 4/0–19-strand, *7500 volt* cable for grounded neutral service, with semi-conducting tape, 12/64 rubber insulation, shielding tape, rubber filled tape, and 5/64 Neoprene jacket.
9. 4/0–19-strand, *7500 volt* cable for ungrounded neutral service, with semi-conducting tape, 16/64 rubber insulation, shielding tape, rubber filled tape, and 6/64 Neoprene jacket.
10. 4/0–19-strand, *15 KV* cable for grounded neutral service, with semi-conducting tape, 19/64 rubber

insulation, shielding tape, rubber filled tape, and 6/64 Neoprene jacket.

11. 4/0–19-strand, *15 KV* cable for ungrounded neutral service, with semi-conducting tape, 27/64 rubber insulation, shielding tape, rubber filled tape, and 7/64 Neoprene jacket.

[fols. 5378-5379] 12. #3 AWG, 300 v. SE cable with two #3–7-strand phase wires insulated 4/64 type rubber, taped with cellophane, and covered with cotton braid. Two phase wires served with fine wire neutral conductor, covered with moisture sealing tape and glass-cotton heat and moisture resistant braid, then painted.

13. #2 AWG, *300 volt USE* cable with three #2–7-strand phase wires each insulated with 4/64 RHW rubber and taped. Fillers are added and the composite is taped and then jacketed with 7/64 Neoprene.

14. 5 KV Series Lighting—#6 solid with 10/64 PVC insulation.

15. 5 KV Series Lighting—#6 solid with 6/64 PE insulation and 3/64 PVC jacketing.

16. 5 KV Series Lighting—#6 solid with 110 mil. PE insulation.

17. 5 KV Series Lighting—#6 solid with 6/64 Butyl rubber insulation and 3/64 Neoprene jacket.

Pittsburgh Office.

Re: Insulated Wire and Cable Survey

This letter will show progress made thus far on the survey, plus the items we hope to get underway during our next week's visit to Pittsburgh.

A. *Progress So Far*

1. *List of Products to be Manufactured*

Over 60 types have been listed. This information has been forwarded to Pittsburgh personnel for comment and so that relative popularity of each and weights of their components can be worked up.

2. *Types and Costs of Equipment*

These are now firmed up to varying degrees. We expect to get remaining necessary information from suppliers whom Mr. Andrews is arranging to have on hand for discussions.

3. *Direct Materials Needed for Cables*

We have a practically complete list, with purchase prices on most of them.

4. *Machine Production Rates*

Okay on those with which we are familiar. Will get information on others from next week's discussions.

5. *Crew Sizes*

Depends greatly on amount of equipment and layout. To be figured later.

6. *Operational Sequence for Each Cable Type*

Listed except for a few exceptions such as on telephone cables.

7. *Relative Volumes of Main Categories*

Based on NEMA 1955 report, dollar sales volume has been converted to tonnages in five or six main categories of cables.

[fol. 5381] 8. *Old Smelting Building Facility Layout*

A 20 foot-to-the-inch sketch of existing buildings is being drawn up for later layout use.

B. *Work to be Done on Next Week's Visit*

1. Talk to machinery suppliers to get balance of price, speeds, floor area and size ranges needed.
2. Get component weights on typical cables.
3. Convert the relative sales popularity of different cables into tonnages.
4. Get work started on transportation costs to markets.
5. Work with Mr. Healy on MFC development.
6. Develop rough ideas for equipment layout.
7. Determine policy on purchase of equipment for ini-

tial use on copper and later use on aluminum (particularly wire drawing).

8. Pick selling prices from published competitive price schedules for use in determining profit margin.

9. Determine method of merchandising insofar as it might affect discounts.

10. Arrange to get test specifications for such categories as Telephone Cables.

The survey has begun to shape up so that a final report date of late January appears attainable.

T. L. Gilbert.

Re: Insulated Conductors

We need the services of the Commercial Research Department to help us make an overall study in regard to Alcoa's broad participation in the insulated wire and cable field. This study is being made at the request of Mr. Magee. A task force, with Mr. E. D. Mairs as Chairman, is investigating manufacturing facilities, geographic aspects, etc. In order to complete a study of manufacturing facilities, further knowledge of the market is necessary.

This study, giving some general recommendations, must be completed by the end of February. The Commercial Research group can be most helpful in determining:

(1) Market by classifications for building wire, power cables, utilization wire, flexible cords, appliance and fixture wire, and communications, with special reference to size breakdown.

(2) Geographic center of market for insulated conductors.

(3) Areas where penetration of aluminum into this market new held by copper appears most favorable.

(4) Geographic location of plants by competitors.

A simple review of published information should be satisfactory for this study. (The Commercial Research group is more familiar with sources of this information than members of Mr. Mair's task force.) A more detailed study may be required later.

Philip T. Coffin.

[fol. 5383] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 179

The Market for Insulated Copper Conductor

Commercial Research Division

January 17, 1959

T. Allen Johnston.

[fol. 5384] Introduction

This study was made to determine several market aspects of the insulated copper wire and cable market.

Due to a limited amount of time, only published data was examined. Field interviews were conducted with personnel of McGraw-Hill Publishing Co. and the Bureau of the Census, Department of Commerce. No information that could be considered of definite value to this study was obtained from these field interviews.

Data to be obtained were as follows:

1. Market by conductor type and size;
2. Market center for insulated conductors;
3. Conductor types and sizes offering best opportunities for aluminum;
4. Location of competitors' plants.

This report covers only the data obtained by the Commercial Research Division in the limited time available.

[fol. 5385] Market by Conductor Type and Size

The only published data on conductor types was found in the 1954 Census of Manufactures, and page 36B-11 of the Electrical Appliances and Lamps; Insulated Wire and Cable, and Engine Electrical Equipment Bulletin is shown in Exhibit I.

Total sales (manufacturer's selling price) in 1954 were $1,135 million dollars. The largest single conductor group was communications wire and cable with a dollar value of $248 million or almost 25% of total dollar sales.

Exhibit I shows total sales of both insulated wire and cable manufacturers who represent about 30% of the total and the wire drawers who produce the balance of 70 per cent. If a company buys pig, ingot, wire bar, or redraw rod and draws its wire to final size before covering, it is classified by Census as Wire Drawing rather than insulated cable manufacturing. Only those companies purchasing wire drawn to size and then covering are classified as Insulated Wire and Cable manufacturers.

Tonnage of copper consumed for insulated wire and cable by both the Wire Drawing and Insulated Wire and Cable industries in 1954 is estimated to be one billion pounds.

Tonnage of metals consumed by individual wire and cable types shown in Exhibit I is not available as Census did not collect such tonnage data and it will not collect such

3499[illegible]	Appliance wire and cord and flexible cord sets, not specified by kind	2,[illegible]	[illegible]

See footnotes at end of table.

E. N. WAGNER
CLERK U. S. DIV. CT.

[fol. 5387] tonnage data in the 1958 Census of Manufactures now underway.

There is no published data available on covered conductor sales or production by size.

Market Centers for Insulated Conductors

Based on Alcoa's 1957 shipments of covered aluminum conductors the market center was located at Elsberry, Missouri.

Using 1954 Census of Manufactures data of consumption by manufacturing establishments, the center for insulated copper was Central Illinois. Due to Census restrictions on disclosure of data, this center is less exact than that for Alcoa shipments but it is of interest to note the relative proximity of these centers.

No utility consumption of insulated copper wire is included in the Census of Manufactures, and a reasonable assumption would be that the insulated copper market center be slightly to the east of the above center.

Insulated Conductor Types Offering Best Potentials for Conversion to Aluminum

Conductor types offering the best potentials for aluminum are those where the metal cost is the greatest proportion of total conductor cost.

Fine sizes of aluminum wire will be less advantageous than equivalent conductor sizes of copper wire. This will probably eliminate branch circuit wire at the present alu- [fol. 5388] minum-copper price relationship.

The conductor types offering the best potentials initially are:

Power & Feeder Cable #8 and larger
Aircraft Cable
Aerial Cable
Welding Cable

Other conductor types and sizes may well have merit as aluminum conductors, but a detailed study would be necessary.

Location of Insulated Copper Conductor Plants

Exhibit II and accompanying tables show the location of the ten leading manufacturers of insulated copper conductors. The ten leading competitors were obtained from a market research report of Monsanto Chemical Co.

Okonite Co. is shown as a separate company and not combined with Kennecott which previous to the Okonite acquisition was not in the first ten insulated copper conductor manufacturers.

Alcoa

First in Aluminum
Aluminum Company of America

1501 Alcoa Bldg., Pittsburgh 19, Pa.

News Release

For Further Information: Gordon C. Meek, ATlantic 1-4545, Ext. 465

For Immediate Release, Thursday, Jan. 22, 1959

Pittsburgh, Pa., Jan. 22, 1959—Rome Cable Corporation and Aluminum Company of America today announced plans to affiliate.

Frank L. Magee, president of Alcoa, and A. D. Ross Fraser, president of Rome Cable, announced that agreement has been reached on a plan by which Alcoa will acquire all the properties of Rome Cable for 355,226 shares of Alcoa common stock. This will permit distribution to Rome shareholders of three shares of Alcoa common stock on each five shares of Rome common stock. The agreement is contingent upon approval of Rome shareholders, who will meet on March 25. If approved, it will take effect immediately.

Alcoa and Rome plan to combine their electrical conductor, conduit, and accessory activities in a new company to be called Rome Cable Company. The present members of Rome's management will continue in their present capacities in the newly formed company. Mr. H. T. Dyett will retire, as chairman of the board of Rome Cable, when and if the agreement is consummated, rather than at the annual meeting in June, as previously planned; but he will continue to serve on the board of directors of the new company. Alcoa plans to continue the fundamental policies established by the Rome management, and no major changes in personnel or operating procedures are anticipated.

[fol. 5396] Rome Cable Corporation shares currently are listed on the New York Stock Exchange. The company has

approximately 2,500 shareholders. Rome Cable's net sales for the year ending March 31, 1958, amounted to $40,615,000. Annual sales have averaged $47-million over the past five years. The company has approximately 1,500 employees. It operates manufacturing plants at Rome, N. Y.; Torrance, Calif.; and Collegeville, Pa., as well as sales offices in principal cities of the United States.

Rome is best known for its broad line of quality insulated wire and cable products—chiefly made of copper—and for its steel conduit and other wiring systems. Its products are sold to electric utilities, electrical manufacturers, other wire fabricators, industrial users, wholesalers, mines and oil companies. A number of specialty products are made for the military services, especially for use in the missile program.

Rome Cable was founded 23 years ago and has grown rapidly during that time. It is well known in the electrical industry for the emphasis it has placed on research and development activities. During 1958, the company opened a new research center at Rome, N. Y., in order to stimulate further progress in the development of new products and new and improved manufacturing processes and practices. Nearly 40 per cent of the company's sales during the year ending March 31, 1958, came from items that Rome did not manufacture prior to 1950.

[fol. 5397] For more than 60 years, Alcoa has pioneered in the development of aluminum as an electrical conductor. It produces aluminum wire and cable, bus conductors, conductor accessories, conduit, and windings of aluminum sheet and foil for electric transformers and condensers. One of the company's research laboratories is devoted exclusively to the development of new products and processes for the electrical conductor industry.

"Our proposed affiliation with Alcoa," Mr. Fraser said, "is very much in the best interest of Rome's employees, shareowners, and customers. It will make possible more complete service to customers by taking advantage of the combined production and marketing of Alcoa's line of aluminum conductor products, as well as bare and insulated wire and cable products produced by Rome. The coordinated research and development activities of Rome and

Alcoa will provide improved services to the electrical industry."

"The plan that will be submitted to Rome's shareholders," Mr. Magee said, "will make possible greatly improved service to the rapidly growing electrical industry. For many years Alcoa has specialized in the production and sale of bare aluminum conductors, with emphasis on the popular aluminum cable steel reinforced (A.C.S.R.) for electric transmission and distribution lines. More recently, Alcoa has been offering a limited line of insulated aluminum conductors. Rome Cable's complete facilities for the production and sale of many types of insulated wire and cable, as well as bare copper conductors, will fully complement Alcoa's facilities and enable the new organization to meet the increasingly complex requirements of the electrical industry."

News Release

For Release at 7:30 P.M., EDST, Monday, June 15, 1959,
Or Anytime Thereafter

Rome, N.Y., June 15, 1959—The new combination of Rome Cable Corporation and Aluminum Company of America has greatly enhanced opportunities for both concerns to share in the growth of the rapidly expanding U.S. electrical industry.

This bright outlook for the two companies and their personnel was foreseen tonight by Alcoa President Frank L. Magee, in response to a welcome extended to Alcoa by the officers and directors of Rome Cable.

Mr. Magee said both firms should realize future benefits from forthcoming joint effort by their respective research

organizations, increased facilities for production, and broadened sales and distribution networks.

Coupled with these advantages, said Mr. Magee, will be improved opportunities for market exploitation because the product lines of both Rome and Alcoa will, for the first time, be rounded out to provide a full complement of electrical conductor and accessories in aluminum, copper, and steel.

Mr. Magee spoke at the Rome Country Club before an audience which included officials of Rome Cable and Alcoa, and area civic and business leaders.

[fol. 5399] Alcoa officers who flew to Rome today with Mr. Magee were: I. W. Wilson, company board chairman; M. M. Anderson, Leon E. Hickman, and Lawrence Litchfield, Jr., executive vice presidents; Ralph V. Davies, Harold C. Erskine, and Edward B. Wilber, vice presidents; and Alfred M. Hunt, company secretary and director. The group was accompanied by Philip T. Coffin, Alcoa's manager of electrical industry sales, and John L. Fleming, general manager of public relations.

A tour of Rome Cable's Research Laboratory and a meeting of the concern's board of directors preceded luncheon at the country club with a group of Rome Cable management people. A. D. Ross Fraser, president of the new Alcoa subsidiary, welcomed the visitors.

The Alcoa group devoted the afternoon to a tour of the Rome Cable plant and to a press conference attended by area newspaper, television, and radio station representatives, before returning to the country club for dinner.

Mr. Magee told the gathering that Alcoa regarded Rome Cable's experience, talent, and long demonstrated teamwork as more important that the purchase of the firm's plants and equipment.

"The people of Rome Cable are now Alcoa people," he said, adding that Rome's organization will remain intact and that Rome employees now will share in Alcoa employee benefits and job opportunities throughout the parent organization.

[fol. 5400] Alcoa's president lauded the community regard Rome Cable's people had developed toward their

company and themselves during their long tenure, and termed this another corporate asset which Aloca prized and would seek to preserve and nourish.

To: Mr. J. R. Woods
From: C. J. McMurry
Date: April 2, 1959

Subject: Tennessee Valley Authority, Chattanooga, Tennessee

Dear Jack:

As you will recall, last January we had correspondence about getting on the approved list of TVA for aluminum conductor transmission cable. It was set up that at the first opportunity, probably this fall, they would visit our plant for an inspection.

In view of the fact that we are now a division of Alcoa, it would seem that I should kill this request with TVA on these grounds. Have you any comment otherwise?

CJM:wg

Re: Electrical Conductor Cable and Redraw Rod Prices

In line with our conversation this morning, attached is a table supplementing the information included on the tables prepared last week, of which you have a copy.

Based on current costs, an average price increase of $.015 per aluminum pound is needed on cable in order to return 20% on capital employed. This is notwithstanding that in 1948, cable shipments were returning slightly better that 20% on capital, and price increases since 1948 have apparently been adequate to cover increased costs of metal, steel wire and labor. The reasons for this are as follows:

1. In 1948 we had only one plant—Massena—and the invested capital and overhead expense was accordingly much lower.

2. With only one plant in operation, we were operating at that time at close to 100% of capacity as compared to today's operations of only slightly better than 50%.

3. Our change in basis of allocating G.A. & S.E., effective the first of 1955, results in approximately $.008 per pound increased assessment of G.A. & S.E. against this product.

It seems to me that the significant point in this is that our present need for price increases in cable is occasioned by changes in our own facilities and operating practices. Since our competitors have not necessarily had parallel circumstances, we should be aware of the fact that

[fol. 5408] any price increase at this time, although needed by Alcoa, may increase the margin available to a competitor to a point beyond that which has ever been available to him since 1948.

This, of course, can be eliminated, insofar as non-integrated competitors are concerned, by making a corresponding price increase in redraw rod. The attached table indicates that a price increase of $.014 would be needed to offset a $.015 price increase in cable. With a price increase of $.014, redraw rod would return 40% on capital employed. Prior to 1954, redraw rod has always returned a margin equivalent to 30% return or better. A possible pattern of price increases which would return approximately what is needed, without unduly opening the spread between redraw rod and cable, might be as follows:

	Total Price Increase	Increased Net Margin	% Return on Capital (Allowing for 10% Labor Increase)
E. C. Pig	$.005	$.005	....
Redraw Rod	.014	.009	30%
Cable	.018	.013	18%

The above pattern would obtain approximately the price increase needed to recover a 10% labor increase and obtain 20% return on capital for cable, although a small portion of the increased margin would be reflected in pig margins. The increase in spread to a competitor using redraw rod would be only $.002 per pound after consideration of his scrap loss factor.

T. H. Kerry.

Received May 1, 1959. Genl. Files.

Re: Central Cable Company

In accordance with your request we have prepared the following chart and tabulations covering shipments to the captioned company, and comparisons between the prices of aluminum pig, re-draw rod and aluminum conductors:

I. Shipments for 1951-57 (January-June).
II. Estimated Spread Between E.C. Grade Re-Draw Rod, ACSR Scheduled and Competitive Prices (Composite Conductor).
III. Estimated Spread Between E.C. Grade Re-Draw Rod, ACSR Scheduled and Competitive Prices (Aluminum Content Only).
IV. Comparative Prices Aluminum Pig, E.C. Grade Re-Draw Rod, and ACSR 1948-1957.

In discussing the problem with Mr. Coffin, he suggested that the average price of #4, #1/0, #4/0 and 397,500 C.M. sizes of conductors be used for the basis of comparison. He also kindly estimated, from our own revenue figures, competitive prices which have been in effect to a greater or lesser degree since 1952. In view of the fact that Alcoa has neither control of steel core wire prices nor our competitors stranding costs, it was decided to consider the aluminum content of ACSR separately from the complete composite conductor. The tabulation and the chart, therefore, include aluminum content as well as ACSR figures.

Conclusion: Table III indicates that the aluminum content of ACSR in 1948 was approximately 33½¢ per pound. The spread between it and re-draw at that time was 11½¢. By and large, the same ratio of spread has existed since [fol. 5413] that time and today with the aluminum content in the scheduled price of ACSR at 54½¢ per pound, the spread has increased to 20¢. This comparison clearly indicates that the conductor scheduled prices have been increased properly with the price of re-draw rod.

In considering the competitive situation, it is apparent that the worst price cutting occurred in 1955 and the current year. Certainly Alcoa was not the instigator and our own margin reports indicate that prices at which we were forced to take certain pieces of business were not at all satisfactory.

W. B. Howard.

Ch.	Essex Wire Corp.	1,051	252	*6,000	300	(Alcoa — 5% (Alcan —58% (Kaiser —17% (Reynolds —20%
NY	General Cable	4,792	4,349	7,500	6,000	(Alcoa —80% (Alcan —10% (Kaiser —10%
	Totals	14,060	8,535	45,500	15,400	

* From 1957 Sales Aid.

[fol. 5419] In my letter of September 5, addressed to Mr. R. B. McKee, I listed our shipments of E.C. Redraw Rod to our customers who produce cable. During 1956, the in-

dustry shipped 187,356,000 pounds (net aluminum weight) of ACSR and bare cable. During the same period, Alcoa shipped 55,607,000 pounds leaving a balance of 131,749,000 pounds shipped by competitors. Using this latter figure, the 18,849,000 pounds of E.C. Redraw Rod mentioned in my letter of September 5, as being shipped to this group of competitors, would show that our percentage of E.C. Redraw Rod shipped to customers amounted to 14.35%. On the same basis, we would estimate that Kaiser shipped about 7% or 9,000,000 pounds and Reynolds about 2½% or 2,600,000 pounds. This, of course, is not the true picture as to how much metal Alcoa furnished to the industry, because we should add the amount of E.C. Pig that was shipped to customers who make cable. During 1956, the total amount of E.C. Pig and E.C. Redraw Rod shipped to these customers totaled 32,909,000 pounds. So on this basis, and using the figure 131,749,000 pounds as the total tonnage of cable shipped by this group of customers, we supplied 25%.

Considering the fact that we shipped 55,607,000 pounds of cable which added to the E.C. Rod and E.C. Pig would total 88,516,000 pounds and considering the fact that a total of 187,356,000 pounds was shipped by the entire industry, we then supplied 47% of the total metal. I want to caution you that this is a figure you should not use, because we know that some of the E.C. Redraw Rod and E.C. Pig we ship to customers goes into the manufacture of E.C. Bare and Covered Wire, which is not a part of the cable situation. [fol. 5420] Using the Bureau of Census figures of shipments for 1956, which cover E.C. Wire, Covered Wire and Cable, the industry shipped 250,000,000 pounds. Using the figure of 88,516,000 pounds as the total amount of metal supplied by Alcoa, we then arrive at a total percentage participation of 35%. If we use the Bureau of Census figure of total shipments of 250,000,000 pounds and subtract our shipments of cable 55,607,000 pounds, we arrive at a figure of 194,400,000 pounds of products produced by our competitors using E.C. Pig or Redraw Rod. Using this figure, as compared to the E.C. Pig and E.C. Redraw Rod shipped to this group of customers, we arrive at a participation of only 17%.

There are many ways that these figures can be used to arrive at certain percentages, but I believe that the examples

which I have listed above will serve your purpose. It is rather difficult to arrive at any definite set of figures which can be checked with the Bureau of Census figures published in Washington. These figures include E.C. Wire, Covered Wire and Cable, but I believe that facts, as listed above, are more or less in line with the data that you requested. If I can be of any further assistance, please let me know.

Total Cost Excluding G.A. & S.E.	.364	.365	.361	.377	.436	.422
Competitors Margin Before Allowance for G.A. & S.E.	.0277 (loss)	.0219 (loss)	.0231 (loss)	.0230 (loss)	.0250 (loss)	.0368 (loss)

* Note: Alcoa's plant administrative expense includes substantial expenditures for metallurgical and industrial engineering and other technical services, a relatively small portion of which would be incurred by the non-integrated competitor. Likewise, Alcoa's unabsorbed burden includes certain elements of cost which the non-integrated producer would not incur. We have no way of knowing what a competitor's general administrative and selling expense would be and therefore have not attempted to estimate this item. However, the competitor undoubtedly does not sustain the extensive programs Alcoa does for advertising, research, etc. and therefore his general administrative and selling expenses would reasonably be expected to be much lower than Alcoa's. Considering these factors and after making due allowance for the competitor's general administrative and selling expense (Table I does not include provision for the competitor's G.A. & S.E.) it is quite probable that Alcoa's schedule prices, based on price schedules dated 8-1-57, for E.C. redraw rod and cable permit the non-integrated producer to make a profit.

Re: Central Cable Corporation, Jersey Shore, Pa.

In a telephone conversation with Mr. M. C. Harris, Vice President of the captioned today, he stated that he had reason to believe that large users of redraw rod were getting special prices by placing orders for six months requirements. He feels that since they are a good customer they should also have some consideration. I frankly feel that he is misinformed.

To my knowledge, there is no competitive situation at Central Cable regarding prices. They will not have anything to do with Reynolds' redraw and, at last report, the drawing qualities of Kaiser's rod was inferior to ours. I am sure that if either of these two competitors were offering a cheaper rod they would give him some, if not all, of their business. I thought you might be interested in knowing about this, however, and if you have any comments, I would appreciate receiving them.

Re: Central Cable Corporation, Jersey Shore, Pa.

This supplements my letter to you of January 25th regarding the captioned's request for a lower price on his redraw rod requirements.

Attached hereto you will find a letter received today from the captioned, formally requesting a price on their redraw rod requirements for the first half of 1955. We, of course, will make no reply to this letter, nor discuss the situation with the customer until hearing from you. I assume that this same letter was sent to both Reynolds and Kaiser, but I repeat that the customer claims he prefers our product because he does not have faith in the Reynolds method of fabrication nor does the Kaiser rod draw as readily as ours does.

Re: Central Cable Corporation

With reference to Bob Miller's letter of January 25 and your letter of February 4 to Al Gneiser, Messrs. J. G. Detwiler and M. C. Harris called upon Mr. Coffin Tuesday, February 21, ostensibly to talk about our agency agreement on conductor accessories. The subject of redraw rod was brought up during the conversation and in your absence Mr. Coffin did a masterly job of explaining the Company's views regarding the sale of this product to cable stranders.

Mr. Detwiler was informed quite firmly that our margin on redraw rod is too low to permit consideration of any reduction in selling price. Mr. Detwiler was not happy, as you can imagine. He indicated that his purchase probably will be considerably reduced during the first six months of 1955 due to the fact that his competitors have accepted a great deal of cable business at prices below his permissible selling prices. He reiterated his intention to purchase Alcoa rod, however. This is due to the fact that the utilities express a preference for cable fabricated from Alcoa raw material plus the fact that his own experience with directly cast rod has been unsatisfactory. He purchased 50,000 lbs. of rod from Southwire only to find that its drawing characteristics are poor, apparently caused by inclusions.

[fol. 5427] Mr. Harris and I had a brief conversation earlier regarding rod prices, during which I gave him essentially the same information about our rod prices. He insisted that Central Cable has been offered lower prices by our competitors and demanded to know whether we will meet such prices. He tried to infer that Kaiser was quoting $.01 off our price, but did not say this directly. I told him

that redraw rod is not as profitable as many other products and under present circumstances there appears to be no advantage to reducing prices. I do not believe that Kaiser has offered a lower price but will ask Bob Miller and Al Gneiser to keep in close touch with these people in case such an offer develops, at which time we will discuss the subject further with you.

Central Cable are ordering the stranded items they do not produce from Southwire at present which has eliminated us from a substantial amount of cable business. Southwire apparently is allowing them more discount than our 5%.

At the close of our various conversations Bob Miller and I told Messrs. Harris and Detwiler separately that we are very much interested in their rod business and we will do everything in our power to provide the best possible quality and service. Furthermore, we will get in touch with them immediately if there is any change in redraw rod prices. They were assured that their price will be as low as prices offered to anyone else in their particular line of business. [fol. 5428] Mr. Detwiler certainly will be casting around to find some means of saving money on redraw rod and we will continue to keep in close touch with him so that you can be informed at all times.

Mr. R. Murray Willard
District Sales Manager
Aluminum Company of America
90 State Street
Albany 7, New York

Dear Jess:

In your letter of August 2nd you state that it is necessary to increase the prices on the products which we purchase from you. The advance without protection which you are forced to make is understandable, and we can see the need for the revision as you cannot be expected to absorb the wage increases as well as the greater cost of materials and services. Although we are in complete agreement with your policy in charging us more for our aluminum pig, we cannot understand your pricing policies in regard to cable as stated in your price sheets dated June 27, 1955. The policy to which I refer is as follows:

> "The prices stated herein for materials covered hereby shall be firm for a period of 240 days from date of Alcoa's acknowledgment of order, after which they shall be adjusted to and the materials shall be invoiced at Alcoa's prices in effect at time of shipment except that any increases in prices shall not exceed those stated herein by more than 5% within one year from date of Alcoa's acknowledgment of order or by more than an additional 5% within each succeeding year."

As you know, Alcoa is our only source at present for aluminum pig. Consequently, effective immediately we are forced to pay a higher price for the aluminum we purchase, but at the same time in meeting competition the product we sell has a practical ceiling for 240 days based on price of

aluminum in effect prior to August. This makes us feel a little like Cinderella. Unfortunately we have no Prince Charming. What's the answer?

Although we are most unhappy in this middle position, we should enjoy having you come to Rome for that golf game—provided you will play for pennies rather than the dimes we no longer can afford.

Very truly yours, Rome Cable Corporation, ——, ——, Executive Vice President.

Wire Rod Bar File 1121

Re: Electrical Conductor Cable and Redraw Rod Prices

Please refer to our conversation of this morning regarding the spread between E.C. redraw and cable prices.

On February 28, 1956 the price of E.C. pig was increased $.005 per pound, E.C. redraw rod was increased $.010 per pound and cable was increased $.015 per aluminum pound. As a result of these increases, the spread between E.C. redraw rod and cable was increased $.005 per pound.

On August 10, 1956 cable prices were increased $.006 per aluminum pound over the metal, labor and steel cost increases which occurred at that time. This $.006 per pound was intended to cover increased costs and reduced revenue resulting from an increase of 2½% in distributors discount and the elimination of quantity extras. It appears probable that this amount was considerably more than needed, with the result that the spread between redraw rod and cable may have been widened on August 10th.

The proposed reduction in published cable prices to the 3-29-56 price plus 5% will result in an average decrease of $.004 per aluminum pound. Thus, we can absorb this reduction without decreasing the price of redraw and still have a greater spread between redraw and cable (by $.001 per pound or more) than existed before 2-28-56.

If you would like additional data, please advise.

J. L. Healy.

Re: Central Cable Corporation

Mr. L. E. Hickman has requested that I analyze Mr. R. B. McKee's memorandum of August 29, 1957, and your memorandum of September 5, 1957, regarding the above-captioned subject.

If consideration is given to establishing a commodity price on E. C. redraw rod and establishing firm prices therefor on a basis similar to that currently charged for cable, the effect thereof on the customers for E. C. pig must also be studied. Accordingly, it is requested that you advise me as to the sales of E. C. pig during the same periods, namely, 1956 and the first seven months of 1957, limiting such statistics, if you desire, to the total number of customers and the total amount of pig sold and identifying only the major customers with the respective purchases of each. In addition, if you can advise of the extent to which customers purchase standard pig and perform the

alloying operations themselves, such information will be most helpful in analyzing this problem. Likewise, if you could give me some idea of the percentage of the market held by Alcoa in the sale of E. C. redraw rod and the sale of E. C. pig, and also of the percentages of the market held by each of the other two major producers, such information will be most helpful.

York Office
To: Mr. D. B. Miller
Pittsburgh Office.

Re: Central Cable Corporation Jersey Shore, Penna.

When I was in Pittsburgh I told you and others about Mr. Jack Detwiler's offer to purchase 25,000,000 Lbs. of E.C. Redraw from us over the next five years if we could guarantee today's price of $.287 per pound. In return he promised to write a contract with us in which the amount to be taken out would be absolutely firm. When I indicated that we could not write a long term contract without an escalation clause Mr. Detwiler said he might be interested in a one-year deal at today's price. We believe these offers were also going to be made to other suppliers if such had not already been done.

Central Cable claim they are interested only in 62% conductivity and so would not use Properzi stock. We seem to feel they are now getting some of their requirements from Kaiser and the balance from abroad. The

imported coils are one piece spool wound of about 3,000 Lb. weight and Central Cable like them because they eliminate welding and take up much less warehouse space.

We here would be inclined to gamble a bit to get this outfit back in the fold,—they haven't favored us with any business for almost two years—but if a one year firm contract is not in the cards it is felt that we might be able to interest Central Cable in a five year contract tied to the existing price of E.C. Pig. Mr. Detwiler, in effect, buys [fol. 5433] his copper rod on a somewhat similar basis and could well be inclined to look favorably on a like schedule for aluminum.

The build-up of our price today on this Redraw is as follows:

E.C. Pig	Plus Toll Fab.	= E.C. Redraw Price
$.252	$.035	$.287 per Lb.

Subsequent prices would be made up of the then prevailing Pig price plus toll plus maybe a definite maximum escalation on this fabricating differential not to exceed a certain percentage in any one year.

25,000,000 Lbs. is a lot of aluminum and we would like to book it. Central, of course, want some sort of protection in exchange for a firm commitment in this large amount. It is our hope that the above price formula could be made interesting to you. We would like to approach Mr. Detwiler with a proposition if you will fill in the escalation details.

May we suggest a very thorough investigation of the matter. Perhaps some kind of an overall program might be formulated to permit of writing a mutually agreeable contract with other independent wire fabricators as well as Central Cable.

Alfred R. Gneiser.

Re: Westinghouse Electric Corporation, Buffalo, New York

On January 31 Messrs. Baker, Beggs, and myself met with certain Westinghouse people to discuss further their interest in toll fabricating aluminum magnet wire for Alcoa. Those in attendance from Westinghouse were:

Mr. C. W. Parezo, Director of Purchases
Mr. W. G. Miller, Manager, Wire Department
Mr. W. E. Burden, Non-ferrous Buyer

We briefly reviewed what we had already brought out in previous meetings about the unrealistic pricing of aluminum magnet wire by those in the coated copper end of this business. We further pointed out that we had several large customers who had already come to us and who had shown interest in re-designing their product for aluminum and using several million pounds of aluminum magnet wire annually if a reasonable savings over copper could be shown. Our contention was that actual economies did exist in the use of aluminum over copper and that these should be realistically translated into prices of the aluminum product.

Mr. W. G. Miller reacted quite favorably and in the very short time he had to prepare figures, he conservatively estimated that today they have at least 75,000 lbs. aluminum [fol. 5436] capacity per month available for covering the below sizes:

Quantity	Wire Size Diameter
50,000 lbs.	.28-.045
15,000 lbs.	.010-.0254
10,000 lbs.	.144 and larger

The customer's towers are presently set up to use Bondar which is a Westinghouse coating similar to Formvar. It was pointed out, however, that their towers could be changed over to Formvar, if necessary, with very little capital outlay. Mr. Miller further mentioned that additional tower capacity could be made available using their present equipment. It would also be possible, he felt, to install new towers in order to take care of the business. Mr. Burden's questioning was mostly concerned with what level we would attempt to price aluminum magnet wire and whether it would be related to the copper market. We did everything possible to discourage any such pricing of aluminum on the basis of copper. All of us feel that Westinghouse will give us prices on the above sizes, based on their actual costs and including a profit with no unknown factors.

We asked that Westinghouse give us some toll figures on the basis of Alcoa furnishing them with:

1. Redraw rod.
2. Final size wire, 20-25 gage
3. Intermediate wire size, perhaps .189

With Westinghouse's present, although limited, facilities for drawing aluminum wire we are particularly interested in figures on (2) above. The next move is up to Westinghouse who plan to come through with some pricing information very shortly. Should you wish, we could set up a meeting either in Buffalo or Pittsburgh with certain of their top people to discuss this.

[fol. 5437] In the way of sidelights, their Mr. Miller is extremely interested and is the type of person who will make a program like this work. He is the one who has been wielding the big stick at Lima and the fact that Lima has experienced excess breakage during automatic winding doesn't discourage him in the least.

In the interim, Alcoa will have to be thinking about whether Bondar would be acceptable in lieu of Formvar. Mr. E. W. Beggs plans to get technical information on Bondar and, very shortly, will relay it to you.

Another thing we will have to think about is the type of package Alcoa might like for the finished product, i.e. spools, returnable or nonreturnable, or possibly the pail

pack. Then there is the matter of other insulation such as glass or, perhaps, cotton.

I think we are off to a good start at Westinghouse; certainly they are an extremely cooperative lot. Our contacts there are good and we stand ready to move this along just as fast as we are permitted.

Re: REA Magnet Wire Company

I am not sure that I discussed with you the background of Paragraph 4 of Mr. Davies' letter to Bob Whearley. Only the slightest reference was made to the matter when you and I were in Fort Wayne, but it could be quite important.

If we wish to cover the entire field in magnet wire, as I think we should, it will, of course, be necessary for us to be in a position to furnish material such as previously described in numbered paragraph 4. Rea does not have the equipment to make this, but Rome does; and if during my absence you have occasion to discuss the point, as you probably will, I think you should make it quite clear to Rea Magnet that because of our long standing tie-up with Rome we would probably owe first allegiance to them with respect to these particular types of magnet windings. If Rea's reaction is what I think it will be, they will shrug their shoulders and say that they had no intention of getting

into that field now. If, on the other hand, they take the position that they would like to install the necessary equipment and round out their line, then we will be confronted with making a choice between Rea and Rome; and presumably we would have to fall back on Mr. R. V. Davies for both an opinion and probably help.

PLAINTIFF'S EXHIBIT 221

Internal Correspondence

October 1, 1958.

From: R. R. Cope
Pittsburgh Office
To: District Sales Office Managers

Re: Alcoa Aluminum Magnet Wire

In presentations to the sales offices concerning strip and foil windings, we have indicated that there is a potential market for insulated aluminum magnet wire, particularly in the appliance motor field. We also indicated that magnet wire producers have never established realistic prices so aluminum could be competitive with copper. This was true even when copper was as high as 50 cents a pound.

Alcoa has entered into an agreement with Rea Magnet Wire Company, Inc., Fort Wayne, Indiana, to manufacture aluminum magnet wire as an Alcoa product and to sell it as an agent of Alcoa. Rea is a leading independent producer of magnet wire and has pioneered several innovations which are today commonplace in the magnet wire industry.

Realistic prices have been established by Alcoa for the first time, giving cost savings over copper magnet wire of from 6 to 14 per cent for equivalent conductivity.

The Alcoa product will utilize three different types of insulation for the most part, and be available in either single or heavy coatings. Formvar, Nyform and Isonel

(polyester) are the three types of insulation. Formvar and Nyform are Class A insulations. Isonel (polyester) is a Class B and F insulation, capable of operation at 155°C. (The attached material provides this information in more detail.) The size range will be from 12 through 24 gauge. The attached price sheet will prevail. All the types of insulation are priced the same.

" The product will be available on spools or in pails or drums as shown in the attached price list, and will carry the Alcoa label.

[fol. 5440] This new product will give us an opportunity to recommend either round insulated magnet wire or strip as a means of fabricating a particular electrical device.

We ask that you make a real attempt in your contacts with electrical manufacturers to generate interest in this new product, sending any inquiries to Mr. Joseph C. Coyne, Fort Wayne Sales Office, by *teletype* since Rea tells us that the success of the sale of magnet wire is, to a large degree, dependent upon fast action. Under our agreement with Rea, you may actually accept orders for aluminum magnet wire if circumstances indicate the advisability of such action. Normally we should try to place the business through Rea.

We have a decided jump on our competitors in having a quality product, priced to reflect the actual savings available with aluminum. Timing is important. Please make every effort to contact likely prospects. You may be contacted by some of the Rea sales people on problems such as joining; I am sure you will cooperate with them. Attached also is a list of the Rea sales organization.

Re: Aluminum Magnet Wire

I am decidedly bullish over the future of aluminum magnet wire, particularly in the wire sizes in the general range of No. 10 through No. 30. Beyond No. 30, the tensile

strength of aluminum is such that probably wire drawing and handling difficulties would put too high a price tag on aluminum magnet wire for most ordinary uses. My reasons for the optimistic outlook with respect to alumnium magnet wire are based chiefly on one premise and that is my belief that the relative supply and demand pictures for aluminum and copper are so different. Putting it another way, I think that within the next several years copper will get up on a plateau and stay there whereas aluminum appears to be going along at a very stable price level.

There are literally thousands of everyday uses for copper magnet wire such as bell ringing transformers, solenoids and relays of every description, electric toys, electric appliances, fractional horse power motors for work shops, etc., where aluminum magnet wire could be used in many instances for very slight reductions in prices over present day copper prices and in some cases for a considerable reduction in price, all depending upon whether or not space factor is important or the relative price of the winding constituent is large in the article under consideration.

General Electric Company, for example, in its captive manufacture of aluminum magnet wire has been using the product for some seven or eight years in a number of electrical appliances and in refrigerator motors. So far as we [fol. 5444] know, they have had no trouble. G. E. has also been using aluminum magnet wire more recently in dry type distribution and lighting transformers, and some of us are puzzled why some of the General Electric competitors have not followed suit. We know that Westinghouse, in their Buffalo Works, are on the verge of going into an aluminum magnet wire program, but the price of copper has not quite reached the point of swinging the balance.

Another very large outlet for aluminum magnet wire is in the coils of television sets where space factor, particularly for the saddle coils, is not important. Light weight, on the other hand, and price are very important. Up to a short time ago, we thought that probably automobile horns were another excellent outlet for aluminum magnet wire, but Mr. Cope tells me that it appears more and more that while the future for aluminum is excellent in this direction, it will probably be in the form of strip windings rather than magnet wire. I mention this because I think I told you not long

ago that I thought automobile horns were one of the big outlets.

Rea Magnet Wire is making excellent headway in interesting manufacturers in the use of aluminum magnet wire for electronic applications and for missiles and in aircraft where light weight and operating at high temperatures are important. You are probably aware of the fact that copper, when used at elevated temperatures, oxidizes and flakes off and gives all kinds of trouble. That is one of the reasons that Westinghouse recently gave so much publicity to a process that they had purportedly developed for the coating of aluminum on the outside of copper wire. The applications of aluminum magnet wire in this field are quite diversified, and at the present time, at least, the price of satisfactory wire for these applications is of particular importance.

I think that the exploitation of aluminum magnet wire by Alcoa and others will inevitably spur on some of the other [fol. 5445] captive manufacturers such as Western Electric, for example, to also go to aluminum magnet wire, and probably some residual business would come our way as a result, and almost certainly we could get a good share of the aluminum redraw rod.

Rome Cable Corporation enjoys a nice volume of business in square and rectangular magnet wire but does not go down to the smaller so called round sizes in either copper or aluminum. I think that our pushing the aluminum magnet wire application would be a natural and valuable activity to supplement the Rome activities. Generally speaking, the same trade that the Rome salesmen call on for Rome's present magnet wire products would be the same as that for the finer wire sizes of magnet wire to which I refer.

A final reason for my being optimistic about the future of aluminum magnet wire is again a matter of purely personal judgment. It is my belief that those who get in on the ground floor on the exploitation of aluminum magnet wire will be those who reap the biggest reward, and while I do not picture by any means that aluminum will replace copper even in the majority of magnet wire applications, there will be many situations where package deals involving big and small wire, or both copper and aluminum, can

or will be made to advantage. Mr. Cope has advised me from time to time that he thinks that something like 10% of the copper magnet wire market could well be taken over by aluminum. I don't disagree with Mr. Cope except to the extent that I am somewhat more optimistic. I can foresee the possibility of perhaps invading the copper market to the extent of several times that Mr. Cope thinks. A survey by Commercial Research, as I recall it, indicated current consumption of copper in the magnet wire field approximating 500,000,000 pounds per year. Certainly after applying a 50% factor for aluminum-electrical applications, 25,000,000 pounds a year or better in a highly fabricated [fol. 5446] product such as aluminum magnet wire would appear to be a market well worth a pretty good sized gamble.

Philip T. Coffin.

Re: REA Magnet Wire Company, Inc.

Referring to the attached proposed letter, I wonder if it would not be desirable in expressing our thinking as regards the future operations of Rea, to stress the fact that one of the important advantages of our new relationship is that of fostering leadership in the development and utilization of aluminum magnet wire by virtue of Alcoa's background in aluminum research and development and Rea's background in the magnet wire field.

I ran into Paul Gross of our New York Sales Office the other day and he made the remark that the Rome salesmen

whom he had met are all fine fellows, but in the course of working with them, he has found that they are completely copper-minded, and have little recognition of the fact that we would like to develop the use of aluminum in the electrical conductor field. As a matter of fact, he remarked that the general impression seems to be that we purchased Rome only in order to acquire their copper wire business, whereas we all know that while we want all the copper business we can get, at the same time we are certainly anxious to convert copper wire to aluminum wherever aluminum has a natural advantage. We know that the top people in Rome recognize this situation and it is not at all unexpected to find the rank and file do not yet have a recognition of our aluminum program. Obviously, this is one of the good reasons for coordinating the sales force and par- [fol. 5448] ticularly to have some of our men tied in with the Rome sales activities.

Internal Correspondence

January 18, 1960.

From: Leon E. Hickman
Pittsburgh Office
To: Mr. J. L. Fleming
Pittsburgh Office

Alcoa has this day purchased the assets of Rea Magnet Wire Company, Inc. The Rea Company has plants at Fort Wayne and Lafayette, Indiana. The company specializes in the manufacture of smaller sizes of magnet wire, a product used in coil windings, transformers, motors and other electrical and electronic equiment. It is hoped that Rea, in affiliation with Alcoa, will bring aluminum wire into a number of these markets.

I attach a copy of a statement made to the Rea Company concerning Alcoa's proposed policies in the operation of the company.

Leon E. Hickman

Received January 19 1960. John Fleming

[fol. 5450] Aluminum Company of America

1501 Alcoa Building
Pittsburgh 19, Pa.

January 15, 1960.

Mr. Samuel A. Rea,
Chairman of the Board,
Rea Magnet Wire Company, Inc.,
Fort Wayne, Indiana

Dear Sam:

If the stockholders of Rea Magnet Wire Company, Inc., approve the sale of your company to Alcoa, the most challenging opportunity confronting us both is how to utilize your people to the best advantage. Plants and technology are only significant in the hands of the right people. When we were last together, we spent more time on this subject than any other. We in Alcoa have continued to give it a top priority in our thinking because, above all else, we want to maintain the high esprit de corps of the Rea organization and to open to every man and woman in your company improved opportunities under the new program. You are free to tell your people that our thinking is running along the following lines:

(1) *All manufacturing and selling activities of Rea Magnet Wire Company, Inc., now conducted in Fort Wayne*

and Lafayette, Indiana, will be continued in those locations. We already operate aluminum fabricating plants in Lafayette and Richmond and in July, 1960 will open the finest aluminum smelter in the world at Warrick, Indiana. Our experience in Indiana has been outstanding and, with your plants combined with ours, Indiana becomes a major manufacturing center for Alcoa.

(2) *A new corporation, likewise to be known as Rea Magnet Wire Company, Inc., will be formed to take over the properties of the present Rea Company.* Its Board of Directors will consist of a small number of Rea and Alcoa officers selected with an eye to a functional coordination of activities. You and the other officers of Rea will be expected to manage the new company, as you have the old, with only such changes in titles and functions as you have recommended to us or as time and changing circumstances ultimately indicate to be in our common interest. Likewise, the rest of your organization will be carried over intact into the new company.

[fol. 5451] (3) *Wages and benefits.* We agree with you that you should continue your present policies with respect to salaries and wage rates of hourly employees and that you should continue your existing employee benefit plans, including profit sharing. However, should the new company ever be required to negotiate with a union on such matters, the new company can make no commitment as to the continuation of these benefits under those conditions.

(4) *We expect the new company to assume leadership in the development and utilization of aluminum magnet wire.* While we have no intention of minimizing your operations in copper magnet wire, we do anticipate that your experience in the magnet wire field and our know-how in the properties of aluminum can be combined through aggressive research into leadership in the development and utilization of aluminum magnet wire in those applications where aluminum is equal or superior to copper.

(5) *Research,* Both Rea and Alcoa are research-minded. We expect the new company to continue its research activities, indeed to expand them, but also to make full use of the research staff and facilities of Alcoa by coordinating programs.

(6) *We expect the new company to continue the present*

sales organization and policies of Rea, subject only to such modifications as experience may show to be in the common interest. It is hoped that the Alcoa and Rea selling organizations can support each other and coordinate activities to their mutual benefit.

(7) *Purchasing.* We anticipate that the purchasing activities of the new company, particularly in copper, will be handled through its own organization, but in coordination with Alcoa purchases in the same or related fields.

(8) *The new company will operate functionally as a Division of Alcoa.* It will have full responsibility for the manufacture and sale of the products presently manufactured by the Rea Company and such others as may be appropriate to its activities. As a Division of Alcoa, Rea will [fol. 5452] draw upon Alcoa for such help as Rea may desire and Alcoa may have available, whether it be in the field of research, manufacturing or engineering know-how, selling experience, customer contacts, or staff services of any of the numerous kinds made available in Alcoa. It is our intention to give the new Rea organization autonomy and authority commensurate with its responsibilities and to depend upon the good judgment of the Rea organization to make full use of the strength available through affiliation with Alcoa.

(9) *Modifications in the light of experience.* I am sure you realize that, while we speak in complete candor and good faith, these policies must always be subject to modification or change as experience may dictate. A rigid commitment on any of these points would be no more in your interest than in ours. For example, tax considerations may ultimately make it advisable to liquidate the new company into Alcoa and thereafter operate it simply as one of the Divisions of the parent company. Some of your people are quite likely to find additional opportunities for advancement in the Alcoa organization. No decision can be reached now as to where it would be advisable to manufacture new products or supplement the production of existing items.

There is an element of faith in this, as in all worthwhile matters. If we did not share that faith, we would not have offered your company this affiliation with Alcoa, nor would

your Board have recommended its acceptance to your stockholders. We are counting on your people, strengthened by the support that Alcoa can give them, to develop the magnet wire business of Rea, both in copper and aluminum, well beyond its present potential. We can go far together if we maintain a mutual confidence and a willingness to adapt our program to changing circumstances. Subject only to those inevitable contingencies, this letter expresses our full thinking to date.

And I may say that we welcome you and every man and woman in the Rea organization into the Alcoa family with genuine enthusiasm and a confidence that we shall do well in partnership.

With cordial regards, I am

Sincerely, Leon E. Hickman, Executive Vice President.

[fol. 5453] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 227

General Files

Received February 9, 1960, General Files

Jan. 28, 1960.

Mr. Philip Sporn,
President, American Electric Power Service Corporation
30 Church Street,
New York 8, New York

Dear Phil:

Our interest in the Rome Cable Corporation and now in the Rea Magnet Wire Company was stimulated by our long-time confidence in the future of aluminum in the electrical industry. Thanks to progressive industrialists like you and companies like American Electric Power Service, aluminum continues to make progress in the many fields which involve the use of electric current. In addition, there are, as you

know, many other possibilities for aluminum to be used by the electrical manufacturing and electrical utility industries.

As an old friend of ours, you might be interested to know that these are the first two outside acquisitions ever made by Alcoa. Our decision was made in the belief that we could progress faster by acquiring these two aggressive and highly reputable companies, as well as the fact that we have had friendly relations with these companies for a long time and were attracted by their keen interest in the potentialities of aluminum in their respective fields.

We have been especially attracted by the fine organization which is behind the Rea Magnet Wire Company, from Sam Rea right through to the last workman. We fully intend that they shall continue to operate autonomously, and we have every reason to believe that they can not only expand their operations in the aluminum wire field, but that they will continue to grow in their present field of endeavor.

We in Alcoa always thought it was a pretty sad day when we had to give up any thought of acquiring the Newark, Ohio plant, which is now occupied by one of our good competitors. While the Rea Magnet Wire Company is a comparatively small operation, it is a real pleasure to again [fol. 5454] have one of our operations on the system of A.E.P.

You were most thoughtful to write me such a nice letter about our Rea acquisition. While we will miss you on April 11th, you will have our best wishes for a pleasant trip to Europe and I can assure you we will be more than pleased to get to know Bud Hill and Red Doyle when we have our Fort Wayne-Rea get acquainted day.

With best regards, I am

Sincerely yours, Frank L. Magee, President.

Summary of Findings	1
Recommendations	7
Introduction	9
I. Markets	12
II. Products	31
III. Prices and Price Policies	49
IV. Competition	56
V. Merchandising	59
VI. Distribution	61
VII. Alcoa Production and Technical Facilities	62
VIII. Future Possibilities	63
Appendix	65

[fol. 5457] **Summary of Findings**

1. This report describes and evaluates the market for fine wire ranging in diameter from 0.010" to 0.020" and in a few cases as low as 0.005". The insect screening market was omitted. Applications using or showing a potential for the following metals were considered:

Aluminum
Copper and copper base alloys
Stainless steel

2. The total present market, 1954, was equivalent in volume to 81,087,000 lbs. of aluminum. In actual pounds, it was divided by type of metal as follows:

	Pounds	% of Total Metal Volume
Aluminum	1,147,000	1.4
Copper and copper base	254,466,000	95.1
Stainless steel	8,520,000	3.5
Total	264,133,000	100.0

The same total divided by major type of end use results in the following:

	Pounds	% of Total Metal Volume
Electrical products use	246,101,000	92.8
Non-electrical products use	18,032,000	7.2
Total	264,133,000	100.0

3. Aluminum fine wire used in 1954 represented 1.4% of the total volume. The principal markets are listed below:

	Pounds
Shipboard cable armor	400,000
Aircraft cable	350,000
Automotive air filters	120,000
Industrial wire cloth	102,000
Tea bag staples	100,000
Others	75,000
Total	1,147,000

[fol. 5458] 4. The Alcoa share of the present aluminum market was 39.6% and represented sales of redraw rod and fine wire as follows:

	Pounds
Redraw	242,000
Fine Wire	212,560
Total	454,560

5. Copper and copper base alloy fine wire dominated the 1954 market—95.1% of the metal volume, equivalent to 77,115,000 lbs. of aluminum. The principal copper markets are listed below:

	Pounds
Telephone systems	80,757,000
Flexible cords	45,000,000
Automotive wiring	41,958,000
Magnet wire	24,911,000
Power cable	16,500,000
Paper mill mesh	9,000,000
Others	36,340,000
Total	254,466,000

6. Stainless steel fine wire accounted for 3.5% of the 1954 market by volume, actually 8,520,000 pounds.

7. The total future market by 1960 is estimated to be equivalent in annual volume to 92,310,000 lbs. of aluminum, 13.8% greater than 1954. In actual pounds, it will be divided by type of metal as follows:

	Pounds	% of Total Metal Volume	% Increase Over 1954
Aluminum	20,390,000	22.1	1680.0
Copper and copper base	227,690,000	74.8	−10.5
Stainless steel	8,770,000	3.1	2.9
Total	256,850,000	100.0	

This total, divided by major type of product use, results in the following:

[fol. 5459]

	Pounds	% of Total Metal Volume
Electrical products use	236,890,000	92.0
Non-electrical products use	19,960,000	8.0
Total	256,850,000	100.0

8. Aluminum fine wire should represent 22.1% of the 1960 volume. With the exception of aircraft cable, the principal markets of the future will be new ones as listed below:

	Pounds
Automotive wiring	7,280,000
Flexible cords	6,060,000
Aircraft cable	1,250,000
Paper mill mesh	1,100,000
Power cable	930,000
Others	3,770,000
Total	20,390,000

9. It is significant that over 90.0% of the sales by primary aluminum producers to the 1960 fine wire markets will be in the form of redraw rod and wire. The bulk of the fine wire will be drawn in captive plants for internal consumption.

10. Alcoa's share of the 1960 aluminum fine wire market should be about 60.0%, divided as follows:

Product	Pounds	% Increase Over 1954
Fine Wire	1,243,000	487.0
Redraw	11,085,000	4480.0
Total	12,328,000	

11. The copper and copper base alloy share of the market by metal volume will drop to 74.8% in 1960, equivalent to 69,000,000 lbs. of aluminum. Their principal markets are listed on the following page:

[fol. 5460]

	Pounds
Telephone systems	70,390,000
Flexible cords	38,800,000
Magnet wire	32,500,000
Automotive wiring	30,775,000
Power cable	16,000,000
Paper mill mesh	8,800,000
Others	30,425,000
Total	227,690,000

12. The consumption of stainless steel wire will show little change by 1960, up 2.9% to 8,770,000 pounds.

13. Fine wire buying centers located in the northeastern section of the country purchased about 90.0% of the volume used in 1954. The pattern should be the same in 1960.

14. The degree to which the following product requirements are met will have a direct effect on the future sales of aluminum fine wire:

a. Develop and promote an economical tinning process.
b. Develop economical joining processes.
c. Increase drawing speed.
d. Increase strength-conductivity relationship.
e. Improve fatigue properties.
f. Increase elongation without sacrificing yield strength.
g. Improve consistency of mechanical properties.
h. Provide an oiled wire.
i. Provide facilities for special spooling requirements.

15. The present price of EC grade aluminum fine wire is competitive with copper on a conductivity basis in diameters from 0.010" to 0.020". However, even with the lowest prices developed by Alcoa's Accounting Department based on optimum production, EC is not competitive with copper when other costs of manufacturing insulated wire are considered.

[fol. 5461] 16. The present price of 5056 alloy aluminum fine wire is competitive on a volume basis with the other metals considered in this study.

17. Since World War II, the basic ingot price of aluminum has increased 62.7% while copper soared 258.0% There are no indications that this trend will be reversed during the forecast period. Naturally, any future increase in the spread between basic aluminum and copper prices will improve the chances for the substitution of aluminum.

18. The basic price policies of the fine wire industry are similar; wire is priced by the pound with extras for small quantities. Variations occur in base price quantities; copper has a lower and broader base (200 to 29,999 lbs.) than aluminum (2000 lbs.).

19. Companies drawing fine wire may be classified as follows:

a. Integrated producers; from smelting to fine wire for sale.
b. Independent; purchase redraw from others and produce fine wire for sale.

c. Captive; draw fine wire for internal use, may be either integrated or independent companies.

20. There are only 6 integrated producers of aluminum and copper fine wire but hundreds of independent and captive plants.

21. The fine wire industry has been a follower rather than a promoter. Relatively little money is spent for promotion, advertising or product development.

22. The most effective merchandising method for the sale of aluminum fine wire is direct customer contacts by salesmen and sales development engineers.

23. The normal method of distributing fine wire and redraw rod is by direct mill shipment.

24. Copper producers maintain stocks of wire bars to meet the rapid delivery requirements that prevail in the electrical products market. There is some stocking of fine wire.

[fol. 5462] 25. It may be necessary for Alcoa to increase its stock of EC redraw rod at Massena, but it is not likely that the volume by 1960 will warrant stocking fine wire.

26. Most of Alcoa's fine wire machines are modern. The present idle capacity of 6,000,000 lbs. would be more than necessary to fill the estimated 1960 demand of 1,225,000 pounds.

Key Business Indicators (Table 11)	35

[fol. 5465] Summary of Findings

The period from now to 1975 promises to be a relatively prosperous one, barring the effects of war not assumed in this forecast. Recessions may be more frequent than in the past but they should be minor and of short duration. The Gross National Product should move ahead at an annual rate of at least 3% compounded annually influenced by a strong growth in population and an annual increase in productivity of 2.65 per cent.

Total net shipments of aluminum in the United States amounted to 4.0 billion pounds in 1955. A 43% increase to 5.7 billion pounds by 1960, and a 108% increase (over 1955) to 8.3 billion pounds by 1965 is forecast. Continuation of this growth pattern envisions a 15.0 billion pound market for aluminum in 1975, 3.75 times the current demand. Because of cyclical variations, aluminum shipments in any one year may not be exactly as forecast; they should follow the past ten-year pattern of varying plus or minus 10% from the forecast trend.

Aluminum shipments should increase in five-year periods as follows:

1955–1960	9.0%	compounded	annually
1960–1965	7.75%	"	"
1965–1970	7.0%	"	"
1970–1975	5.75%	"	"

Aluminum's maturity in several markets substantiates a lessening of its growth curve, but the potentialities of aluminum use in many other markets cannot yet be fully estimated.

In the next 10 years, Electrical, Packaging, Building Product and Motor Transportation uses will increase their consumption of aluminum at a faster rate than other industries. Some military and aircraft usage will actually decline. About 70% of the growth by 1965 will be accounted for by 30 major applications, led by these six whose combined increase will account for 40% of the industry's increase:

Doors and Windows
Passenger Cars
Primary Electrical Power Cable
Air Conditioning

Motor Trucks
Highway Freight Trailers

All major aluminum products will grow in volume. Those exceeding the industry growth rate of plus 108% in the next 10 years are:

Welded Tube
Foil
Electrical Wire & Cable
Permanent Mold Castings
Extrusions
Drawn Tube

Sheet and Die Castings should match industry growth.

Alcoa's share of aluminum volume (exclusive of its shipments of finished products such as rivets, nails, closures, etc.) amounted to 1.54 billion pounds in 1955, or 38.5% of the total. As a result of strong competitive pressures, its shipments may not grow as fast as total industry shipments. A decline in Alcoa participation is therefore forecast over the next 20 years. By 1960, its share should amount to 34.3% (1.96 billion pounds); by 1965, 32.1% (2.66 billion pounds). In the second decade, it is forecast Alcoa's participation will not be allowed to slip below 30%, for a 4.5 billion pound shipment in 1975.

[fol. 5466] Introduction

At the request of the Sales Vice Presidents, the Commercial Research Division undertook the task of bringing up to date the so-called "Davies Report" of February 4, 1952. Specifically, the objectives were:

1. To make medium and long-term forecasts of the total U.S. demand for aluminum as determined by an analysis of each market's demand;
2. To determine from forecasts the demand for major aluminum products during the period in question;
3. To estimate Alcoa participation.

The year 1955 was chosen as the base year. The years 1960, 1965 and 1975 were chosen for the five, ten and twenty-year forecast periods.

In order to forecast the future demand for aluminum, it is fundamentally necessary to forecast economic trends, and in turn, the future production and sale of products that will use aluminum. Once the economic climate is established for the future, predictions can be made for automobile production, new housing starts, appliance sales, electric power production, etc. The economic basis for this report is the Commercial Research Division's composite of the soundest opinions, predictions and forecasts made by many economists and business organizations. The key indicators chosen are listed in Table 11 (page 35).

This report is based on the "market build-up" method of forecasting. An economic forecast thus provides a basis for measuring aluminum usage in future years if no wider application of aluminum were made. But an allowance must also be made for aluminum's growth possibilities. A thorough analysis of sales and technological developments in each of some 200 applications provided a good measurement of growing usage and the aluminum products involved.

As one source of information, the Sales Development Division's "Crystal-Gazing" report of late 1956 was used. In it, each section listed many possible applications of aluminum with reasonable "promise" of success and gave a measure of the tonnage that might be developed as "new business" for 1961. All Commercial Research Division market studies to date were reviewed. Out of detailed personal interviews with personnel in these divisions, and with some product managers, came a realistic growth pattern for each of the major applications of aluminum.

A forecast to be of benefit must be constantly reviewed and revised. It is important also that each review or revision be conducted within the same framework. A considerable part of this study's task involved the development of a suitable forecasting method and a procedure for identifying shipments of aluminum products to each of the major end uses.

It is planned to review annually total shipments of aluminum by the industry and by Alcoa. Biannually, a review of this entire report is contemplated.

[fol. 5467] Report Methods

1. "Direct" Participation

A true measure of Alcoa's participation in any market can only be obtained by comparing its "direct" shipments with industry *net* shipments. "Direct" shipments are herein defined as shipments of Alcoa primary products direct to customers who immediately use the product in fabrication or assembly. Excluded are any Alcoa shipments of primary products to customers who first "convert" these products into other primary wrought or cast products before their fabrication or assembly into the end use application. Thus, shipments of Alcoa extrusions to a window manufacturer are counted in "direct" participation; shipments of extrusion billets to a window manufacturer that has a captive press are not counted.

The manner in which industry statistics are gathered does not allow for a direct comparison of Alcoa's *gross* shipments with industry *gross* shipments. Furthermore, shipments of some products for further conversion cannot be market identified.

A clearer understanding of Alcoa's performance in the various markets is obtained if Alcoa is considered to have two major market groups: (1) The End Use Market, and (2) The so-called "Conversion" Market. Its participation in the first can be measured only on a market "direct" participation basis. Its share in the second, and its over-all participation, can only be measured on a product basis.

2. Measurement of Future Alcoa Participation

Alcoa's market participation is based on its share of the use of each aluminum product in each application. Its future participation reflects a growing competitive productive capacity. It appears reasonable to assume that for several major products Alcoa's participation will be severely restrained by the available production capacity and sales efforts of its competitors.

3. Market Classification

Figures in the report are classified by *ten* Major Markets. Some tables are expanded into 40 different categories with-

in those markets. This classification system is essentially the same as adopted by the Aluminum Association and is based on the Bureau of Census' classification of metal consuming industries.

Two Aluminum Association markets have been excluded: the "Conversion" market, for reasons explained in paragraph 1 above, and Distributors and Jobbers, which are not end use markets in themselves. The latter volume was prorated among markets on two bases: (1) obvious end use products, such as irrigation pipe, cable or pigment were placed in their proper markets; (2) all other metal was apportioned among markets according to the pattern of market shipments reported by members to the Aluminum Association, with some minor adjustments.

The volumes shown in each market can be taken to mean "use" or consumption by the market, with the understanding that they are actually "shipments to the user." (Scrap generated in the manufacture of end use products is thus not deducted.)

[fol. 5468] Section I—Total Shipments

Industry Shipments

Complex pressures existed in the last ten years which acted to decrease, as well as increase, the demand for aluminum. Were similar conditions to exist, the strong statistical growth trend should continue well into the future. The Mathematics Service Section of Alcoa's Metallurgical Division analyzed aluminum shipments from the year 1901 and projected the growth curve ten years hence. Its results substantiate this trend of aluminum based on past history.

The "market build-up" method projections are therefore substantiated statistically. As noted on the first graph following, several other independent studies also generally agree with the demand figures shown in this report.

Although a healthy growth is predicted based on past trends, it is also a fact that aluminum's maturity in several markets will act to restrain this trend. At the same time, it is too early to measure the full potentialities of aluminum

use in many other markets. Aluminum shipments should increase in five-year periods as follows:

1955–1960	9.0% compounded annually
1960–1965	7.75% " "
1965–1970	7.0% " "
1970–1975	5.75% " "

Past history indicates that shipments may vary plus or minus 10% from the forecast trend in any one year.

Alcoa Shipments

As previously stated, Alcoa's participation in each market can only be measured by comparing its "direct" shipments with industry *net* shipments. Excluded are any Alcoa shipments of primary mill products to customers who first "convert" these products into other primary products before use.

As shown in Table 2, Alcoa's *total* participation is made up of (1) its shipments "direct" to customers for immediate use in fabricated products and (2) its so-called "conversion" shipments.

Alcoa's total share of aluminum volume (exclusive of its shipments of stockpile pig and finished products, such as rivets, nails, closures, etc.) amounted to 1.54 billion pounds in 1955, or 38.5% of the total. Its "direct" participation amounted to 27.6%. Its share of metal supplied by all other producers and fabricators amounted to 15.0%. By 1960, its total share could decline to 34.3% (1.96 billion pounds); by 1965, 32.1% (2.66 billion pounds)—as a result of strong competitive pressures. By 1975, it is forecast that Alcoa's participation will not be allowed to slip below 30.0%, for a 4.5 billion pound shipment in that year.

Alcoa's total shipments to customers thus will show increases over its 1955 shipments as follows:

Year	Alcoa Increase Over 1955	Industry Increase Over 1955
1960	+ 27%	+ 43%
1965	+ 73%	+108%
1975	+192%	+275%

[fol. 5475] In United States District Court

Plaintiff's Exhibit 232

Insulated Aluminum Power Cables

Aluminum has long been used, and long been completely accepted, as an electrical conductor. All that is needed to verify this is a glance upward at the aluminum transmission lines that criss-cross our skylines. Yet, with all its acceptance and application for overhead conductors and bus, aluminum has not received recognition as a conductor material for insulated power cables except by the aluminum industry itself.

The reasons for this are not hard to find. One of the strongest, however illogical it may be, is resistance to change—in the form of new materials and different procedures—which use of insulated aluminum conductors would present. Equally compelling reasons at one time—and at that time completely logical—were supply and cost: with the exception of brief periods in the late 40's and early 50's, it has only been recently that a sound case could be made for the use of aluminum either on the basis of material availability or installed economy.

Supply

The first chink in the armor of copper's exclusive enjoyment of the insulated cable field came during two brief but severe shortages of copper, immediately following World [fol. 5476] War II and during the Korean War. A considerable amount of insulated aluminum cable was manufactured and installed in 1947, and again in 1952, representing the first real use of aluminum in the field.

Though these were short-range situations, which changed within a few months, they provide a basis of engineering, installation, and operating experience.

Some mistakes were made. One was the use of the same temper of wire—hard-drawn—as is ordinarily used for overhead conductors. This difficulty was overcome by Aluminum Company of America's development of partially annealed tempers, EC-H24 and EC-H26, which have handling characteristics similar to partially annealed copper.

Another difficulty was that fittings which had been found satisfactory for copper were assumed to be equally satisfactory for aluminum. When it was recognized that this was not true, Alcoa opened its laboratories to a number of manufacturers of electrical fittings interested in developing suitable fittings for aluminum. This was accomplished in a relatively short time.

Because of the knowledge gained and the problems solved in these early installations, insulated aluminum has now become the standard for all Alcoa plants. Many of these plants have continuous operations that cannot tolerate shutdown.

[fol. 5477] Of great future significance in looking at long-range availability is the practical fact that the world's supply of aluminum is vastly greater than that of copper. As use of all metals increases, copper will be more and more exclusively confined to the many uses for which it is uniquely suited. Already proven is aluminum's capability to do the job as a power cable. Simply on the basis of future material supply alone, therefore, universal application of the aluminum power cable seems inevitable.

Cost

Insulated aluminum cables are here to stay because present economics and projections of future cost relationships of aluminum and copper favor aluminum. The amount of savings from use of aluminum usually depend upon whether conductor selection is determined by equal resistance or equal temperature rise.

When equal resistance is the factor, an aluminum conductor* must be 1.59 times the cross-sectional area of a given copper conductor, to have the same d.c. resistance. For A.W.G. sizes this means that a No. 6 aluminum wire has the same d.c. resistance as a No. 8 copper wire. How- [fol. 5478] ever, even with this increase in cross-section, use of aluminum results in the conductor having less than half the weight of a comparable copper conductor. This is illustrated by saying that one pound of copper will produce a No. 8 wire twenty feet long, and one pound of aluminum will produce a No. 6 wire 41 feet long, while both will have the same d.c. resistance per foot.

If conductor selection is based upon allowable temperature rise, (current carrying capacity tables), an aluminum conductor need have only about 36 per cent more cross-sectional area than a comparable copper conductor. The weight of aluminum in this circumstance is only 41 per cent the weight of the copper conductor to do the same job. Tests show that, depending upon size, aluminum conductors have 78 to 84 per cent the capacity of the same size copper conductor having the same insulation. The following is a tabulation from the AIEE publication, Electric Power Distribution for Industrial Plants, October, 1956:

Aluminum Current-Carrying Capacities—60 Cycles

Conversion factors for determining current ratings of aluminum conductors from values given for same size copper in IPCEA current-carrying capacity tables.

---

* "Conductor" as used in this article refers to the metal wire portion of the cable.

[fol. 5479] Standard Concentric Stranding

For Cables in Air, or in Non-Metallic Conduit		For Cables with Metallic Seath or in Metallic Conduit	
(1) Size	(2) Factor	(3) Size	(4) Factor
....	....	Up to No. 1	0.78
....	....	1/0–4/0	0.79
Up to 500	0.78	250–400	0.80
600	0.79		
700–900	0.79	500–800	0.81
1000	0.80	900–1000	0.82
1250	0.80	1250	0.82
1500	0.81	1500	0.83
1750	0.82	1750	0.84
2000	0.83	2000	0.84

From a practical point of view, current-carrying capacities can be obtained from Tables 1a and 2a, National Electric Code, 1956 Edition. Comparative tests have shown that these values provide a safety margin in excess of the copper equivalents.

In choosing aluminum cables, it is hard to justify anything smaller than No. 6 aluminum. This is logical when you consider that the smaller the wire, the greater the proportion of total weight represented by insulation. The cost of metal decreases in importance as wire size decreases. Conceivably, a point could be reached where it would make little difference whether aluminum, copper, or silver conductor were used. On the other end of the scale, very significant savings can be had if aluminum is chosen for [fol. 5480] the larger wire sizes. The overall savings by use of aluminum for a large industrial plant built in 1947 was about 40 per cent on nine million feet of building wire.

The manufacture of insulated wire and cable with aluminum conductors follows essentially the same pattern and uses the same equipment as does insulated wire and cable with copper conductors. Manufacturing experience to date shows there are no special insulating problems.

The long-range outlook for the cost of insulated aluminum conductors is for a continually increasing advantage over comparable copper cables.

The basic economics of the product—supply and cost—seem, therefore, to dictate that now is the time for conductor manufacturers and users to look to aluminum.

Design

The techniques used in designing with aluminum are almost the same as those with copper. It is recommended practice to design an installation with aluminum from the start, rather than substitute aluminum for copper at a later stage. Too often the mere substitution of aluminum for copper in a layout results not only in "overdesign," but very frequently a false economic picture that denies the user the best possible application for the least expenditure. [fol. 5481] The rule-of-thumb use of aluminum two A.W.G. sizes larger than copper should be avoided, if the good characteristics of aluminum are to be fully realized. The current carrying capacities of aluminum conductors are established by the National Electric Code, Tables 1a and 2a, for the various classes of insulation. The "spread" of use for any given cable size often permits size-for-size replacement of copper by aluminum, where service is to be in the "overlap area" of the two conductors.

Insulations. Aluminum conductors are manufactured with the same variety of insulations as copper conductors. Unlike copper, aluminum does not have a deteriorating effect on rubber insulations which is particularly a problem at high temperatures. The de-rating factors for temperatures above 30°C listed in the National Electric Code are the same as those applied to copper.

Conduits. Larger ducts are not always needed with aluminum. For example, where the diameter of the conductor itself is small compared to the overall cable diameter, as in the case of high voltage cables, increased duct size is frequently unnecessary. Another typical situation is where the comparable copper cable diameter is at the beginning of a given range of conductor diameters suitable for a particular duct size; the larger aluminum cable generally falls within the range of diameters of cable that may be installed in the duct.

[fol. 5482] Comparisons for three single-conductor, 600-volt, rubber-insulated, neoprene-sheathed network cables of approximately the same current-carrying capacities and reactances, installed in underground conduit, will show this:

Copper Cable		Equivalent Aluminum Cable	
Size	Conduit	Size	Conduit
#6	1¼"	#4	1¼"
2	1¼"	1/0	2"
1/0	2"	3/0	2" *
4/0	2½"	350 MCM	3"
350 MCM	3"	500 MCM	3" *
500 MCM	3"	750 MCM	4"

* No increase in conduit size required.

Since voltage drop is often the determining factor in the selection of wire sizes, the difference in voltage drop between cables in magnetic conduit and those in non-magnetic aluminum conduit should be considered at the design stage to realize maximum savings from the use of both aluminum cable and aluminum conduit.

Installation

Aluminum cable is installed using essentially the same methods and tools as for copper cable. More care is required in making up connections, but this is generally offset, especially in the larger sizes, by easier handling of the aluminum cable—which weighs only about half as much as the equivalent copper cable. The use of lighter weight [fol. 5483] aluminum eliminates from the job some heavy rigging for handling, and much of the backbreaking labor.

Use of Joint Compound. Aluminum is a high conductivity metal and the thin oxide coating which quickly forms on it after manufacture is highly resistant to corrosion. However, this oxide is also an electrical insulator, and must be removed from the surfaces to be joined, in order to make a good electrical connection. This oxide is easily removed by abrading the surface with emery cloth or a wire brush, after first coating the surface with a grease-type joint compound which excludes air and prevents re-oxidation. It is important that connections be made in this way. If they are so done, the resulting connection will be of low resistance and trouble-free, provided, of course, that suitably designed accessories are properly installed, as outlined later.

An electrical connection to aluminum should never be made without joint compound. There are a number of good

compounds on the market, such as Alcoa No. 2 Electrical Joint Compound. The principal purpose of the compound is to protect the surfaces to be joined from oxidation. It excludes air from the surface during abrasion, and continues to protect the termination after it is completed. Some of the joint compounds on the market have metallic or abrasive powders included in the grease to aid in breaking down the oxide on mechanical compression and aid in producing a high conductivity joint. The primary purpose of the compound—to exclude oxygen—should be kept con- [fol. 5484] stantly in mind.

Connectors and Terminals. Aluminum connectors and terminals should be used with aluminum conductor wherever possible. If high operating temperatures are anticipated, and if steel or copper bolts are used in connectors, they should be made up with effective spring washers, such as the Bellville type, to provide for the greater thermal expansion of aluminum. If steel or copper bolts are used without spring washers, any heating from high loads or high ambient temperatures may cause deformation of the aluminum, resulting in a loose connection of higher resistance upon cooling.

Complete lines of good, dependable connectors and terminals for aluminum are available from the major manufacturers.

All approved types and sizes of compression terminals and sleeves made of aluminum give excellent results. Many of these have joint compound installed at the factory, to speed and simplify installation.

All types of mechanical bolted connectors are available in aluminum. Plated steel or copper bolted connectors can be used if satisfactory spring washers are included in the bolts where high operating temperatures are anticipated.

Probably the best electrical joints, especially in the larger sizes, are made up by welding. A complete line of welded [fol. 5485] lugs and terminals is available for virtually all cable sizes 1/0 and larger.

Service Record

Aluminum conductors have been used with success in all types of power service—aerial, conduit, duct, and direct-burial installations. In a five-month period in 1947, one

company shipped about one-half million feet of insulated aluminum cable, representing over 200 individual items, to 70 industrial plants and utilities throughout the United States. The bulk was in sizes 1/0 to 1,000,000 cm. The voltages ranged between 600 and 15,000 volts. A survey made after about four years of operation disclosed that no difficulties had been encountered with the cable itself.

The largest single user of insulated aluminum cable is the aluminum industry itself. After making several pilot installations over a period of years, in 1946 Alcoa adopted insulated aluminum conductors as standard for all new construction and all maintenance installations. Since that time, Alcoa has installed over 40 million feet of insulated aluminum conductors. Other major aluminum producers have also standardized on insulated aluminum conductors. It is estimated that the total insulated aluminum cable in service in the aluminum industry alone exceeds 100 million feet. This attests to the reliability of service that may be [fol. 5486] expected with aluminum cable, since so many operations in the aluminum industry depend upon uninterrupted power, maintenance of which could not be compromised by decisions unrelated to the dependability of the product.

A change-over from insulated copper to insulated aluminum conductor imposes no major problems. It merely requires that the user follow the same sound engineering practices, making the minor changes in technique that follow naturally when one metal replaces another. The changes are small; the savings are large.

Rome Cable

Division of ALCOA

Application for Consigned Stock Approval

(Note: This form to be completed by Sales Office and signed by Manager of Rome Cable Division Sales.)

Application is hereby made for approval of consignment as indicated by the following statements:

1. Distributor Kingston City Electric Supply Company, Inc.
2. Street Address 21 Grand Street
   City Kingston Zone: State: New York
3. Investment and Sales Data.

	Investment: Approx. Consignment Investment Requested	Sales: Actual Last Calendar Year	Actual This Calendar Year To Date	Estimated Next 12 Months
Copper Wire & Cable	7000	45,000	.....	45,000
Aluminum Wire & Cable	1000	4,500	.....	5 to 6,000
Aluminum Accessories	None	.....	.....	.....
Aluminum Conduit	None	.....	.....	.....
Total	8000	49,500	.....	50,000

(Note: Above actual and estimated figures should include Rome and/or Alcoa sales.)

4. Anticipated turnover 3-4 times per year.
5. Distributor now has consignment from manufacturers as follows:

Copper Wire & Cable	Aluminum Wire & Cable	Aluminum Accessories	Aluminum Conduit
None	None	None	Alcoa
.....	.....	.....	.....
.....	.....	.....	.....

(Indicate name of consignor under proper heading.)

[fol. 5488] 6. List *all* Rome Cable Division distributors in this distributor's same trading area. Indicate with (*) if distributor has Alcoa—Rome Cable consignment.

Mid Hudson Electric Supply Corp.*
Poughkeepsie, New York

7. Type of product for which consignment is anticipated (Indicate by check mark):

Copper—		
	Bare & Weatherproof	X
	Bare & Weatherproof (Carton)	X
	Building Wire	X
	SE & Self-Supporting	X
	Machine Tool Wire	.....
	Portable Cords and Cables	.....
	Mining Machine Cables	.....
	RoMarine-RoPrene—Type USE	X
Aluminum—		
	Accessories	.....
	Covered Line Wire	X
	Multiplex Service Cables	X
	Bare Aluminum & Bare ACSR	.....
	Aluminum Rigid Conduit	X

8. Remarks (Explain any circumstances you feel are pertinent to the desirability of this consignment):

At the present time we do not have a distributor in Kingston. It is felt that the addition of this outlet will result in adding about $60,000 to our volume without disturbing our present distribution set-up at Poughkeepsie

Signed , , Manager, Rome Cable Division Sales.

[fol. 5489] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 234

Aluminum Company of America

Ralph O. Keefer
General Purchasing Agent

Pittsburgh 19, Pa.

December 12, 1951.

Mr. A. D. Ross Fraser, President,
Rome Cable Corporation,
421 Ridge Street,
Rome, New York.

Dear Mr. Fraser:

I am sorry for not having written to you sooner as a result of our telephone conversation of several weeks ago when you called me regarding the inquiry for aluminum cable for the Wenatchee and Rockdale projects. We were much slower in finally disposing of this inquiry than we usually are; however, there were many ramifications involved due to the aluminum situation in general and further because some vendors are drawing aluminum while others are not. I was, however, glad to see Rome in the final go-around for at least part of the cable that was up for purchase at the time.

One thing about the negotiation, however, that was somewhat baffling to me was the fact that you were rather competitive on the smaller sizes; i.e., 8 to 12, whereas on the larger sizes you were not too competitive. Perhaps as you gain additional experience in the insulating and handling of aluminum this situation will right itself, and you will be more competitive in the larger sizes.

With respect to the electrical conductor situation in general, we recently heard something that was somewhat disturbing. I understand that your Mr. R. A. Schatzel, who was Chairman of the symposium on polyethylene-covered wires and cable at an AIEE meeting in Cleveland, recently

made the statement that the new aluminum reduction plants could not produce conductor metal, and therefore the addition of these new plants would not relieve the electrical conductor situation. Apparently this opinion was handed down by someone in Washington who is not familiar with the facts. The facts are that any aluminum reduction plant can produce metal suitable for electrical conductor if the proper metallurgical control is maintained. It is therefore a matter of choice to some extent anyhow whether an aluminum reduction plant or a portion thereof does or does not produce metal suitable for electrical conductor.

[fol. 5490] At any rate, all of our plants, present and contemplated, can produce electrical conductor metal if we elect to so operate them.

We think, therefore, that the increased capacity that will come into production in the next few months is going to relieve the present aluminum shortage and that there is a very bright future for aluminum in the electrical conductor field. Principally the economics should motivate it, but perhaps the present and probable continued shortage of copper will be the most dominating influence.

If we can add any information or data for the benefit of Mr. Schatzel or anyone who may have misinformed him, we would be glad to be given the opportunity.

With kindest personal regards, I remain

Very truly yours, T. O. English.

"Copper or Aluminum"—G. E. Rolston

We will mail to you shortly a copy of Aluminum Magnet Wire Price Sheets. I wish to call to your attention the new case price of 60.01¢ per pound. The quantity discount from base is based on 5,000 pounds, compared to 15,000 pounds for copper and is 2½ cents per pound as compared ¾ cents per pound for copper. The adders have been multiplied by a factor of 3.3 times the adder for copper magnet wire. This pricing structure is based on the theory that we should receive the same dollars per thousand feet, (no pounds) for covering any given metal. In other words, it costs us the same amount of money disregarding scrap, which is negligible, to cover 1000 feet of a given size of aluminum as it does to cover the same size copper conductor. Machine speeds are the same, the amount of covering is the same and for all practical purposes all cost factors, such as labor, expense and overhead are identical for performing our work on a per-thousand foot basis.

This brings up the subject of pricing insulated cables having aluminum conductor with any type of insulation and covering. Here, also, we maintain that we should receive the same dollars for performing our services for covering aluminum as we do for covering copper. Taking into consideration the slightly lower cost in freight because of the reduced weight, we have factors that we use and, without going into exact details, to price a piece of aluminum cable, we use the following method. For example, to price a quantity of #4/0—600 volt RR cable—first we subtract from the selling price the price of the #4/0 copper conductor. The remainder is the dollars we receive for covering the conductor with 5/64" RoMarine insulation and 4/64" NeoPrene sheath. We believe we should be paid the same dollars and cents per thousand feet to cover #4/0 Alu-

minum, so we merely add the selling price per thousand feet for the insulated and jacketed aluminum cable.

Unfortunately, there is some indication that other manufacturers in the industry either do not agree with this formula or are not cognizant of the effect it will have on a profit and loss statement. There is a price sheet in the industry today that lists #4/0 Type RR cable—aluminum conductor at a selling price cheaper than the selling price for #4/0 RR cable copper conductor less the #4/0 copper conductor. In other words, some manufacturer is apparently willing to cover #4/0 copper for a given figure and #4/0 aluminum for a much lesser figure. This simply does not make sense economically, and if there is a great swing to aluminum conductor and this pricing policy was followed, there simply wouldn't be enough dollars at the end of the year to meet all our expenses.

With this 43 cent plus copper market that we now have, you will find when you return from this meeting a greatly increased interest in aluminum wire and cable of all types. U. S. Rubber is still promoting RH-RW and TW Aluminum Building Wire, including the branch circuit sizes. We, as a company, have not promoted Aluminum Building Wire and have not announced that we are in the Aluminum Building Wire business. If, and when we do, however, we would prefer to manufacture size #2 and larger—however, we may be forced to go to #6, but in no event will we manufacture aluminum building wire in the branch circuit sizes —#8, #10, #12 and #14.

[fol. 5518] We feel that the end user should be experienced in the use of and handling of aluminum building wire and that this is not the case with some of the people that are working with branch circuit wiring. Generally, an electrician using #2 and larger will be a qualified, competent electrician, trained in the use of aluminum conductor and the chances of getting into trouble are, of course, less. For example, Alcoa, who have had as much experience in the aluminum building wire field as anyone in the country, have experienced difficulties in the branch circuit sizes with respect to connectors, and so on.

We realize that you are being asked what our thoughts are as far as aluminum conductor is concerned. The only information that we will give to a customer will be of a

very basic and fundamental nature, and it will have to be up to your customer to make the decision as to whether or not he wants to use aluminum in the place of copper. There are certain problems of installation and connectors and things of that nature that will have to be solved.

In summary, Mr. Rolston stressed that, if the swing to aluminum conductor increases to any great extent within the next three to five months, we will have a difficult time in securing enough metal to keep up with orders. In view of this, he asked that any inquiries for large amounts of aluminum for delivery within the next three to five months to be referred to Rome before acceptance.

Rome Cable Corporation

1958 Sales Conference

C. H. Ellis—Production Highlights . . . and Lowlights

What I would like to do is brief you as well as I can on the happening since you were here last because I feel there has been a lot of progress. I feel that this down-turn that we had, some of the changes in our labor relations, and the attack on costs may have been one of the finer things that could happen to us. You know it is difficult to make changes when you are loading all of your equipment and your manpower. When you have enough time to breathe and select and do some of the things that Jack brought out from the "Wall Street Journal", you find that you can get ambitions to do a lot more than you possibly thought before. Basically we would like to discuss the area that you occupy here.

We told you last year that when the Engineering building was completed, the Lab went into their Gold Coast, that we were going to try to assemble our operations from 3 blocks into 1 where we could make decisions with the flexibility that was required. We found that being so far

apart we couldn't actually get first things first on a day to day basis and that's what you will have to do in these times. We realize it. Ross has preached that we must be flexible and I know this sales group is finding that out just as much as we are. I want to assure you that we have tried to help.

Now basically in this building now, we have our top operations group right in the center, we have our industrial engineering and our mechanical engineering on this top floor on either side of us and downstairs we have the production programming, the personnel department, and we have the technical supervision section along with the production supervision. It only takes a moment to assemble the heads of all of those departments and make decisions and it is certainly working out excellently. Now in doing this lay-out, we made some analysis which runs into the cafeteria section and in the cost saving requirements, we found that that was quite a heavy cost. Actually, our estimates at the present time in physical cash lay-out runs between 35 and 50 thousand dollars a year saving and in man power saving assuming only 10 minutes per man and that is a very small amount of time to estimate that we had lost per man under our old system, it runs to another 50 to 70 thousand dollars a year. It just happens to be one of the things as Jack mentioned, about transportation costs. One of the things that he spoke of in our new scrap handling set-up. It is surprising how you can have high cost operations that are amenable to analysis and elimination. In our personnel, the changes have been minor in content and major in application. Lee White came from the Lab and took over the technical supervision. He has eight men under him which includes a plant chemical control lab and raw material control and a compound mixing lab. Those were originally a part of laboratory control. In addition he has his trouble shooters and is getting them trained, and himself trained, to cover the whole plant effectively.

In our relationship with the laboratory and the engineering department, we are coming to an excellent understanding of the responsibilities of each and I believe it is showing results. As Mike Popchik and Sid Mills said, I think that we are getting good, and we will get much better application of the needs for new products, the lab developement in getting into the swing of plant operation which will

certainly give you people a better service and a better product. We have had a lot of new products in the last eight months. I will discuss some of them a little later when we get into departments. Austin Woolley, who had the technical supervision, is now assistant to Bill Jones. Bill is retiring the first of the year, and Frank will have a man, [fol. 5520] over in that very important rubber covered and plastic section, that has a good, broad, technical background and also a good production and personnel background. It is part of the plans that were laid out several years ago. We have moved some other people from the technical supervision sections into operations and in this way, we feel that we are going to improve our personnel. As some of us are getting a little older, we are very, very cognizant of the fact that we want to leave the plant in good strong new hands. I look down this particular sales group; I see a great many that are my contemporaries; I see the younger group and I even see the second younger group coming in and those are the boys both in sales and production that we are all going to rely on.

Now for equipment development plans, we take our first basic fundamentals of the rod mill. The rod mill is not a large department. It has varied since we started from 23 to 30 men depending upon the increased production that was developed and we have added new equipment. We have added a coil tier that is new. There are only about two or three of them in existence and we still have bugs to work out; but, it saves us a great many man hours. A year ago it took 27 men to operate the mill. As of this moment, we are operating with 20, and a saving of 7 men in the rod mill is a lot of money. That is a high paying place. Probably 6 or 7 thousand dollars a year, depending upon the overtime. We do have problems as far as meeting all of the technical requirements. Some of it is inherent with the type of operation. It is one of the problems that Rudy has; to see if there is a better way to get a copper rod from a wire bar. We have had some experience in aluminum and continuous casting, and we can see a lot of advantages. The problem of ends on rods as they are fed into these rolls is difficult. There were many improvements and savings there.

In the bare wire, the most notable change was the divorc-

ing of the die shop from the bare wire operation and putting a supervisor, a trained and well adapted man, to head up the die shop and we are now making our own diamond dies and establishing much better standards for all of our dies. We were fortunate in getting Billy Roux, who ran his own die business, his whole family has a background of dies from the old Rome Wire Company, and it is a notable improvement in our ability to get economies and better quality. Also in that department of bare wire, we are replacing our small stranders. That may not mean so much to you, but it does to us because of the increase in instrumentation cable business and the added requirements for the small strands that has developed. We have additional units and more that will be ordered. We have also, at long last, approached a large package of fine wire overcoming the technical problems of payoff. It is our feeling that that is definitely accomplished and we will be into the large package of fine wire in a very short time. We are in our own operations, and it is now just a matter of getting spools to supply our customers. We are now talking about 40 and 50 lb. packages of #30 and finer.

The aluminum department—we have our ups and downs due to the aluminum business in general, but as far as operation is concerned, it has been quite satisfactory. From our Properzi process, with a notable improvement, we are able to produce for our own use and supply, when we have need for it, a 4,000 lb. package of aluminum rod. That's equivalent to roughly, 12,000 lbs. of copper and that is a heck of a lot of volume. This is a very economical way for your customers to handle aluminum rod as we have certainly found out. We are in a position to supply this package, and would recommend consideration of it by any of [fol. 5521] your potential customers—at least on an experimental basis. We can see no reason why it should not ship well. We have also developed the payoff rack to handle these 4000 lb. coils, which could be supplied to your customers at a reasonable cost.

We would now like to take up the Rubber Covered and Plastic Department. When you visit this department you will see the large 44" cabler which will be ready to operate within a few days, handling high number multiple conductor instrumentation, telephone, and certain con-

trol cables. This unit is supported by 30" cablers which are the base assembly for 4, 5 or more conductors which we finally assemble in the large cabler. There are two of these that are replacing four old vertical cablers, which happen to be one of the types of equipment that I think caused us more trouble in our development of instrumentation cable than any other piece of equipment we have. They were darn fine units to make SJ cord, but they were lousy units to handle the size 18-22 conductor with about a 10 mil wall. They could wreck more than we could really handle. These are out of the picture. We have acquired additional 24" Edmonds twisters to make the pairing. We have put in strand pre-heaters in the plastic machines which is a technical requirement long recommended by the laboratory.

Then we come to our mixing department. I had some very nice compliments from some of the boys that I didn't really feel might have the appreciation for what we are doing in that department. This matter of cold feed has been just about one year longer in coming to a head than we had anticipated. I have always said we were optimists, I have always said we try to get 90% correct, but I think in this one we were only about 50%, but we got it and under the guidance of the lab and Lee White and his technical group, we are making improvements in the mixing time. I think quality standards as of this date, are the best we have ever had and in addition, we have cut the cost $70,000 a year in mixing; and our bogey for the completion of the job is an additional $50,000 which I believe will be forthcoming when the completed job is done. Roller feeds on the CV's—they had man power elimination as the original desire, but quality has proven of equal importance. We have three in operation and they will be expanded to all units. When you get into such things as Butyl and some of the other different compounds we find that the old methods of feed do not work. The surface adhesion of the compounds are different and we do have lots of problems. Mechanical adaptations, such as roller feeds, can improve that. Equipment that we still have to install to complete this particular set-up are four new 1½" plastic extruders. You viewed the prototype in the laboratory. Again, that was a long development. I think probably, Rudy, Mac and I all believe it took a lot longer than it should have, but

we made a lot of improvements that we didn't think of when we first started. The basic idea is in reverse—slow down the production—sounds like a crazy thing, and get multiple units so that we can eliminate re-spooling, so that we can spool finished packages, so that we can provide an insulation that has a higher dielectric, because it isn't under stress at extrusion, so that we can handle very small conductors as you heard yesterday. We know we can handle size 26; and I am quite confident that we will get clear down to size 30 to meet our very tough competition that makes such special cables. We want to get into that business. We will have four of those in production in about a month or a month and a half. One of our other bottlenecks was spiral marking. Those are not the nicest operations in the world. They take a lot of technical control to produce a consistent stripe and you certainly do get into trouble with your customer if you don't have a consistent stripe, and, one that will remain on the wire under any conditions. It has been a bottleneck, so we are doubling our productive capacity. [fol. 5522] These should be ready, I believe, about the end of this month. We have made improvements on the regular tubers because there is more heavy insulation high voltage type that is required and have made improvements in our practices of extrusion by use of vacuum. We are quite sure we can lay on jackets that are extremely accurate concentrically; something that we hadn't really thought that we could do quite as well, up until a few months ago. Lee is actively developing that, for not only that type of cable, but possibly into insulations as well. We are expanding our diameter control equipment.

We are trying to automate within the flexibilities that we have to have for the very large number of items that we have to produce. I was one who applauded quietly when Glenn asked you to take 26 items off your list if you are going to have one more to it. It is surprising the loss of production that occurs with multiple set-ups, due to the number of items. We hope some time to see the statistics and the economics and get a relationship between the pieces of equipment you have and the number of items that have to be produced. I think you have heard, more accurately than I can give you, information about the flat and square enamel equipment. You saw it; its been a technical devel-

opment and I believe that we are just about ready to take over. We have had our problems. Fortunately, some of the problems on our base wire had plenty of lead time to resolve the new flat rolling equipment that we developed last year and which has stood us in such good stead for the Simplex type of very accurate flats. That information, development of edging molds, is quite helpful and also the cleaning of those flats is quite helpful in our development of enameled flats and squares. I think we can satisfy you when we get into operation for you.

Jack mentioned the copper scrap. That was a very funny thing. We had heard that at least one company had eliminated the baling and burning of scrap. Sometimes you can make as much money on your salvage as you can on your product and with the low prices that we have, salvage operations become quite a good savings item. We have another problem, of course; that is the area problem, as we had our scrap department right in our oldest building and in a long range view, we are always looking towards elimination of that old high cost maintenance building. You probably saw out in the mill those large containers that we have. Jack did a fine job in working out with our copper people the way in which we can handle it and we now just take these containers and send them right over to the car, dump them in, pile them, push them, separate them, and we do not have all that manual job of separating, burning, baling, assembling the loads; it's all out in one crack. We can keep our plant cleaner, we can give Jack a better turnover of scrap and we make very, very fine savings in the whole operation.

A little data on labor savings. We realize that we must have more efficient methods of operation and have made some notable improvements. We tried to assemble some way to graphically put it to you. In the first place, during the downturn in business from October 1957 to April 1958, we laid off 220 employees. October wasn't the high point in our employees of last year, but it was the beginning of the heavy downturn. We have put back approximately 170 of these. That has helped our labor relation problem exceedingly. But, as far as the number of employees, we tried to pick out during last year, a month that might be comparable with this year and analyze it, good or bad, as

to either our savings in labor or excess use of labor. We found that April 1957 had about the same productive out-[fol. 5523] put in the two main departments of the rubber covered and plastic as June of 1958. We used these two combinations to analyze. In the first place, the rubber covered and plastics as far as the manpower utilization for output, using 100% for April of 1957 went up to 112.3% for June of 1958. The general out-put was the same, but we do know that the complexity of the cables manufactured in June of this year was greater. In other words, we actually required more man hours per pound of copper and aluminum in this year than we did last year, but we still had a 12% improvement. In the number of people who are in these two departments, we had 319 for the same general out-put in April 1957, and only 257, or saving of 61 people in June of this year, of operation.

Now some of these changes that I have told you about equipment have been accountable for some developments of industrial engineering, namely a workload method of analysis, getting more work out of people. Elimination of cafeteria is some of it. But it does make a sizeable improvement. I am very happy that we had some of these improvements when we had the price situation or it would have been even worse. I don't mean that, by any means, we are finished. Jay has a cost reduction section integrated with two other sections and hypothetically we have a lot of places to still attack. Service departments dropped from 308 to 261 men for these same two months, or a saving of 47, about 100 less people in the two main operations. I will have to say that our efficiency in our magnet and weatherproof dropped about 15%, mainly due to reductions in orders, making it impossible to get efficient crews to give the service. Rod mill went up 3.7% in these months, but that 3.7 is actually much higher because there happened to be a month of June that we were working out the details of the coil tier. I would like to just refer back a moment to the plastic department and rubber covered. Instrumentation cable has been a beautiful opportunity to fill the mill, to get some activity, to get some experience, and I feel very strongly that with these new cable twisters, with the new plastic extruders, with the new spiral marking and one additional development that we still have to accomplish, is

high speed damage free shielding. We have a lot of improvements to make in that and when we complete that set-up we will have a good opportunity to be one of the first in that growing line of operation. Just one last thing; the relationship between the lab and engineering and the operations. Rudy outlined the theory last year and I concurred. We have had many meetings on it. I believe that when we complete the orientation between these two sections that we will have one of the fastest action product development and factory control organizations in the wire industry.

R. R. Davis—Kansas City

January 31, 1958.
Gesco—Des Moines

Dear Pete:

Attached is an application for a consignment of aluminum products at the General Electric Supply Company in Des Moines, Iowa. This consignment is requested because a certain amount of business has been promised to us through this wholesaler by the Iowa Power & Light Company.

This is the same utility that purchases our products through Interstate Electric Supply Company and per permission from Jack Woods the same prices will apply on the contract which I will receive until the first of July of this year. These prices are based upon the February 15th, 1957 sheet and the cost to the wholesaler is as follows—

Triplex—The maximum price less 15 and 7½ per cent.
Weatherproof—The maximum price less 15 and 5 per cent.
ACSR and Bare Aluminum—The maximum price less 5¢ a pound and 3 per cent commission.

Covered products are shipped only into the wholesaler's stock. Bare products are shipped only direct.

I have hopes and have been led to believe by the utility purchasing agent that although we are starting out in a small way this business should increase appreciably during the coming year. At the start we are going to stock only Triplex and the utility has suggested the following—

30,000 ft. "Carp"
2,000 ft. "Shad"
1,000 ft. "Barricuda"

He should purchase this much each month and in any case has guaranteed to purchase it every two months.

Since we have done previous work on this and I feel assured this consignment will be approved I have told the customer he may place his original order.

The wholesaler has also requested a consignment of our copper products but I have asked him for more data before I pass a request onto you. When this is received I will contact you.

Yours very truly, ——, ——.

January 31, 1958.

Mr. H. B. Heitzman,
General Electric Supply Company,
108 East Fourth Street,
Des Moines, Iowa

Subject: Iowa Power & Light Company

Dear Heitz:

This is to advise that my headquarters in Rome have advised that it will be satisfactory for you to place your first consignment order prior to the signing of consignment agreement. In other words, we feel that the agreement

is routine and so that we might get some of the business in February from the Power Company it might be well for you to place an order immediately.

In accordance with our conversation with Rex Jorgensen yesterday will you kindly make the original order out as follows—

30,000 ft. #4—3/Condr. Aluminum Triplex—code name "Carp" in 500 ft. paper wrapped coils
2,000 ft. #2—3/Condr. ditto—code name "Shad" on 1,000 ft. non-returnable reels
1,000 ft. #1/0—3/Condr. ditto—code name "Barricuda" on 1,000 ft. non-returnable reels

On the face of your order in large type please put "On Consignment". Please send your order to this address.

You will hear from us very soon concerning the signing of a formal consignment agreement.

Yours very truly, R. R. Davis.

Aluminum Price Situation

The following is background on aluminum developments leading to our price authorization of April 22nd. Competitive reports and correspondence substantiating this information are attached to Mr. Rolston's copy.

On March 27th, Stan Williams advised that we had a telephone call from Mr. Granger of Aluminum Limited Sales, reducing pig by 2¢ a lb. Stan checked with Alcoa and Kaiser but could not get confirmation that they would follow.

Alcoa and Kaiser went to 24½¢ EC pig on April 1. Both announced that appropriate reduction in fabricated products would follow shortly.

We revised metal symbol on aluminum orders but made no move to revise prices except on "firm except metals" orders (Detroit Edison and Commonwealth Edison only).

We heard nothing of aluminum conductor price changes and feelers to Alcoa and Kaiser indicated an intent on their part not to adjust prices.

On 4/3, Kaiser advised that they were reducing ⅜" EC rod in standard coils to 28¢ a lb. This reduction made the adder over pig 3.5¢ a lb. as opposed to the previous 8.10¢ a lb.

We received conflicting reports on competition as follows:

4/8—New England advised that Kaiser had reduced list prices on covered conductor by 15%. Bare and ACSR by 3 to 5¢ a lb. This report was revised on 4/9 with the statement that no official list reduction had been made but Kaiser had authorized distributors to use 10% beyond sheet where necessary.

4/9—Atlanta reported that Kaiser had adviced Gesco—Johnston City price on any quantity of covered aluminum was best column less 15% either for drop shipment or shipments to stock.

4/9—Kansas City advised Kaiser reduced Central Illnois triplex contract price by 2¢ a lb. aluminum weight.

4/10 & 4/11—We tried to clarify above reports but could not get proof that the uniform price existed. Detroit solicited several Anaconda and Kaiser jobbers who had not heard of any competitive move on either company. Discussions with Alcoa and Kaiser confirmed that no official move had been made, however, Kaiser stated that they were meeting what they saw.

[fol. 5528] 4/14—Reports from St. Paul on a published opening for municipal on 80,000 ft. of Triplex showed Kaiser direct at list less 15, Reynolds and Southern through jobber at list less 15, Alcoa list less 10 and Anaconda at list less 8.

4/14—Report from Stew Johnston on discussion with Kaiser stated that they are not disturbing contracts with unspecified balances but they are quoting lower prices on new contracts. Could not determine if "new contracts" meant extending coverage beyond June, 1958.

As indicated above, prices have definitely broken but impossible at this time to determine exact level. It would appear that competition is being met as it is seen. We have no exposure to large Bare and ACSR jobs, but rumor is that prices are off 3 to 5¢ a lb.

Since April 1st, we have met a few prices on covered aluminum, but in no case have we offered firm prices beyond June, 1958. See competitive reports attached.

4/16—Kaiser advised two Tennessee jobbers to quote list less 15 on Triplex and Line Wire with normal distributor's discounts beyond. Bare and ACSR 3 to 5¢ a lb. off the sheet, all prices firmed for 120 days.
4/17—Gib Wolfe advised that Kaiser had quoted Aerofin on rods at 31¢ a lb. This compares with our price of 33.10¢ after correction for 2¢ drop in pig. He did not know if this price was based on standard coils or a large package. A.D.R.F. expressed interest in retaining this business. Without definitely committing ourselves to this low price, I discussed this with Gib Wolfe on 4/22 and encouraged him to investigate further with the customer. He will meet with them on 4/23. We furnished Gib with pictures of the 4,000 lb. coil package and asked him to get customer's reaction.
4/17—Bill Miller reports that Anaconda extended aluminum contracts with Eastern Shore through 1958.
4/18—Ted Stokke reports that aluminum contracts with Northern States Power have been extended through 1958.
4/19—Received positive evidence that Alcoa sold jobber for a utility, Neoprene Line Wire at list less 15 and 7½, per authorization of 2/28/58.

[fol. 5529] Based on the above, we made the move as outlined in my telegram of April 22nd. A cost study based on more popular items of Triplex and Line Wire indicates that current lists less 15% is just about our cost.

Very truly yours, ——, ——.

Mr. R. S. Keefer, President,
The Okonite Company
Passaic, N. J.

Dear Stu:

I can well understand the good and sufficient reason for not being able to discuss the very important news released yesterday.

Congratulations to both you and Al. for the excellent arrangement you have made for your share owners. I think congratulations are due to Kennecott for acquiring such a fine organization as you and Al. have working with you.

The ranks of good independent companies are rapidly diminishing.

Please convey to Al., and the others in your fine organization, our sincere congratulations on this important step for all of you.

Kindest regards.

Sincerely, ——, ——, President.

Re: Covered Conductor Forecast

I am attaching a copy of a forecast of covered conductor business for 1959 which I prepared with the assistance of Mr. Kehew. This forecast may be considered conservative since I followed the graphical trends of present business conditions. It is a well-known fact that in late 1957 and the major part of 1958 there were economic factors which upset covered conductor business as well as general business. Trade papers and magazines indicate that most economists predict expanded business conditions for 1959, although there are some who feel that there will be a leveling off of business, i.e., neither a peak nor a downward trend. The graph that I used would indicate business conditions somewhere between these two.

I would like to call your attention to the last tabulation which indicates a change from open line wire for service drop to triplex and also a change from open line wire to secondary cables. When changes are being made from open line wire to service drop, I would expect the normal percentage break between neoprene and polyethylene to apply. However, when changing from open line wire to secondary cables, I expect the majority of this to be neoprene since most power companies want to maintain service at all costs on their secondaries; and neoprene admittedly will stand higher temperatures before failure than polyethylene.

Another trend that may influence your selection of a [fol. 5532] twister is that of increased sizes of triplex both

for service drop and for secondary cables. I expect increased use for #2 and 1/0 for service drop and increased use of 4/0, 266,800 cm and possibly larger sizes for service cables.

I feel very strongly that cross-linked polyethylene will cut into both regular polyethylene and neoprene sales as soon as the patent situation is cleared up. Even after the patent situation is cleared up, there will be a little time lag in education of the general public; but since we are considering purchasing new equipment, I think we must take cross-linked polyethylene into consideration in our expansion plans.

L. T. Guess.

Internal Correspondence

Jan. 30, 1959.

From: F. L. Magee, Pittsburgh Office
To: Mr. P. T. Coffin, Pittsburgh Office
Re: Accurate Insulated Wire Corporation (Johnson Machinery Company—Newark, N. J.)

Attached is Mr. Joseph Leonard's letter of January 26th, which is self-explanatory. Mr. Leonard had previously phoned me as a result of his reading about our acquisition of the Rome Cable Corporation. He said his company had exclusive rights to the sale of the Accurate property and equipment for the production of insulated electrical conductors.

I inquired as to the reasons for this company being sold, and he said that it came out of a family squabble. As I get it, some of the older generation passed away and the younger generation could not get along. As a result, he said the plant had been shut down for six months.

I don't know whether the plant is for sale as is, or whether some of the equipment could be purchased separately. If we are interested, of course, Mr. Leonard seems to be the man to reach.

I am also sure that it will be obvious to you there could be some interest on the part of the Rome Cable Corporation, and if they do not already know about it, you might want to pass the information on to Ross Fraser for whatever it is worth to him.

Re: Accurate Insulated Wire Corporation (Johnson Machinery Co.—Newark, N. J.)

I attach to this letter Mr. Frank L. Magee's letter of January 30th to me, a letter dated January 26th, 1959 to Mr. Frank L. Magee from Mr. Joseph Leonard of Johnson Machinery Company, and a notice of sale of the equipment together with a brochure describing the equipment in the Accurate Insulated Wire Corporation at New Haven, Connecticut.

We had known for sometime that Accurate Insulated Wire Corporation was out of business, but we were not aware of the fact that the equipment was for sale.

I can see how there might be a very good possibility that after we acquire Rome Cable Corporation, certain of the equipment in Accurate Wire might be very useful in expanding certain of our operations or be useful for cannibalizing such equipment when and if we and Rome Cable appraise our joint manufacturing assets. I suggest, therefore, that the proper person in our Purchasing Department write Mr. Leonard a letter phrased in such a way as to not stir up the animals particularly, but to keep Johnson Machinery Company "on the hook" to some extent until after the Rome acquisition will have become a figurer complet, and after which time we can sit down with the Rome Cable people and look into the matter with a much more practiced eye than ours.

Perhaps you do not agree with this procedure. If not, of course, I shall be glad to discuss the matter with you, but

in any event the letter to Mr. Magee deserves a prompt answer.

Philip T. Coffin.

Re: J. R. Richards Company, Carnegie, Pennsylvania

Mr. Hack McCullough invited Ralph Davies and me to have lunch with him about two weeks ago, and it turned out that he was interested in two subjects. One was the proverbial request that we look into giving McCullough Electric an exclusive Alcoa distributorship for its electrical products. This, of course, was pushed off as in the past.

The second subject, however, was of an entirely different nature. Hack pointed out that J. R. Richards Company was a manufacturer of steel conduit boxes and associated fittings such as nipples, nuts and washers. It is a family owned affair and one which he felt could be purchased at a very reasonable price. He added that he was drawing it to our attention because he felt sure that Alcoa would be in the business of making aluminum boxes and associated

fittings and that the acquisition of J. R. Richards would be by far the best and quickest way for Alcoa to get into the business.

I have looked into the matter somewhat and find that J. R. Richards is indeed a closely held family affair. Mr. J. R. Richards, who Hack says is in his sixties and probably about ready to retire, is president. Mrs. J. R. Richards is secretary and Mr. J. R. Richards' brother, Harry Richards, is sales manager. A Mr. Charles Crouch is treasurer. The company was formed about ten to twelve years ago with capitalization of $150,000.00—1,500 shares at $100.00 each. The report I saw did not state whether all of the stock had been issued. In 1958 sales were about $1,000,000.00, and earnings are reported to be satisfactory since the company's [fol. 5539] inception. It has a net worth of about $250,000.00.

The company has its main plant in Carnegie—a rather neat operation that I drove by a few days ago—and another operation of some sort on the outskirts of Bridgeville which I have not yet seen. Hack has been after me several times to know what action Alcoa proposes to take and states that if we do not buy the company, it will either be sold to someone else or be dissolved.

Dixon Lewis and I are both seeking the best advice we can as to what recommendation should be made in regard to such an acquisition. The purpose of this letter, therefore, at the moment is purely informative, and I hope to have recommendations ready within a week or so.

I have discussed this matter briefly with Mr. Hickman. In his opinion if we were to make this acquisition it would not prejudice our acquisition of Rome Cable Corporation with the Department of Justice, both because the company is small and has virtually nothing in common with either Alcoa or Rome Cable Corporation.

Massena Fabricating Works
Mr. A. G. Church
Pittsburgh Office

Re: Copper-Coated Aluminum Wire

On June 23 Messrs. W. F. Lowry and John Havrila visited Massena for the purpose of discussing what we could do to provide samples of insulated bunched conductors for trials at the American Insulated Wire Corp., Division of Leviton Mfg. Co. During their visit they spotted some of the copper-clad EC wire fabricated by cold drawing copper tubing over EC rod.

Mr. Ben Leviton has been interested for some time in such a product for application in the missile field where reduction in weight is of considerable importance. Another requirement for this application is the ability to readily solder joints.

I suggested Mr. Lowry write to Messrs. Miller and Coffin and acquaint them with this potential application. A copy of Mr. Lowry's letter of July 1 to Mr. Miller is attached. Leviton would be interested in purchasing 5/16" dia. redraw rod for their wire drawing operations at American Insulated Wire Corp.

On July 1, I discussed the possibilities of making this product with Mr. George McCutchan, Director of Research, of the Rome Cable Corp. I suggested that we employ 4" dia. copper tubing filled with EC molten aluminum. The thickness of the copper cladding would be approximately 10% of the cross-sectional area. These copper clad EC billets could then be heated to approximately 950 Degs. F. and rolled into 5/16" dia. redraw rod on the Rome Mill. Mr. McCutchan indicated that the length would have to be

held to a maximum of about 40" to fit their furnace equipment which normally operates at 1750 Degs. F. He was [fol. 5542] dubious about their ability to roll such a combination at 950 Degs. F., but agreed to review the matter with the rest of their organization and let me know whether such a trial could be conducted at Rome.

Since copper seriously contaminates our rolling and drawing equipment, resulting in numerous embedded particles of copper in the subsequent aluminum production, it seems desirable to consider the fabrication of this item at Rome where copper is rolled and drawn on a routine basis.

Assuming Rome is agreeable to a trial of this product, Massena will be glad to procure the necessary copper tubing and fill it with molten EC. I will keep all concerned advised when I hear from Mr. McCutchan.

CLK:B C. L. Kessler.

PLAINTIFF'S EXHIBIT 258

To: All Salesmen
From: D. H. Thayer-Rome
Date: December 8, 1959
Subject: Aluminum Building Wire

You have received Distributors' net price lists on items of Aluminum Building Wire and published list price sheets are now ready for distribution to the trade. The issuance of these price lists signals our entry into the insulated aluminum conductor market *to the extent of the building wire types of construction.* Specifically this activity is to include, and currently be confined to the following types:

Type RHW—Braided
Type TW
Type SE, Style U
Type RHW—Neoprene, Style *RRD*

Kaiser and General Cable have published list prices in the hands of the trade and it is my belief that Anaconda will, also print sheets. Published Distributor's discount is 20 per cent. However, in meeting the present competitive practice applying to copper conductors you may quote Distributor's discounts of 20 and 5 per cent for outright purchase.

Branch Circuit Sizes

You will note that our published list prices for Types RHW—Braided, TW, and RHW—Neoprene, RRD cover sizes *6 Awg. and larger only.* This is by design. Our attitude toward branch circuit sizes 12 Awg., 10 Awg. and 8 Awg. will be one of sales resistance. It is not our intention to publish prices for this sizes. Stocks of these small sizes will not be maintained and we have no desire to solicit or accept orders for them. I believe it is generally acknowledged that no real economy results from the use of aluminum conductors in branch circuit sizes and that you will find our attitude in this respect in keeping with that of competition.

Maintenance of Stocks

It will not be our policy to consign insulated aluminum conductors in the Building Wire types referred to above.

A Rome factory stock of aluminum Type SE, Style U Service Entrance Cable has already been authorized. Similarly, stocks of Types RHW—Braided, TW and RHW—Neoprene, Style RRD will be authorized for regular maintenance at the factory.

We recognize the fact that stock availability at Stock Redistribution Points will be essential in the sale of aluminum Building Wires. However, we have no good criteria for the establishment of such stocks. Proper stock quantities and sizes will be indicated only by experience and will depend upon the extent to which copper conductor sales are [fol. 5544] converted to aluminum. Therefore it is asked that each Stock Redistribution location make the best possible analysis of its expected aluminum activity before entering stock requisitions on the factory. In placing stock requisitions we beseech your best judgment with regard to sizes and quantities ordered.

Based upon present Mill Condition, it probably will be some 7 or 8 weeks before stock becomes available here at the factory.

Our entrance into the aluminum Building Wire field implies, of course, the availability of promotional literature, technical assistance, conversion information, etc. These matters are now in the planning stage and will become a part of an aggressive building wire conversion program as time goes on. They will be developed and put into your hands as quickly as possible.

I should like to add that our activity and interest in the aluminum Building Wire field will be considerably influenced by the degree of stability (or lack of it) applying to present price levels. You are familiar with the reason for our past reluctance to participate in it.

Very truly yours, ——, ——.

H. J. Fahrney, Pittsburgh Office
Mr. F. W. Conrade, Atlanta Sales Office

Re: Southwire Corporation

In a recent conversation you asked if Alcoa can offer this company a hot metal contract for 1,500,000 pounds per month. At that time I indicated that I was quite sure that this would not be possible. I have since talked with several people in Pittsburgh and find that there are several reasons why a contract of this kind cannot be offered to Southwire. Will you please let us know their comments when you inform them that this cannot be done.

At the same time you also asked whether we can guarantee a maximum iron content of .12% in the 99.5 grade pig we are shipping to them. We have examined the analysis reports of recent shipments and find that we have actually

shipped them some metal with not over .12% iron, but in every case this was done to meet a delivery schedule requested by them. We cannot agree to a maximum iron content of .12% but Mr. Ferguson is making a further study of the grades of pig available to determine whether it is possible to guarantee a slightly higher average iron content, possibly between .15 and .20%. As you know, we now guarantee only that the maximum iron will not exceed.20%. We will let you know about this in a day or two.

H. J. Fahrney.

P-[illegible]

INTERSTATE CABLE ASSEMBLY EQUIPMENT

This Request for Authorization covers the purchase of equipment for the assembly of missile type cables including striping of individual insulated conductors, cabling, jacketing of the cable and attaching mechanical and molded types of cable connectors.

This equipment is now owned by the Interstate Electronics Corporation, Anaheim, California. This company has decided to cease manufacture of these cable assemblies and has agreed to sell this equipment to us.

The acquisition of this equipment will make it possible for us to offer complete cable assemblies to the missile industry. As the manufacturer of these complete cable assemblies the users will have a reliable source of supply and a source which accepts total responsibility for these complex assemblies. The present normal arrangement is for the assembly companies to purchase the cable from a wire company, and purchase and attach the connectors. This arrangement presents a condition of divided responsibility as far as the users are concerned.

Trade sources indicate increasing interest in cable manufacturers getting an arrangement with cable assemblers. We also understand that there has been interest in acquiring their own assembly facility.

Increasing importance of the use of wire and cable for the missile industry has been a matter of interest to us for a number of years. We had another company called to our attention and carefully investigated the potential purchase, which of course could not be signed with the present suit hanging over us. Rome has been penalized in obtaining bulk orders. We have tried, and are trying, arrangements with two cable assemblers but the results have not been as satisfactory as we had hoped. The final establishment of a uniform specification on base construction of bulk cable further emphasizes importance of a producer-assembler connection. The purchase and use of this equipment should materially increase Rome Plant's production as a supplier of the

assembly plant. The equipment herein to be purchased was that of a company with whom we had contractual relations to apply connectors to bulk cable. Their decision to go out of this business was largely influenced by the standardization of specifications on bulk cable, which left them without a direct source of supply. In their going out of the cable assembly phase of their business it is possible for us to make purchase of their equipment and set it up as our own. Decision on this matter was arrived at after very careful exploration and discussion with both sales and technical people. Both Messrs. Bolston and Williamson made strong recommendations towards our doing something to fill in the gap in our ability to properly serve the missile industry. The equipment has been examined by Glenn Koger, Ross Fraser, Robert Bell, [illegible] U.S. Warren and we now have in our sales office in Los Angeles the man who formerly managed this operation.

It is anticipated that our monthly sales of these assemblies will approximate $150,000 and in addition our volume of individual insulated conductors manufactured in Rome will be increased accordingly. As this equipment lends itself to manufacture of prototype assemblies we will be in good position to obtain major orders for new construction as they are developed.

It is intended to lease approximately 20,000 sq. ft. of floor space in a building located near Los Angles warehouse for this operation if this Request is approved.

[fol. 5552] MEMORANDUM 2368

4/19/60

Mr. Fraser assures me that this assembly equipment is exactly what Rome needs to do an effective job in missile-type cables. The Interstate Electronics Corporation has closed down its cable division and its equipment is for sale. A detailed list will be given to Mr. Fraser later and he will make a bid on the basis of this general authorization. If you have any questions I suggest that you telephone Mr. Fraser at Rome and clear the matter promptly. I shall be out of the city for two weeks after this week and I am most anxious to have this Request for Authorization cleared before I leave if we are going to approve it. It seems to me that we have little choice but to follow Mr. Fraser's advice in an item of specialized equipment such as this.

LEON E. HICKMAN

MR. P. H. LARSON

This AUTHORIZATION confirms REQUEST FOR AUTHORIZATION No. RCR-35

Dated April 15, 1960

ROME CABLE CORPORATION (Name of Company)

ROME (Works)

An expenditure in the amount of $ 130,000. as covered by REQUEST FOR AUTHORIZATION of the above number, has been duly approved.

Brief description of the project:

Purchase Cable Assembly Equipment.

I hereby certify that REQUEST FOR AUTHORIZATION bearing request number noted above has been duly approved and is on file in the Fixed Capital Division of the Accounting Department. This expenditure should be charged as follows:

CHARGE to Fixed Capital.

N. R. ALTHAUSER, Controller

Date April 22, 1960

By P. H. LARSON

Copies of this AUTHORIZATION have been issued to the President, Treasurer, Chief Engineer, Director of Purchases, Controller and Messrs. R. A. Hunt, I. W. Wilson, H. C. Erskine, L. E. Hickman, C. H. Ellis, L. B. Kuhns, L. Litchfield, Jr.

[fol. 5555] READ CAREFULLY INSTRUCTIONS ON PAGE FOUR

Describe below the detailed estimated cost, showing separately the cost and kinds of materials, labor, expenses, etc., installation cost being shown as a separate item from equipment or structure. State in general terms the degree of accuracy of the estimate.

Date _____ Date _____

Date 4/25/60 L. D. Fiske, Jr. Engr. Date _____

Date 4/25/60 E. E. Quinn, Controller Date _____

Date _____ Date _____

Date _____ Date _____

Note:—The name and title of the person under whose immediate jurisdiction this request was prepared, must be signed above.

[fol. 5556] **INSTRUCTIONS CONCERNING REQUESTS FOR AUTHORIZATION**

(Revised as of 11-1-47)

1. All Requests for Authorization shall be made in triplicate, numbered consecutively by the Works issuing the Request, and be prefixed by the indicative letter assigned to that Works; two copies should be retained by the Works (one of which is for the Property Accountant and one sent to the General Manager in Pittsburgh having supervision of such Works, who will in turn route it to the proper people in Pittsburgh.

2. On Pages 2 and 4 of this form give an outline of the reason for the expenditure, a detailed description of the work to be done, and a summary of the objectives, as well as other information which may be requested in writing by the Accounting Department from time to time. A copy of explanatory drawings, sketches, photographs, and blue prints should be attached to and form a part of the request. On Page 3 should be shown the detailed estimate of cost for each unit of the work to be performed, broken down to show material, labor, and burden for each item in the estimate.

3. After the Request for Authorization has been duly approved, an Authorization will be issued from the Pittsburgh Office. All Authorizations will be numbered consecutively, regardless of Works submitting the Request, but the number will be prefixed by the indicative letter representing the Works which issued the Request. The Authorization will also carry, for cross reference, the Works number of the Request for Authorization.

4. If, after an Authorization is issued, changes appear to be necessary or desirable in the design, plan or scope of the work, all the facts and a new estimate in the form of a revised Request for Authorization should be prepared and submitted as outlined under (1) above.

5. If, at any time before a job is complete, it is apparent that it will require at least $2,000.00 more than was authorized, to complete the job, a revised Request for Authorization should be submitted promptly. However, no revised Request should be submitted during the calendar month in which a job can be reported complete.

6. Copies of Authorizations are regularly sent or routed to the President, Vice-President in Charge of Operations, Controller, Treasurer, Chief Engineer, Director of Purchases, General Manager of the Division, Works Manager, Works Office Manager, and Property Accountant. Designation of other individuals to receive copies of the Authorization should be made hereunder.

The following questions shall be answered:

1. Was this item included in the Authorization Budget? No Year _____ Item of Budget _____ Amount previously requested against this item _____ Amount remaining after this Request for Authorization _____

2. Estimated date work will be started? See Note . Completed See Note

3. State number of employees to be increased or decreased after this project is completed. Increase: 5 Salaried maximum 50 hourly.

4. Is any equipment or other facility being replaced? No If so, will it be sold, scrapped, or transferred? _____ What is its original cost? _____ Present Book Value? _____ If to be sold or traded in, what is estimated sales value? _____

5. Is any equipment being transferred from another plant? No What is the original cost? _____ Present Book Value _____

6. What disposition will be made of spare parts for equipment being retired? Not applicable.

7. Has any work been done or material requisitioned for this job? If so, explain why. No.

8. What is your expected rate of expenditures? Total expenditure in May 1960

Note: This Request covers acquisition costs only. A separate Request covering labor and materials for dismantling, moving and reinstallation will be submitted provided this Request for Authorization is approved.

Legal

As I told you last Friday on the telephone Lee Hickman before he left on vacation sent me the enclosed data sent to him by Ray Palmer, of the Boston office giving information regarding Suprenant Mfg. Co.

I received the data just as Lee was leaving and as I was about to leave for the Coast. We have known this Company for a number of years and hold them in high esteem. When I talked with Lee about it and I described the product to him he had considerable doubt as to the possibility of doing anything about it in view of the Justice Department's inquiry about Rome, Rea and Alcoa. We have carefully talked the matter over and reviewed their figures and while we recognize them as a "Tiffany" producer in their field, the location and duplication of equipment on many of the products from our present knowledge would indicate that our recommendation would be to turn it down.

If it is your decision that we should look further and visit the plant and do other things necessary to properly check all details we will, of course, be glad to do so.

Ross.

April 13, 1960.

From: A.D.R. Fraser, Rome
To: Mr. L. E. Hickman, Pittsburgh

I am sorry that because of activities that you know about, that the Hitemp data was not returned earlier. I actually carried it to Pittsburgh last week, and had it with me at Ft. Wayne, but did not get a chance to talk about it. Certainly what has happened in the action of the Department of Justice in itself makes the decision quite definite that we cannot do very much about this at the present time. Chief Wilson has already had from Jack the opinion of our technical people and I have gone over it with him and I concur.

I have not returned the copy of the Eberstadt letter as I believe this was merely a photograph of the original letter to Frank Magee, but I will be glad to do this should you wish it.

A.D.R. Fraser.

Re: Surprenant Manufacturing Co.

I note your letter to Mr. McKee under date of March 21st and had a chance to talk to Mr. Fraser yesterday concerning the captioned matter. If and when Messrs. Fraser or Williamson are in the vicinity of Boston, I am sure they would be glad to talk with Mr. Surprenant. However, the pending antitrust suit against the company for the purchase of the Rome assets makes it out of the question to consider any further corporate acquisitions, particularly in this field, as long as the antitrust action continues. Unfortunately, it is more likely to last several years than several months.

Leon E. Hickman.

Re: SPT Cords With Aluminum Conductors

Purpose:

To develop SPT Cord with aluminum conductors and to study the possibilities of the use of aluminum for this application.

Discussion:

The use of aluminum for the conductors of flexible cords would provide an outlet for considerable quantities of aluminum if it could be proven satisfactory for this service. Alcoa has been working for quite some time with the American Insulating Company on the development of SPT Cord with aluminum conductors but the results have been somewhat less than satisfactory because of their inability to work closely enough with them to determine the problems involved in the manufacture of this product. The problem was, therefore, given to Rome Cable to determine if aluminum conductor SPT Cord could be economically produced and to investigate the possibilities of the use of aluminum for this application in comparison to the present U/L approved copper conductor SPT Cord.

Summary:

Samples of #16/2 and #18/2 conductor cord were produced. A preliminary study of costs indicates that a #16 aluminum conductor cord can be produced at a cost equal to or lower than the cost of a #18 copper conductor cord. The question was raised and tests were conducted which show that for this application, the aluminum equivalent may not need to be two AWG sizes larger than copper. If this is true, it would be a further cost advantage in favor of aluminum.

[fol. 5561] A comparison of the performance characteristics of aluminum conductor cord with copper conductor cord shows the aluminum to be relatively poor. The strength of the #16 conductor cord is approximately 75% that of the cord with #18 copper conductor and its flex life is roughly ⅓ that of copper. Underwriter's Laboratories have expressed themselves that for aluminum to be considered for this application, it should perform better than 50% as well as copper.

Procedure:

Sample Development

Wire Drawing—At the start of this investigation it was assumed that the .010" aluminum wire for stranding would be drawn at Rome. Several attempts were made to draw this on the old Rome fine wire drawing machines which had been set up for this purpose. After a considerable amount of work and investigation it was concluded that these machines were unsuitable due principally to slow drawing speed and excessive breakage. .010" EC H-19 wire became available from Massena and wire from this source was used for most of the samples produced. The cost data for drawing .010" wire at Rome, which is shown later in this report, is based on providing Vaughn Ring Blox fine wire drawing machines and assuming that one operator could operate five machines.

Stranding—The .010" wire was bunched before annealing to take advantage of the greater strength of the hard drawn wire. Stranded conductor for the original samples was produced on a New England Butt buncher. After the Cook buncher from Massena became available, all strand was bunched on this machine as it was considered much more suitable. To avoid excessive breakage of the individual wires, the bunching speed was reduced to 50% of [fol. 5562] that used for bunching copper strand. At this speed there were relatively few breaks, but as the machine is not equipped with automatic stops, whenever a break did occur there was a loose end in the strand.

Annealing—The stranded conductor was annealed to ¼ hard temper.

Retipping—The aluminum strand was not retipped before insulating as is the practice with copper strand. Previous experience had shown that bunched aluminum strand is easily damaged by respooling, resulting in broken wires which cause "bird nesting" and conductor breaks at the insulator. Additional study of this problem is necessary.

Insulating—Samples of #16/2 and #18/2 were produced without separator and with paper fold separator. Lengths ranged from 1000 Ft. to 2500 Ft., it being impossible to obtain longer lengths because of "bird nesting" and conductor breaks caused by the loose ends of broken wires in the strand. The samples with paper fold separator were run, for two reasons. It was thought that the use of a separator might solve the conductor breakage problem, but this did not prove to be true. It was also desired to obtain performance test data on the finished cord both with and without separator.

Samples and Preliminary Cost Data

Sample	Size	Strand	Insulated	Cost/M'
1	#18	16/.010" *	.126" x .227"	$ 7.38
2	#18	16/.010" **	.126" x .227"	6.72
3	#16	26/.010" *	.148" x .257"	10.18
4	#16	26/.010" **	.148" x .257"	9.09
5	#16	26/.010" paper fold *	.151" x .263"	10.42
6	#16	26/.010" paper fold **	.151" x .263"	9.31
7	#18	42/34 bare copper	.126" x .227"	9.36

* .010" EC H–19 purchased from Massena.
** 3/8" rod purchased from Massena and drawn to .010" at Rome.

[fol. 5563] Tests:

Overall Strength Test—Samples of the finished cord were broken on the Scott rubber tensile testing machine. The results are the average of three tests.

Flexing Test—Samples were flexed on the Bureau of Mines Flex Testing Machine through an arc of 180° under tension of a six-pound weight. Results are the average of three tests.

Twisting Test—Samples were subjected to a twist test using the U/L twist testing machine for heater cords. Results are the average of three tests.

Results:

Sample	Lbs. Break	Flexing Test Cycles to Failure	Twisting Test Cycles to Failure
#16 26/.010 SPT-1 Al. Condr.	67.5	55	24
#16 26/.010 SPT-1 Al. Condr. with paper sep.	68.0	74	33
#18 16/30 SPT-1 Al. Condr.	39.0	43	16
#18 42/34 SPT-1 Copper Condr.	90.0	369	99
#18 16/30 SPT-1 Copper Condr.	88.0	220	65

The use of aluminum conductor in flexible cords was discussed with the Underwriter's Laboratories to obtain information regarding tests and test requirements that would be involved to obtain U/L approval. They seemed convinced that EC grade aluminum would not be suitable for this service. The proposed test program which was developed previously for American Insulated and Alcoa and which would be followed if we were to submit was reviewed.

a. Breaking strength would be compared with copper. The tensile would be made on uninsulated strand.

[fol. 5564] b. A complete study of the soldering techniques would have to be made in view of the fact that aluminum is reportedly much more difficult to properly solder than copper. In addition there would be a test on the flexibility of the soldered joint.

c. A current flow test through soldered joints would be made which would be for roughly 60 days with a predetermined amount of current flowing. Following the current test the tensile strength of the joint would be made.

d. A thorough study of the compatibility of insulating materials with the various soldering fluxes that might be used would have to be made.

e. Various flexibility tests in comparison with #18 AWG copper would be made. These tests conceivably could range from a simple twist with pliers to the more complex cable flexing machines that we have. A lateral loop test would be involved here also, which is simply measuring the number of cycles taken to break the conductor when two points of the conductor are held a distance of 12 inches apart and these points brought together and separated. This again would be compared with copper.

f. The effects of corrosion on aluminum conductors under various atmospheres would be investigated.

g. The impact test would be made as well as the standard crushing test.

In all the above tests they did feel it reasonable to expect that aluminum would do at least half as well as the results on copper. Up to this point their limited investigation indicates that aluminum is roughly about ⅓ that of copper with regard to flexibility. Out test results confirm this also.

[fol. 5565] Conclusions:

1. Samples of aluminum conductor SPT-1 cord have been produced with a limited amount of success. It is believed that considerable improvement can be made but that EC grade aluminum will always be a problem from the standpoint of conductor breakage at the insulator. Breakage is no problem with copper conductor.

2. Performance tests show aluminum conductor cord relatively poor in comparison to copper. Improvement in this respect will be necessary before consideration can be given to submitting to the Underwriters.

3. The preliminary cost data indicates that it would be possible to produce the aluminum conductor cord at equal or lower cost as compared to copper conductor. This, of course, would depend on how successful we might be in overcoming strand breakage as production loss from this cause is not reflected in the costs shown here.

G. L. McCutchan.

GLM:hh

[fol. 5566] To: G. L. McCutchan

Could we incorporate reinforced strand to meet U/L tests? Maybe one (or few) strand(s) of stainless or alumoweld would do the trick.

News Release

For Further Information: Laurence S. Sewell, Jr.,
ATlantic 1-4545, Ext. 2861

For Release Friday, January 20, 1961,
Or Anytime Thereafter

East Los Angeles, Calif., January 20, 1961—Expansion to meet the growing and complex needs of the missile, rocket, and electronic instrumentation fields was announced today by the Rome Cable Division of Aluminum Company of America.

A. D. R. Fraser, Rome Cable president, said that the division has established new electrical cable production facilities, geared to these "markets of tomorrow," in a new plant here.

Called the Special Products Facility, the new production unit is now in operation. Its task, Mr. Fraser said, is custom fabrication of cables and cable assemblies, to customer specification, utilizing the full capabilities of Rome Cable.

Specialized equipment of the new unit permits a wide range of complex and highly specialized electrical cables and assemblies. Among its capabilities: single cables measuring up to four inches in diameter; cables consisting of as many as 330 separate conductors; incorporation of special connecting devices reliable under severe environmental conditions; and unusual configurations of cable, suitable for the rigid requirements of space craft and ground support equipment.

[fol. 5568] As a part of the Rome operation, the new plant offers particular advantages to its market. A coordinated

source of supply, it provides complete responsibility and quality control from raw material to finished product.

The new Special Products Facility is located in a new building in the east Los Angeles area, which also houses Rome's regional warehouse. The location places the plant close to Southern California's high concentration of aircraft, missile, and electronic industry centers.

Mr. Robert D. Golly has been assigned as general manager of the new facility.

Item 10- 30,000 ft. - 500 MCM - 37 strand copper - Ditto, O.D. 1.03", weight is 1648 lbs. M ft. @ - - - - - - - - -55.07¢ per lb.

All prices are list and include the following distributor's commission:

All 15 KV items - 2-1/2%

Copper Weatherproof items - 3/4¢ per lb.

Aluminum Weatherproof items - 3%

TERMS: ½ of 1% on the High Voltage items and Copper Line Wire items.
Net 30 days on the Aluminum Line Wire items.

In accordance with their instructions, the following information is to be submitted with the bid:

1. Paragraph 2.7 lists Dow Compound #Q4205.3. We believe this to be H.M. polyethylene and not a PVC material as indicated in this paragraph.

2. In regard to paragraph I.1A. On material that is to be supported by a messenger, etc. and where there will not be any in-Tension splices, the use of ECH-26 Aluminum has been found by many industry standards to be suitable. Where in-Tension splices might be encountered, ECH-19 Aluminum has been found to be more suitable. The ECH-26 temper offers a little more flexibility and ease of handling when installing, splicing, etc. over the ECH-19 temper.

These cables can be manufactured with either temper. For line wire, we recommend ECH-19 temper. For the Power Cable to be supported by a messenger, we feel the ECH-26 temper to be better suited from a standpoint of easier handling in the field, etc.

3. Current Carrying Capacities - 15 KV Cables based on 40° ambient temp.
(a) 1000 MCM Alum. - 630 Amps.
(b) 700 MCM Copper - 635 "
(c) 700 MCM Alum. - 520 "
(d) 500 MCM Copper - 530 "
(e) 500 MCM Alum. - 400 "
(f) 350 MCM Copper - 425 "

4. Diameters - 15 KV Power Cables
(a) 1000 MCM Alum. - 2.02"
(b) 700 MCM Copper - 1.83"
(c) 700 MCM Alum - 1.83"
(d) 500 MCM Copper - 1.65"
(e) 500 MCM Alum. - 1.65"
(f) 350 MCM Copper - 1.46"

Re: Rome Cable Corporation

Attached is a copy of a letter from Mr. Dwight Thayer, Sales Manager of Rome Cable Corporation. As you know, the Rome people have been very cooperative in suggesting names of their own distributors who are interested in Alcoa conduit. We realize that it is not possible to either contact or sign up all of these distributors immediately, nor in some cases is it practical to do so. Assuring that the merger with Rome will be consummated later this week, we believe that our best interests may be served by having as many of the present Rome distributors on our team as possible. This will enable us rather quickly to offer the same package now offered by Kaiser, a combination of aluminum insulated conductors and aluminum conduit.

Please use the information in this letter for what you think it may be worth.

Dixon Lewis.

[fol. 5588]

Rome Cable
Corporation
Rome, N. Y.

March 20, 1959.

Dwight Thayer
Sales Manager

Mr. Dixon Lewis,
Aluminum Company of America,
1501 Alcoa Building,
Pittsburgh, Pennsylvania

Dear Dixon:

I understand from our St. Paul office that Bill Knapp has made the necessary arrangements with H. and C. Electric, Mankato, Minn. for a consignment of aluminum conduit. I appreciate very much your cooperation in this matter and hope that your Minneapolis office found it possible to contact that list of other wire and cable distributors of ours which I gave to you.

Reports coming to me indicate that the Kaiser pressure is growing stronger as far as distributors are concerned and more and more distributors are becoming interested in aluminum conduit. It is our strong desire to call these names to your attention so that our distributors may be in position to compete with the growing trend toward aluminum conduit and in order that Alcoa may get the business rather than Kaiser.

General Electric Supply Company, Indianapolis, is a particularly good distributor as far as we are concerned and I understand from Stewart Johnston, our Chicago manager, that your local people have now agreed to take care of this house with the consignment of aluminum conduit.

There are other good wire and cable distributors of ours in our Chicago territory and here again we dislike very much to see distributors who have been doing a good job for us on wire and cable and have a consignment of wire and cable from us, ending up with a consignment of Kaiser aluminum conduit. I cannot help feel that in the long run it would be much to Alcoa's advantage to have these accounts. The names I have in mind are—General Electric

Supply Company—Fort Wayne, Indiana; Ralph David, Inc., Logansport, Indiana; Danville Electric Supply Company, Danville, Illinois; B. L. Robinson and Co., Burlington, Iowa.

[fol. 5589] I believe our Chicago man has had some contact with your Chicago people with regard to this matter but feels that he has not created much interest on their part.

It is my sincere hope that you can initiate some action toward the end of taking care of those names I have listed. Any contact with our Chicago office should be addressed to Mr. Stewart Johnston or in his absence Mr. T. C. Spriggs.

I shall appreciate very much your consideration of the above.

Sincerely, Dwight Thayer, Sales Manager.

[fol. 5590] In United States District Court

Plaintiff's Exhibit 287

To: Los Angeles
San Francisco
Portland
Seattle
Salt Lake
Denver
Los Angeles—Arizona
From R. E. Gates—Torrance
Date: May 8, 1959
Subject: Aluminum Rigid Conduit

Supplementing Dwight's letter of April 29th, we are happy to report that the second increment of our initial Aluminum tubing order placed on Vernon works has been received at Torrance. The third increment which will give us a full range of sizes ½" through 5" inclusive is scheduled for delivey at Torrance Monday, May 11th. We believe that we will be able to start shipping against your aluminum conduit orders May 18th. Beginning on the same date, we will be able to fill your order requirements for aluminum

couplings but it appears that we are 4 to 8 weeks from fulfillment of standard 90° aluminum elbow requirements. We do not at present know the answer with regard to filling requirements for special radius aluminum elbows. You will be advised.

The prototype order quantities suggested in Dwight's letter was based on experience to date but was arrived at prior to the reduction in price initiated by Kaiser Aluminum and effective April 27th. We believe under the present price differential tht you will find demand more closely parallels standard mix for steel conduit. Keeping in mind the fact that there are some prohibitions by local code authorities against the use of aluminum in some places where steel is accepted plus the fact that distributors may tend to over-order on a consignment basis, we would suggest that you discuss carefully with your distributor his initial consignment order.

The aluminum industry has adopted standard packaging for aluminum conduit and fittings which differ from our standard packaging for steel. In the interest of time we plan to ship aluminum conduit and fittings in the same standard package as you and your customers are used to for steel. In addition to the time element, we see no reason to suggest that the distributor order 50 each ½" and ¾" aluminum elbows to complement 1500 feet and 2500 feet respectively of ½" and ¾" aluminum conduit. I estimate the ratio of steel elbows per 10' length of steel conduit used is approximately one to 100 of ½" and ¾", seven to 100 of 1" and twelve to 100 of 1¼" and larger. I am sure your distributors are aware of this. Due to the ease of bending of 1" aluminum and smaller, we doubt that aluminum elbow demand will equal that shown above.

You are in a unique position—you offer your distirbutor the only source of all his conduit needs for shipment at one time from one place. If you have any questions please advise.

PLAINTIFF'S EXHIBIT 288

To: G. E. Rolston, Jr.—Philadelphia
From: R. E. Gates—Torrance
Date: May 8, 1959
Subject: Atlantic Refining Company—Rigid Conduit

Dear Glenn:

Many thanks for your report of Rigid Conduit tests being conducted by Atlantic Refining Company. Glenn Koger and the boys were mighty happy to learn that our product is noticeably superior. We hope that the final report will find us in the same relative position.

I gather that Aluminum proved superior to not only all other steel conduit but also ours. Since you can now sell Aluminum Conduit, you won't have to worry about us.

Many thanks, again, and we look forward with interest to your report of Atlantic's final evaluation.

Very truly yours, R.E.G.

cc: D. H. Thayer—Rome
P. J. Lopushinsky—Rome

May 20, 1959.

Stewart Johnston—Chicago
R. R. Davis—Kansas City
Dutton Lainson Co.—Hastings, Nebraska

Dear Stewart:

Attached is my consignment request for them covering aluminum conductor products and aluminum rigid conduit. I have used the aluminum rigid to get their aluminum conductor business.

The figures at first glance might seem to be incongruous but I want to point out that up to this month we have only sold them cartoned bare and W/P. If you look over their

incoming orders for this month I think you will agree that the Triplex has been pretty good.

Actually when I ask Mr. Phillips to give me some sales figures for aluminum conductor he wrote and told me that in the past 90 days they have sold 13,482.22 worth of ACSR and 7,023.61 worth of drop cable. I have cut this in half.

He mentions that they also stock Triplex at North Platte and intimates that he wants a consignment there. I am going to try to stall him until we get a pattern with the Hastings house.

I am particularly glad to tie up with these people because of the way they work. They want to do a good job for every supplier so they try to hold the number of suppliers down. I think this will be a good account.

Yours very truly, ——, ——.

Re: Sales Organization for the Handling of ALCOA Aluminum and Steel Conduit

A few days ago, Mr. R. B. McKee, in a confidential letter to all District Managers and Officers of the Company, advised that preliminary steps had been taken to transfer the entire responsibility for the sale of all Alcoa aluminum conduit to Rome Cable Corporation. The following reasons for this move, we believe, will be quite obvious.

Rome Cable Corporation has had not only several years experience in the conduit field, but also many years of experience in the associated field of the insulated conductors that are so frequently carried in conduit—building wire, power and control cables, etc., Rome also has a broad distribution through probably twice the number of distributors that Alcoa has and also operates ten warehouses of its own. All of you, of course, know that conduit is sold entirely through distributors. Also bear in mind that Rome is the principal steel conduit factor in the eleven western states. Its superior quality steel conduit, EMT, and steel tubing, and very recently, aluminum conduit on a toll basis for Alcoa, are all manufactured in its plant at Torrance, California.

Mr. Dixon Lewis will be responsible for the sale of both aluminum and steel conduit and will report directly to Mr. Glenn Rolston, Vice President and Manager of Marketing, Rome Cable Corporation. Mr. Lewis will assume these duties immediately, and accordingly you may expect to hear from him promptly regarding any new policies or changes in policy he may wish to institute in connection with conduit distribution and sales.

[fol. 5594] Since Mr. Lewis has been responsible not only for the sale of aluminum conduit but also for the activities of consigned stock distributors and agents while he was attached to my office, it will, of course, become necessary to have the distributor-agency activities placed under the guidance of someone else. Until this matter has been satisfactorily resolved, Mr. Lewis will carry on in a dual capacity wherein he will coordinate Alcoa's distribution policies with those of Rome.

We realize that several of you at least have already heard something of these organization changes as well as rumors of others; we shall try to keep you posted as further developments transpire.

Philip T. Coffin.

News Release

For Further Information: Laurence S. Sewell, Jr.
ATlantic 1-4545, Ext. 467

For Release Tuesday, June 16, 1959, Or Anytime Thereafter

Pittsburgh, Pa., June 16, 1959—Aluminum Company of America today announced that responsibility for sales of all Alcoa aluminum conduit now is being transferred to Rome Cable Corporation, which recently became an Alcoa subsidiary.

Addition of the Alcoa line to that of the Rome, N.Y., firm will make available to the electrical industry a full line of aluminum and copper conductors and accessories and aluminum and steel conduit from a single nationally known supplier.

Dixon Lewis, Alcoa's assistant manager of electrical conductor sales since 1953, has been named product manager of conduit for Rome Cable, according to Glenn Rolston, vice president and manager of marketing for Rome. Mr. Lewis will be on Mr. Rolston's staff, but will continue to be based at Alcoa's home offices in Pittsburgh.

[fol. 5596] "The new combination of Alcoa and Rome Cable technical experience in the field of conduit and conductors, plus the joining of research, manufacturing, and sales and distribution facilities, should prove a major asset to the growing electrical industry," Mr. Rolston said.

Mr. Lewis joined Alcoa following his graduation as an electrical engineer from Cornell University in 1927. He has served the company continuously in the conductor sales field since that time, in Detroit, St. Louis, Washington, D.C., and Pittsburgh.

Re: Sales Office Information Bulletin No. 78
Sale of Aluminum Conduit By Rome Cable Corporation

The entire responsibility for the sale of all Alcoa aluminum conduit will be transferred to Rome Cable Corporation, a wholly owned subsidiary of Alcoa. Rome's past sales activity has been in the steel conduit field and the insulated conductors that are frequently carried in conduit. This product is sold through distributors and jobbers and Rome has a broader distribution through this means than Alcoa. This means, any sale of aluminum conduit will be handled through the Rome Sales Organization. Rome will establish their own distributors and jobbers as outlets for aluminum conduit; therefore, those distributors and jobbers now established as Alcoa's will either be converted to Rome Cable Distributors or the distributor agreement will be discontinued.

Aluminum conduit will be manufactured by Alcoa at two locations; Alcoa's Lafayette Works and on a toll basis at Rome's Torrance, California, Works. It is the present plan that aluminum conduit will be supplied from the stocks at these two locations. Rome's Torrance Works will supply from their stocks the eleven Western states (Washington, Oregon, California, Idaho, Nevada, Arizona, Montana, Wyoming, Utah, Colorado and New Mexico). The aluminum conduit required for the remaining states will be fabricated and supplied from Alcoa's Lafayette Works.

The sale of aluminum conduit to the eleven Western states mentioned above will only involve Alcoa's Los Angeles Sales Office. The individual sales made through the Rome Sales Organization and shipped from the Tor-

rance Plant will go directly from the Rome Sales Organization to Rome's Torrance Plant. It will be necessary to transfer the toll production of aluminum conduit from Rome's Torrance Works to Alcoa consigned stock. To accomplish this Rome will issue an "Advance Order" to cover a month's production to Alcoa's Los Angeles Sales Office who in turn will issue a consignment order for this production.

[fol. 5598] The sale of aluminum conduit for the remaining states will be shipped from our Lafayette Plant. Such sales requirements will be channeled into Alcoa's Sales Offices through Rome's Sales Offices and will be processed in the following manner:

Order entry

1. Orders for aluminum conduit will be received from Rome Cable Corporation for shipment to Rome Cable's customers. Rome Cable Sales Office will forward a copy of their Advance Sales Order (sample copy attached) to the nearest Alcoa Sales Office for entry. This sales order will have all of the information necessary to enter an Alcoa Sales Order for the aluminum conduit specified. The Alcoa sales office is to ignore the "Sold To" name shown on the sales order since all "Invoice To's" will be Rome Cable Corporation, Agent, Rome, New York. The "Ship To" address will be the same on both the Rome sales order and the Alcoa sales order. The customer's order number shown on Rome Cable's sales order is their Customer's purchase order number and this number should be shown on the Alcoa sales order form under "Customer's Purchase Order Number". It will *also* be necessary to show Rome Cable's Purchase Order Number, which is shown on their form as "Our Order Number", on the Alcoa sales order under "Government Contract Number". It is necessary to follow this procedure to show both Rome Cable's Customer's Purchase Order Number and Rome's Purchase Order Number to provide both purchase order numbers as references on Package Tags, Shipment Manifest, Invoices, etc.

2. Alcoa sales orders will be allotted direct to Lafayette, Indiana, for conduit and New Kensington, Pennsylvania, for couplings and elbows.

3. The Sales Order Acknowledgment copy will be mailed to the Rome Cable Sales Office originating the Rome Cable Sales Order.

[fol. 5599] 4. Since Rome Cable Corporation is acting as an agent for Alcoa for the sale of aluminum conduit, the terms and price of the order should be "Consignment".

5. It is the present plan to use a separate Bill of Lading, Shipment Manifest, Shipment Notice and Package Tags for shipments of aluminum conduit and couplings. These documents will contain a combination name of Alcoa and Rome Cable Corporation. These forms are not available at this time but will be printed and distributed to the appropriate shipping points for their use. (Until these documents are received, a rubber stamp containing the name "Rome Cable Corporation" should be prepared by Lafayette and New Kensington Works of a sufficient size to be conspicuous. This rubber stamp should be placed on the documents mentioned above in the same approximate area as the name Alcoa or Aluminum Company of America appears.) It will be necessary for the sales offices to include an acknowledgment note on the Alcoa Sales Order as follows:

> "The Bill of Lading, Shipment Manifests, Shipment Notices, and Package Tags, will be supplied on special Rome-Alcoa forms."

Scheduling

Aluminum conduit is not sold directly to the ultimate user, therefore, all requirements will originate with Rome Cable's Distributors or Jobbers. The delivery of this product to the ultimate user is normally supplied from Rome's Distributor and Jobber stock, therefore, any item not in Rome Cable stock will require prompt shipment. Rome will enter sales orders for two purposes; one to supply their distributors with a stock of aluminum conduit and the other for their customer's immediate use. We are primarily concerned with those orders received requiring immediate delivery. It will be necessary for the Rome Sales Organization to clarify the urgency of those orders placed with Alcoa Sales Offices. These requirements can normally be broken into three categories: (1) Conduit re-

quired to meet a specific delivery requirement. This would [fol. 5600] normally be an immediate requirement which is not available from one of Rome Cable's Distributors or Jobbers. (2) Initial Distributor's stock. (3) Stock replacement. Rome's Sales Offices will supply this information on their sales order in the "When Required" block. When necessary Rome Cable's requirements should be expedited through Production Planning in the same manner as you would expedite any order requiring rush delivery. Other than the immediate requirement, the orders should be entered in the current schedule for this product.

Notice of Shipment

Shipment of aluminum conduit from the Lafayette Works will be included on the Daily Shipment List, the same as any other Alcoa Sales Orders. This information should be supplied to Rome's Sales Offices immediately upon receipt. If a regular Shipment Notice is required, it will be specified in the same manner as any other Alcoa Sales Order. The important thing is to keep Rome posted as to the current shipping information to enable them to service their customers.

Invoices

Rome Cable Corporation is acting as Alcoa's agent in the sale of aluminum conduit; therefore, consignment invoices will be issued to Rome Cable Corporation, Rome, New York, on each shipment from Alcoa's Lafayette and New Kensington Works. In the case of the Vernon Works, they will receive a monthly sales order from the Los Angeles Sales Office based on Rome's Torrance Works production and will issue a consignment invoice based upon the Los Angeles Sales Order. It is necessary to invoice all of the aluminum conduit to Rome Cable Corporation for the purpose of bookkeeping the consigned stock regardless of the "Ship To" address.

We are listing below Rome Cable Sales Offices that will be entering orders for aluminum conduit. These offices are listed in two categories: (1) Those offices supplying the [fol. 5601] eastern states and (2) those offices supplying the eleven western states.

October 1958	3,580,000			63,000
November " (Est.)	3,104,000			42,000
December " (Est.)	3,291,000			38,000
Total Third Quar. (Est.)	9,975,000			143,000
Total Nine Mos(Est)	$ 27,988,534			$ 254,836

[fol. 5605]

ROME CABLE CORPORATION

Earnings for the second fiscal quarter were better than the estimate at our September meeting. Estimates for the current quarter indicate a 5 per cent increase in sales and projected earnings of $143,000, or 25 cents a share.

SALES AND ORDERS

The breakdown of sales comparison of the first eight months of 1958 with the same period in 1957 by product class is listed below:

	April-November* 1958	April-November 1957	% Increase or (Decrease)
Rods	$ 3,210,000	$ 3,842,000	(16.5)
Bare	3,230,000	3,373,000	(4.2)
Weatherproof	755,000	1,073,000	(29.6)
Magnet	960,000	1,507,000	(36.3)
Rubber Covered	9,815,000	11,959,000	(17.9)
Aluminum	2,090,000	2,590,000	(19.3)
ROME PLANT TOTAL	$20,060,000	$ 24,344,000	(17.6)
Torrance-EMT & Industube	$ 2,540,000	$ 2,220,000	14.4
Rigid	2,520,000	3,223,000	(21.8)
TORRANCE TOTAL	$ 5,060,000	$ 5,443,000	(7.0)
COPE	$ 1,020,000	$ 1,463,000	(30.3)
TOTAL SALES	$26,140,000	$ 31,250,000	(16.4)

* Preliminary

October sales were the highest since August a year ago. Unfortunately, the steady improvement in billing volume which continued through October reversed in November and volume dropped back about 14 per cent below October, the poorest month since July. Incoming orders had shown steady increase for every month since last December but in mid-November noticeable declines appeared bringing total incoming back to March-April-May levels. December should show some improvement. The rapid rise and fall in the world copper market and year-end dressing up of balance sheets may have had some effect in this most recent reaction. We know it has also affected other companies in our industry.

[fol. 5606]

ROME CABLE CORPORATION

BACKLOG OF ORDERS

		Value
December 31, 1957	Rome -Copper Products	$ 1,895,000
	Aluminum	257,000
	Torrance-EMT & Industube	132,000
	Rigid	78,000
		$ 2,362,000
June 30, 1958	Rome - Copper Products	$ 1,575,000
	Aluminum	295,000
	Torrance -EMT & Industube	171,000
	Rigid	88,000
		$ 2,129,000
November 22, 1958	Rome -Copper Products	$ 1,988,000
	Aluminum	222,000
	Torrance -EMT & Industube	139,000
	Rigid	99,000
		$ 2,448,000

From the above you can see that most ordering is still on a near-term basis.

RAW MATERIALS.

Copper supply tightened in October and early November due to strikes and on October 23rd the price increased to 29 cents. World price went above 30 cents. World statistics for October showed a large drop in available stocks. In the last few days, however, custom smelter price dropped to 28-1/2 cents reflecting drying up of buying and settlement of strikes.

Aluminum and steel have been in ample supply. Rumors continued to circulate on a possible aluminum price increase early in January, estimated to be 1.3 cents per pound, which would restore the two cent drop initiated by Aluminium, Ltd. last summer. Since writing the above some aluminum producers have announced price protection for six months until July 1, 1959 which belies any such rumor.

Rome employment in late November is at the best level since about the same time a year ago but some shorter shifts will be necessary in December. Total number of salaried workers is down more than 10% from peak levels. In accordance with contract provisions Torrance hourly employees were granted a 7 cents per hour increase in October. Rome increase of 7 cents per hour becomes effective December 15. Salary increases of $13 per month were also made for both plants.

On October 1st we restored the salary cuts for all employees above $750 per month. The 5 per cent cut on those below $750 per month had been restored on August 1st. This total salary reduction saved almost $40,000 while in effect.

PRICES

In the early part of our fiscal year prices on many construction wires were at or near the lowest level since before World WarII, and have remained at lower levels for a more extended period than has been true in the same past period. The latest sheet of early November does recognize increased copper cost from the 25 cent low and a certain amount of price improvement on some competitive sizes, but still are far from satisfactory levels. Thirty per cent of the volume in October of these items were at the April price level with additional discounts. We still have some half million dollars of building wire jobs to be shipped in the balance of the fiscal year at these ruinous prices.

Because of competitive bidding on some Government jobs wherein two small competitors were shown to drop the price below published sheets, one of the producers cut bare and ACSR 1.3 cents per pound and insulated products another 10 per cent. This action alone will cost us an estimated $40,000 for the balance of the year. The practices of producers in slashing prices on fabricated products and taking their profit from volume of prime products is extremely vicious.

[fol. 3008]

ROME CABLE CORPORATION

ROME

There has been a steady improvement in volume at the Rome plant but for the first seven months of the fiscal year billings are almost 18 per cent behind a year ago. A portion of this is lower copper prices but a very sizable amount is lower selling prices. Prices on many construction wires in the first quarter of our fiscal year were as much as 40 per cent below that of a year ago. If October sales had been billed at current construction wire prices, results would have grossed $61,000 more.

Our enamelling equipment for rectangular magnet wire got into production in August and is getting excellent reception from our customers. The rapid growth of acceptance of this product is changing from glass and other types indicates the pressing need for one additional machine.

TORRANCE

Volume at Torrance has held up better than at either of the two other plants. Production of up to 4" conduit will get under way this month but will not be much of a factor in the current fiscal year. We have an agreement with Kraloy Company in Los Angeles to sell plastic conduit on a satisfactory basis. We are negotiating for finishing the production and sale of aluminum conduit with another Company in the Los Angeles area providing the pipe.

COPE DIVISION

Volume at Collegeville is down more than either of the two other plants. This has been due to additional manufacturers getting into the field and very low prices on sizable jobs. We are introducing a new product which is called "Controlway" without any elaborate tooling, which is estimated to add about 20 per cent to our trough sales next year. They have been working on an interesting Bus Box product which will probably take several months to perfect, design and tool. This has been developed by our Cope people working with our Engineering and Laboratory sections in Rome, and we have high hopes for its possibilities.

RESEARCH & ENGINEERING

We have actually introduced our new Spacer and have a small installation with Commonwealth Edison in Chicago. Great interest is being expressed in this product by utilities because of its lower net cost of installation, and also by many other companies in the industry. We have applied for a patent on this. We are currently working on a very sizable inquiry for Public Service & Gas of New Jersey.

More interest is being expressed also in our flame resistant polyethylene. This may have commercial possibilities of it being combined with the Spacer in high voltage cable.

[fol. 5609]

ROME CABLE CORPORATION

CAPITAL EXPENDITURES

Through October 31 we have expended approximately $800,000 of the $1,100,000 of capital expenditures approved for 1958. Of the total approvals $750,000 represented carryovers from 1957. On the unexpended balance approximately $40,000 will be carried over to 1959 fiscal year. Breakdown of the $1,100,000 is roughly - Rome $575,000, Torrance $500,000 and Cope $25,000. We have preliminary requests for 1959 exceeding one million dollars. In view of the current earning results I recommend total informal approval of $250,000. $140,000 Rome, $100,000 Torrance and $10,000 Cope. We need another enamel oven in Rome at an estimated cost of $80,000, and Torrance should decide on type of high frequency welding head and power supply to enable us to make aluminum tube. The cost of this unit is estimated at $65,000.

DIVIDEND

Consideration should be given at this meeting on payment of Common Stock Dividend payable in January.

PROFIT-SHARING AND EMPLOYEE DIVIDEND

In view of low earnings I recommend that we continue to make no payment to the Profit-Sharing Trust or Employee Dividend.

The Profit-Sharing Trust with J.P. Morgan & Co. Incorporated as Trustee had a book value of $164,986, and a market value of $191,700 as of December 1, 1958 and shows over 16 per cent appreciation. Estimated return was $7,188 or 4.40 per cent on book value.

ROME CABLE FOUNDATION, INC.

While it has been customary to take action on contribution to the Rome Cable Foundation, Inc. at this meeting we recommend no action at this time.

ORGANIZATION CHANGES

We are very happy that our friend of long standing, Mr. Albert D. Berning, former resident partner of Ernst & Ernst and now consultant for his firm, has agreed to work with us also as a consultant. His broad background and experience in industry generally, and his knowledge of our organization and problems should prove most helpful to us.

The position of Advertising Manager, which was open after the resignation of Paul Nelson, was filled by the appointment of Albert Dudreck his assistant. Doubts as to his being able to take over full charge were definitely removed by

[fol. 5610]

ROME CABLE CORPORATION

ORGANIZATION CHANGES - Cont'd

the fine manner in which he handled the department in the several months after Mr. Nelson's resignation.

GENERAL

I hope that the major portion of the meeting will be consumed in certain discussions on "Whither Goest Thou?" for the Company.

Respectfully submitted,

H. T. Dyett,
Chairman of the Board

March 21 and 22, 1952

General Program

Friday—March 21

8:00 A.M.—Leave Chapman-Park Hotel for Torrance plant
9:00 A.M.—Opening remarks
9:30 A.M.-12:00 N.—Plant visit
12:00 N.-1:15 P.M.—Luncheon at Chapman Park Hotel
1:15 P.M.-5:30 P.M.—Conduit sales session
6:30 P.M.—Dinner—Chapman-Park Hotel

Saturday—March 22

9:00 A.M.-12:00 N.—Wire and cable sales session
12:00 N.-1:15 P.M.—Luncheon Chapman-Park Hotel
1:15 P.M.-4:00 P.M.—Wire and cable sales session
4:00 P.M.—Adjournment

Agenda

Rome-EMT

Report by District Managers on order backlogs, current demand, future outlook and competitor activities.
Effect of industry split on price levels.
Need for continuation of rationing.
Prevalence of ratings, military and other.
Suggestions for stimulation of sales.
Present status TV mast business.
General construction picture—1950 vs. 1951 vs. 1952.
New size mix.
Zinc situation—allotments, etc.
Consigned stocks—necessity for.
Sales statistics—GESCO and WESCO.
[fol. 5614] Suggestions for improvement Torrance Sales Service.
Need for information competitor prices, quality, services and policies.

Suggestions as to literature both EMT and Rigid.
Caution re military specs.—Export packing, etc.
Comparison of sales by Districts—1950 vs. 1951.
Other items of topical interest.

Rome-RIGID

Discussion of Sendzimir process by R. A. Schatzel.
Desirability of sample kit and discussion of its contents.
Discussion of order backlog and mill condition.
Production increase forecast—G. Woodill—Status new heavy mill.
Military demand various districts—outstanding jobs obtained.
Discussion of competitive price situation various districts—possible need for limited freight absorption.
Necessity for 2½ to 4" sizes.
Demand, if any, (other than military) for black enameled and statement of our policy with respect to manufacture.
Attitude of N.P.A. toward ratings in Conduit Industry and their effect in getting steel allotments.
N.P.A. attitude toward jobber stocks.
Status of price levels and O.P.S.
Attitude of N.P.A. in matter of essentiality of steel electrical raceways.
Advertising plans rigid.
Other items of interest.

Rome Cable Corporation

Torrance Sales Conference

March 21 and 22, 1952

Friday Morning Session—March 21, 1952

Torrance Plant Visit

Upon arrival at the Torrance plant the group assembled for brief opening remarks by Messrs. G. E. Rolston and Gilbert Woodill.

Assignment of individuals to plant guides was made and the rest of the morning was spent in inspecting the Torrance plant facilities.

Friday Afternoon Session—March 21, 1952

General Sales Discussion—G. E. Rolston

In the way of introductory remarks Mr. Rolston expressed to the Torrance plant personnel the frank exchange of opinions characteristics of Rome Cable sales conferences and invited their participation in discussion.

Rome-RIGID

Mr. Rolston described the customer interest he had found on his trip down the West Coast in our production of rigid steel conduit and outlined briefly production problems encountered by the plant. In view of our present rigid conduit backlog and the need for prompt delivery, Mr. Rolston asked Mr. A.D.R. Fraser for a resume of the plant's production picture.

Mr. Fraser first stressed to the group the desirability of treating production data as confidential and went on to explain that a thorough study of the rigid conduit situation had been made at the plant and expressed the opinion that delivery of hot dip galvanized rigid conduit was some 60 days away, although alleviation of the situation had been found in the possibility of electrogalvanizing. It was estimated that with permission to electrogalvanize, shipment of ¾" could be effected within a week or ten days and 1" and ½" shortly thereafter. In the interest of customer

service the company will absorb freight differences where small shipments are considered necessary to satisfy the customer.

In the meanwhile progress is being made daily on the new hot dip galvanizing unit, the difficulties experienced being nothing more than those attending any new equipment project. Hope was expressed that the plant would be able to start shipping some hot dip galvanized rigid conduit before the end of April.

In the meantime, sales personnel were urged to get specifications changed from hot dip to electrogalvanizing wherever possible.

Mr. R. A. Schatzel presented explanation and discussion of the Sendzimir process of hot dip galvanizing steel pipe. In complimenting the Torrance plant personnel on the production job done to date, Mr. Schatzel outlined some known competitive practices in the manufacture of rigid conduit, all of which brought out the anticipated superiority and [fol. 5616] uniformity of Rome-RIGID quality. In explaining the Sendzimir process it was noted that uniformity and quality of zinc coating are all-important to the quality and workability of the finished product. Timing in the process of golvanizing is essential and comparison was drawn between Torrance's automatic operation and the haphazard methods of competition. It was pointed out by Mr. Schatzel that Rome Cable would be the first to use the Sendzimir process in the galvanizing of pipe and mentioned the success of Armco in applying the process to sheet steel over a period of some fourteen years.

Mr. A. A. Andersen supplemented the above remarks by pointing out that Rome Cable would be the first to manufacture rigid conduit by cold forming and electrowelding. He also laid stress on the merits of Torrance's shot-blasting process in that it avoids conventional pickling of the steel and has the effect of toughening the surface of the steel, therefore, enhancing ductility of the finished pipe.

Mr. Rolston urged sales personnel to be alert to city, county, or state regulations requiring submission of samples for approval. We should make an effort to get on as many approved lists as possible and have found ourselves ignorant of the sample submission requirement in instances in the past.

Mr. Rolston raised a question concerning the desirability or necessity of selling kits in the promotion of Rome-RIGID. Consensus of opinion indicated that a selling kit was desirable as a sales tool for our own personnel, as well as jobbers' salesmen in promoting Rome-RIGID business. Mr. D. H. Thayer solicited comment as to the nature and contents of such a sales kit and response indicated that it should not be too heavy and that it should contain samples of both Rome-RIGID and Rome-EMT, including test pieces as it was felt that the abuse these pieces show is one of our strongest selling points. It was felt also that the sales kit should include product literature pertaining to Rome-EMT and Rome-RIGID. Mr. Thayer will attempt to develop these suggestions into some more definite shape for further consideration.

Mr. O. I. Lewis outlined the general order backlog and mill condition on Rome-RIGID.

While as of March 21 we had on our books orders for 5,093,000' of Rome-RIGID, this only represented some 3,500 tons of pipe against an anticipated output of 1,800 tons per month.

Mr. Lewis presented statistics which indicated our profitable market for Rome-RIGID as being confined to seven western states. Figures further indicated that these seven states represent about 15% of the national sales potentiality. Further comparison indicated that to sell our expected plant capacity for Rome-RIGID we would need 41% of the potential total sales in the seven states to be served from Torrance. It was agreed that this picture called for the utmost in sales effort.

Mr. Rolston stressed the desirability of acquaintance with military and governmental purchasing offices at all levels, as well as complete knowledge of governmental specification details. We should be alert to unusual packaging re-
[fol. 5617] quirements or "catch" clauses which might increase our costs. Mr. Lewis reviewed current military orders on our books and indicated going price levels. Mr. Rolston defined this military business as looking attractive and Mr. Fraser urged a continuing flow of competitive and trade information to Rome.

In discussing the competitive price situation Mr. Lewis presented a map which, based on comparative freight rates,

indicated our profitable Rome-RIGID market to be pretty much confined to the seven western states. Our F.O.B. Torrance price sheet shows a price disadvantage of some $.50 to $1.00 per cwt. in the Mountain states. The Plains states, including a greater part of Texas, plus southeastern U.S., show a price disadvantage in excess of $1.00 per cwt. These figures would seem to pretty well define our Rome-RIGID market and eliminate the possibility of stocking and selling it out of our present Dallas, St. Paul and Chicago warehouses.

In concluding discussion of rigid conduit, Mr. Rolston asked for opinions regarding the necessity of Rome-RIGID in sizes bigger than 2". Opinions expressed indicated the need for conduit sizes up to 4", it being felt that lack of the complete range would in some instances cause us loss of business. There seemed to be no unanimity in opinion as to the demand for these heavier sizes percentage-wise. Those present were urged to try to get some figures indicative of this demand so that the seriousness of the problem might be better evaluated. Mr. Rolston advised the group that this matter would receive consideration as long as it was considered to be a sales obstacle.

Rome-EMT

Primary discussion evolved around the decided falling off of customer demand for electrical metallic tubing. Plant stocks have increased rapidly and the product is backing up in our warehouses, as well as wholesalers' inventories. There has been some evidence of price cutting.

Mr. Rolston related his visits with customers down the entire length of the Pacific Coast in which he found evidence of a slackening demand and posed the question for group discussion. In the roll call discussion which followed, reasons for the falling market were expressed as:

Shortage of copper wire to go in the conduit
Dumping of inventories from one territory to another
N.P.A. denial of building approvals
The unusually severe weather of western states

Regarding the outlook for the future, the consensus of opinion indicated an expected pick up in Rome-EMT business after a lull of possibly 60 to 90 days.

In discussing ways and means of stimulating Rome-EMT sales, opinion was expressed that TV mast business could have been improved if all sizes of EMT had been available. Opinion was expressed that the lack of 1½" had hurt this [fol. 5618] business in the Los Angeles area.

Mr. Woodill explained the unbalanced size availability as going back to the basic purchasing of steel. The correct gauge and width of steel has often times been unavailable and plant production has by necessity been predicated upon delivery of steel sheet and, therefore, often unbalanced as to size. However, this situation is improving and Mr. Woodill expected to be able to level out size discrepancies. Mr. Rolston pointed out that under today's competitive situation we must be more flexible as to conduit size.

Mr. Rolston pointed out our apparent misjudgment of the Rome-EMT elbow situation. Opinions as to what might be done to improve our sales varied but it was unanimously felt that both Rome-EMT and Rome-RIGID elbows were a necessary part of our line.

Mr. Rolston raised the question of the real need for black enameled rigid conduit. There seems to be very little need for it, based on the opinion that customers will take it only when they can get nothing else.

Priority Ratings

As they pertain to Rome-EMT and Rome-RIGID, Mr. Lewis expressed the opinion that priority ratings other than A through E now have little significance, except that in accordance with the basic priority setup a rated order does supersede an unrated order, production-wise. NPA's attitude toward jobber's stocks seems to be that they are necessary and proper. Mr. Lewis made reference to the Conduit Industry Committee's recent article on the essentiality of steel electrical raceways as part of a program to impress upon NPA the necessity of material allotment for conduit manufacture.

We have reprints of this article available and customer distribution of them was urged.

Consigned Stocks

In the discussion of this subject recognition was given to the necessity of consigning Rome-EMT in order to maintain

a competitive position. Requirement figures were collected from those sales districts involved for the purpose of seeking executive approval for the granting of consignments. Sales managers will be advised of authorizations as approved.

Until the availability of Rome-RIGID improves no authorization for consignment of this product will be granted.

Advertising

Mr. Thayer outlined briefly advertising plans as they pertained to both Rome-RIGID and Rome-EMT. The program has been given impetus by the taking of additional space [fol. 5619] in Electrical West and the immediate plan is to place emphasis on Rome-RIGID, thereafter combining or alternating the two conduit types.

The need of product literature was acknowledged and work will be started on the catalog section covering both Rome-RIGID and Rome-EMT.

Attention was called to the availability of Electrical Steel Raceways for customer distribution.

Question was raised regarding the effectiveness of direct mail effort and the general feeling seemed to be that it should be a part of our promotional effort.

Saturday Morning Session—March 22, 1952

General Sales Discussion—G. E. Rolston

Rome-EMT

As unfinished business, discussion took place regarding the market for Rome-EMT as TV masts. Opinions expressed brought out a number of differences in customer requirements depending upon geographical location, etc.

The market was recognized as one worth developing and Mr. Rolston urged that we attempt closer contact with the actual manufacturer of the masts, particularly where the business went through an electrical wholesaler. In other words, the business being non-electrical, we probably can save ourselves much grief by closer contact with the end use.

Commercial Tubing

This market was pointed out as being a sales possibility to which we should always be alert. Our Torrance facilities are suitable and it might well prove a production lifesaver in a time of slow electrical demand.

We cannot handle special alloys or stainless steel, but would like to receive all possible information on worthwhile business involving carbon steel tube.

Wire and Cable

The balance of Saturday's discussion was thrown open to Rome products without any formal agenda.

The first order of discussion, because of its present interest, pertained to aluminum conductors.

Mr. Rolston stated that on his trip down the coast he had seen considerable evidence of government pressure to substitute aluminum for copper. He quoted national statistics indicating the increased use of aluminum as an electrical conductor over a period of years.

[fol. 5620] Considerable confusion exists in government allocation of aluminum. Mr. Fraser reviewed some of the allocation problems as they have effected our own use of aluminum. Opinion was expressed that there would be more aluminum available for insulated conductors in the last half of 1952. Present availability, however, is tight and we have taken some orders in the hope of getting the necessary aluminum conductor. We may fall down on some of these and be subject to customer criticism due to circumstances out of our control.

Mr. Schatzel led a discussion of some of the uses of aluminum conductor. He related recent meetings of IPCEA and AIEE, both held in the attempt to find answers to some of the electrical problems, as well as to establish industry standards.

One big question remains to be the method of connections. As far as building wires are concerned there is no manufacturing problem, but rather a problem of our responsibility. There is still no satisfactory and proven method of connection. The compression type seems best, so far.

Mr. Schatzel stated that we feel aluminum conductors have a safe and permanent place in our picture; namely,

overhead as service drop or line wire and possible in building wires 1 AWG and larger where installation will be in the hands of trained personnel.

Industry efforts towards standardization currently involve establishment of standards for self-supporting service drop cable and the matching of conductor sizes of copper vs. aluminum, based on current carrying capacities.

Mr. Fraser referred to the recent agreement between Alcoa and Rome Cable. It is considered by us as an important "two-way street" in that we can get the benefit of their experience with aluminum conductors in exchange for our insulating knowledge. Mr. Rolston stated his expectation that the arrangement would lead to friendly competition of a high order. Sales personnel should make it a point to get acquainted with local Alcoa personnel. Difficulties will arise, a typical one being, inasmuch as aluminum is an allocated material, the possibility of Alcoa and ourselves quoting different delivery on the same job due to the fact that our allocation for a certain quarter may be all sold, whereas, they may have open availability. These situations will arise and will have to be worked out as they come up.

Mr. Rolston presented the aluminum price picture as being complicated due to the many variations and constructions. We are doing our best to get price sheets out in the field as quickly as possible. We will not issue a price sheet showing building wire smaller than 6 AWG and we prefer sizes 1 AWG and larger.

Mr. Schatzel explained the rather complicated number system used by Alcoa to indicate aluminum tempers. The Engineering Department will get out an information letter on this subject.

[fol. 5621] Moving from aluminum to copper discussion revolved around the pricing of power and control cables of the all rubber type, principally RoZone-RoPrene. Current pricing regulations for this type of cable cover a multitude of sizes and types. A real problem is involved in arriving at realistic prices. We have never been properly compensated for short runs. We have been following price regulations in this respect, with the result that some prices quoted have appeared out of line. We must, however, give these new short run charges a try until we find we cannot live with them and still be competitive.

Mr. Fraser expressed Rome Cable's determination to be competitive where competition is realistic.

Mr. Schatzel asked for competitive samples of rubber and Neoprene high voltage power cables (5 KV) from the field. Our costs on RoZone-RoPrene have been high. Competitive samples will indicate what our competitors are doing and may assist us in cost reductions. We recognize only Okonite and Kerite as being competitive to RoZone from the standpoint of quality. We do not want to lessen the quality of RoZone, but we must cut manufacturing costs.

Mr. Schatzel introduced the discussion of butyl vs. oil base compound and recognized the West Coast as being one place where competition has talked down oil base compounds in favor of butyl. While we may find ourselves coming to the wider use of butyl compound, we should in talking with customers make sure that comparisons between oil base and butyl are based on recognized industry tests . . . not trick ones. Oil base will still stand up favorably in comparison except, of course, for butyl's resistance to high temperatures.

Saturday Afternoon Session—March 22, 1952

General Sales Discussion—G. E. Rolston

This concluding session of the conference was devoted to analysis and review of the company's present overall order backlog. In other words, how realistic can we consider it?

The firmness of our backlog can materially effect both our short and long range picture from the standpoint of inventory, profitable production and serviceability to our customers. If there is copper now allocated in our backlog against worthless orders, we should determine that fact now and divert the copper to badly needed products, rather than waiting for cancellation and finding such diversion impossible. Discussion, therefore, was aimed at trying to find out "where we stand."

Comments and opinions were solicited from each sales district represented and while various explanations were made for apparent "soft" spots, the general consensus of

opinion seemed to be that the demand as reflected by our current backlog is real in most cases.

Mr. Fraser stated that responses to his recent questionnaire indicated our backlog to be 80 to 90% firm.

[fol. 5622] However, he urged that we examine closely our X-6 orders to be sure that we have the type of orders on our books that really mean something. Our large investment in outstanding reels was quoted by him as indicative of what we feel must be pyramiding inventories in the hands of customers.

The discussion was concluded with strong admonition by Mr. Rolston that we keep our ear to the ground with respect to our present backlog. We must be alert to any change or trend we see developing that may effect our backlog situation. Mr. Rolston recommended and requested that each salesman present set up his own personal system of keeping tabs on pushbacks and cancellations so that he may quickly sense any softening of the national market.

A plea was made by Messrs. Fraser and Rolston for continued competitive information of any kind. We have no desire to establish formal sales call records but Rome must be kept better informed of competition. The possible desirability of a simple multilith form for reporting competitive information was expressed and those present were urged not to withhold news of competitive practices just because they thought or assumed someone else would report the same information.

The afternoon session was concluded by adjournment at 4:00 P.M.

[fol. 5623] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 334

cc: D. H. Thayer, A. D. R. Fraser
To: G. E. Rolston
From: J. R. Woods
Date: May 5, 1959
Subject: Aluminum Sales Policies

Dear Glenn:

Ross asked me to outline some of the problems we have had or anticipate in the Alcoa affiliation. Naturally, my first desire is for a definite sales policy which will integrate the sales forces and take advantage of our combined efforts. I hope we can get some basic policies established in the near future so we can formulate effective sales plans. I believe we have a mutual understanding of these problems so I do not feel it necessary to elaborate on them.

The most pressing problem at the moment involves aluminum rigid conduit. We have made satisfactory arrangements to sell this product which will keep us from losing our distributors to Kaiser or Reynolds. The fact that both Rome and Alcoa are actively and independently soliciting customers, however, is bound to compound a problem we must face in the future. Our reputation, knowledge and establish relationships in the wholesaling field coupled with the broad line we can offer is going to make up a very desirable supplier, but a necessary part of our policy is in my opinion going to be selectivity. We will have a great deal to offer a wholesaler but this advantage will be substantially diluted if we offer it to a great many wholesalers. We are going to be faced with the problem of weeding out wholesalers and retaining only those that can do a good over-all job for us. Knowing this, it seems rather impractical for Alcoa to be adding conduit consignees that may have to be terminated if they do not fit into the overall picture. Terminating consigned stocks is at best a very messy job and in the process we might well do irreparable harm to our relationships with some wholesalers we might want in the future. The new aluminum conduit price and the possibility of a steel strike may well precipitate a de-

mand for conduit that would put aluminum in solid. We should be in a position to take advantage of these circumstances to establish and strengthen our position with good wholesalers, but this may be impossible to do because Alcoa's capacity will be spread around the country with consignees that we cannot build for the future with.

I will cite a case that illustrates the problem and I think points up the necessity of getting this matter settled immediately. As you know, we have never had good distribution in Maryland. The largest and by far the most desirable distributor covering this area is Tri-State Electrical Supply with a house in Hagerstown, Baltimore and Cumberland and branch houses in Chambersburg, Frederick, and Harrisburg. The ink was hardly dry on our affiliation agreement when I had a call from an old friend who is Executive Vice President of this company. He expressed interest in working with us and stated that he was going to concentrate on the thirty utilities and R.E.A.'s in his territory. He, therefore, was interested in the supplier [fol. 5624] that had a good reputation with the utilities, which we have, and, also, one who is a prime producer. He said we looked like the kind of a supplier with the kind of broad line he wanted. I stalled him off saying that we were going to be selective and that when we did enter into an agreement it would be on a partnership basis and that we would offer our broad line in return for preferential treatment. In other words, we would expect a good share of his regular business along with the overhead conductor he expected to get from the utilities. I also mentioned that aluminum conduit would be a very desirable part of our line, thinking I had a trump card to give him some food for thought. My plan was to bargain with him, our line including conduit for a substantial share of his over-all business. He called me back a few days later stating that he had signed up with Alcoa. He, also, expressed some concern over the fact that Alcoa recognized Line Material in Baltimore as a distributor and, also, that they had conduit consignment with some other small distributor in or near Baltimore. While I still have hopes of working out a deal with this customer, it is too bad that our hand has been weakened by dual effort. The sales advantages that Alcoa paid for cannot be realized if we continue to go our own

ways. We all realized that the affilition would cost both of us some business, but I fully expect that we will gain more than we lose. Unless we can come up with a coordinated sales effort the effect will all be on the negative side.

Very truly yours, Jr.

JRW:reh

[fol. 5625] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 348

J.H. Dyett

COPPER MEETING
April 20, 1939

PRESENT: J.H. Dyett, D.H. Thayer, G.W. Commerford, T.D. Bylin, J.S. Pendorf, F.S. Marks, Jr., R.G. Poole.

ABSENT: G.E. Rolston.

JHD mentioned that the copper market was weaker than it had been earlier in the month. The producers were selling at 11.5¢ and the custom smelters at 32¢. The metal is still in short supply.

In a discussion on INVENTORY JHD pointed out the 17% increase over a year ago in in-process stocks; the 20% decrease in consigned stocks; and the 14% increase in Rome finished stock. It was felt that the increase in Rome and a decrease in consignment showed a better disposition of finished goods.

The production in April is ahead of sales, with the exception of weatherproof. Some of this apparent overage in rubber covered is due to the late tabulation because of tab machine breakdowns. The total order backlog is down 900,000#, mostly reds.

JHD discussed the production and stocking of aluminum building wire at Rome and asked RGP to set up economic runs and inventory requirements. It appears that in order to meet competition, we are accepting orders, but will try to run economic lots. CHE stated that he did not feel the shipping room could stock any more than a very nominal amount of such wire without enlarging the present space. JHD said that as this program gets further along, we will have to analyze the possibility of such increase in space. It was not clear whether the sales department intends to stock at field levels.

There is expected to be approximately a 300-400,000# increase in rubber covered stock in April, and it was felt that our production should equal sales in May.

Through the 20th, transfers to rubber covered finished stock are 1,110,000#; ship out 946,000#; and transfers from bare wire to rubber covered 1,403,000#.

The following figures were given for May and June sales:

	May	June
COPPER		
Rods-Regular	1,460,000	2,000,000
-Toll	2,100,000	2,100,000
Bare Wire-Fab.	560,000	500,000
-Misc.	550,000	600,000
-Toll	85,000	100,000

[fol. 5626]

Copper Meeting
April 20, 1939

May and June sales(continued):

	May	June
Weatherproof	185,000	185,000
Magnet-Paper & Cotton	135,000	145,000
-Glass & Asbestos	60,000	60,000
-Forward	100,000	110,000

PRESENT: J. M. DIETZ, G. E. HOLSTON, C. H. ELLIS, T. D. STEIN, J. S. PENDORF, R. G. POOLE.

ABSENT: G. W. CONNERFORD

GER mentioned the competitive situation with respect to building wire and said that RCC was 15% above the industry up to the price change of 1/21/60. He reported that St. Paul Warehouse was virtually selling nothing and other warehouses were in similar positions. The new price level has placed us competitive or 5% above some companies, a situation with which we can live. Power cables have shown a further decline, selling 20 - 30% off the sheet.

JMD said that the order backlog was down 30% since January 1st, mostly due to not selling as great a volume of rods. R/C sales through the 12th billing day are only 60% of the budget. Magnet is off due to lack of orders.

In a discussion of finished stocks, JMD said that they were high in relation to the current and expected sales volume. Therefore, it would be well to reduce production of construction wire types until sales pick up. It was decided to produce approximately 200,000 lbs. less than the expected R/C sales in February.

The receipts of copper in February will be approximately 3,200,000 lbs. unless the strikes are over; in which case up to 4,500,000 lbs. may be received.

GER asked about aluminum building wire stocks. Schedules for TW and RHW braided wire have been started in the mill and sheets for RHD will be sent over by George Campbell as soon as estimated sales figures have been received from Dwight Thayer. (These were promised on January 25.) TDS was asked to rush these through as soon as possible.

Ordering amounts should be reduced on regular scheduled items by George Campbell (this was done on 1/25, with the exception of Reflex since we are still considerably backordered for most sizes). The sales figures now being used are about 10% lower than 1959 volume. A check with GER will be made the middle of February to determine whether the sales volume is changing from the estimated budget.

Magnet stocks should be kept up since GER stated that we would not get any orders unless we have stock. Customers can get immediate or 3 - 4 day delivery from competitors and will not wait for manufacturing time.

TDS asked whether this was true about Weatherproof. GER said he would review the situation and advise, but that using as a guide the last three months' sales would give the Production Department approximate figures for saturated and finished stocks.

[fol. 5628]

Copper Meeting - Jan. 22, 1960

Through the 21st the Rubber Covered transfers were:

Bare to R/C	1,100,000 lbs.
R/C to Finished Stock	996,000
Ship Out	714,000

The following sales figures were given for February:

COPPER

Rods - Regular		900,000 lbs.	300,000 at 36-1/4 300,000 at average cost Westinghouse - we will use 600,000 of scalped instead of 900,000.
- Toll		2,000,000	
Bare Wire - Feb.		260,000	
	Req.	550,000	
	Toll	235,000	
M/T		175,000	
Magnet -	Paper	125,000	
	Glass	10,000	
	Cotton	15,000	
	Formvar	125,000	
	Toll	31,000	
R/C		1,200,000	Production 1,000,000. Housing starts are expected to be off in 1960 - competitive situation
" -	Toll	25,000	

ALUMINUM

Rods	25,000
R/C	215,000
Toll	190,000
Bare	90,000

March is expected to be the same as February with the following exceptions:

Magnet		350,000
	- Toll	15,000
R/C		1,400,000
Rods Reg.		1,300,000

Internal Correspondence

From: R. R. Cope
Sales Development Division
New Kensington

To: Memorandum

Re: Edward Ashley Associates

Ref: Aluminum Insulated Power and Feeder Cable

We intend to ask the captioned to undertake an engineering study to determine the economic aspects of the use of insulated power cables in multi-story office building construction and in industrial plants. This memorandum is being written simply as a guide in making a proposal to the captioned for this work.

Mr. Rodee of Edward Ashely Associates indicated that they would be prepared to make a study for us and that they would use information which they have generated not only in our own plants but in other plants and office buildings which they have designed. We feel that aluminum should be designed on the basis of aluminum's characteristics and not on the basis of a preliminary design in copper and then a substitution for equivalent current carrying capacity.

1. Compare the costs of an aluminum system versus a copper system for multi-story office building construction using some typical building. This study should include comparisons of insulated power and feeder cables, vertical bus risers, and the branch circuit conductors used for lighting.
2. Make a cost analysis to compare aluminum versus copper in the construction of a typical industrial plant. Such a study should include a comparison of power and feeder cables, control wiring, and branch circuit wiring.

[fol. 5630] The fact that aluminum weights one-half the copper conductor for equivalent current carrying capacity, makes it posible to use aluminum conductors in self-supported spans from roof trusses without the need for large conduits. Also in industrial plants, cable troughs can be used to advantage eliminating the need for increasing the size conduit to accommodate the larger aluminum conductor. We are in hopes that this can be taken to account in their engineering study since it will be reflected in the installation costs. It is certainly our intention that the cost figures represent the installed cost of aluminum versus copper so that this information can be used to promote the sale of aluminum wiring with electrical contractors, other consulting engineers, architects, and electrical inspectors.

General Engineering and Research Survey

I think we are ready to start the Engineering Session, and I would like to add my greetings and pleasure at seeing you all again. I hope that we can make this Conference of real value to you. I hope particularly, that we will be able to give you some of the answers that you have come here to get. In order to do that I will limit the general remarks that I might make to just as few as I can, and get into the meat of our discussion. Distributed around the table is a list which I have headed "Topics". I don't expect to cover them all, but it is hoped by your interest in these topics, or others, that you will be able to guide us into the things you want to have covered.

First of all, before we enter this list, I would like to just mention something of our Organization and our changes, and some of our plans. Last year you know I told you that we were endeavoring to, and had perfected three organiza-

tions, of which I was primarily a coordinator. The Engineering Department under Mr. Graham as Chief Engineer, and you know how effectively he has been operating in that; he, together with Mark Wolf are running the Engineering Department. Of course in the Laboratory I don't need to tell you that Mr. McCutchan has been doing his usual good job, with a tremendously increasing number of problems.

During the year 1954, we set up a department under C. H. Ellis, a Technical Superintendent in which we transferred Austin Woolley. This was to permit a closer and more complete technical supervision of the day to day plant problems that arise in manufacture, all of which were carried out by the Laboratory. The Laboratory had a sporadic and a multiple type of authority; sometimes none, but at least the multiple responsiblity. This change, I think, places the responsibility, authority, and the command where it belongs and allows for improvement in manufacturing control. During this past year—Charlie may cover this—I think we have greatly strengthened that department. One of our students, Mark Dollard, and one of our previous students, Joseph Duffy, are there, both competent and capable engineers. We hope that department will be further strengthened.

"Now how does that tie in with the Laboratory? The Laboratory is able to devote its time on service, and can strengthen its service of development and research. We have made some steps this year in strengthening the Laboratory; not as much as Mac would like, but we've made a step in that direction. We have transferred from the Laboratory one of the most capable of our Engineers—one of our former students—Ian Marwick to strengthen the Electrical Section. We are strengthening the Insulating Section of the Laboratory, and during the year we hope that the functions of the Laboratory will be departmentalized into a group of specialists developing greater efficiency along these particular lines. I won't try to outline what I mean, expecting this—we have not just one Laboratory—we have an Electri-
[fol. 5632] cal Laboratory, we have an Insulations Laboratory dealing with plastics and complex chemical materials, including rubber. That's one group. We have a Metallurgical Laboratory, we have a Product Development and Testing Laboratory, and we have an Analytical and Control Laboratory, all of which are coordinated and directed under our

Research Director, Mr. McCutchan, and his Staff. Those, I think, are improvements in Organization that we have under way.

We believe we have greatly strengthened our Inspection Department. Starting last year we had an addition there in a testing group under Bill Griffith, who Mr. McCutchan had trained and who had been further trained in our experience in Spiral 4. All of our products that go through the mill today are sampled on regular schedule and tested, and we get weekly and monthly, a uniform report which gives us an idea of the quality level that we're running. We have a pretty good check on sampling tests because the Laboratory itself picks up some samples. In this way we are building up a history of quality.

Now we are trying to tie that in with another development taking place which we mentioned to you in industry, and that is the development of Statistical Quality Control, which we have put under Ken Hamlin. More and more Industry groups are interested in that, and we are trying to write it into specifications so that instead of asking for all of the certified test reports, and having to sample from each individual order, we are gradually getting acceptance of an idea in Industry, that they will accept a certified report that this product, made on a certain basis, conforms to a quality level experience of the plant. This does away with a great deal of this individual and expensive testing. We have that written in IPCEA; we have it written in some A.S.T.M. specifications. We have Quality Control committees in both those groups, and we are trying to tie in that customers will accept evidence of a quality level performance basis of the plant in lieu of specific tests on the order. That puts the plant that's doing a job on a little different basis than fly-by-night people who cannot, and will not, keep that type of a record. So I think that overall we are making some progress.

The Laboratory has aided tremendously in furnishing personnel, as you can see, for all of these efforts. In the meanwhile we have the responsibility to replace and strengthen that personnel.

During the year as you know, Gray Howe has been very sick. I haven't seen him as much as I'd like to, but I wrote him a note within the last few weeks and had a call from

him. I asked this, perhaps when some of you fellows were here, and you had an opportunity, he'd feel like seeing you and he said he would be very glad to. So I hope that any of you that might be up that way and could stop in, will do so. I know he'll be glad to see you.

One thing I want to mention which is very important is that Phil Isom has been carrying on as the active head of the Inspection Department. He has done a very fine job. He isn't here this morning, but I wanted all of you to know [fol. 5633] that Gray has a good man pinch-hitting for him.

I think that covers generally our changes in Organization, with one exception, that in our Quality Control group we have taken on a student who has a Quality Control background and he, we believe, will help strengthen that particular function. With the assistance of the plant, the Quality Control group have taken over the process control. We have process inspectors, and we have finish inspectors. Process inspectors were reporting to Production and they were responsible for quality levels too. All of that has been put under the Quality Control group, and at the request of our Production Department we are trying to extend that activity into as many departments as we can. I think we're making progress. I think a good deal of it is not alone responsible or not alone credited to the Quality Control group, but to Production and particularly to Frank Baumler who has been following it very closely.

In the field work during the past year we have tried to keep Bob home a little bit more, but I think you'll testify that he's been doing the usual good job and spending just about as much time in the field. So is Mark, but between them I think they have been here enough so that I could get away once in awhile.

Mike Kopchik has extended his activities to a greater extent, Field Engineering, and during the past year he was also our schoolmaster. He took care of our Students, as well as the Mining Cable with Dick Gray and Gil Lipscomb. He'll have something to say about that. We hope during the year that we can extend that work somewhat. I believe we are a little better organized, and I think some of you have also seen Ed. Duffy out in the field once in awhile. Unfortunately we still have complaints and Ed we have

here as a trouble-shooter, and in each case he has done a very fine job. Backing them up is Lew Selden to take care of the Underwriters' activities and some of our other NEMA activities, and Mert Williams of course, together with Sid. Mills. We also have in the Engineering Department one of our Students, Dick Coop, and he is holding down a regular job there now. I think we have our Engineering pretty well organized and you can look for at least as good service as in the past year.

I'm going to digress a minute from the sheets I sent out to you, and mention one thing that comes under the item of Bulletins. Last year we told you that we would endeavor to get a list of those Bulletins up to date with the obsolete ones so that you could simply organize your book and keep it current. We have that accomplished now, We also said last year that we would try this year to have something to say at this meeting on a new addition of the Manual. We have something to say but we don't have a new Manual. We just haven't had the manpower or personnel to do it, but we believe that during 1956 we can get a new Manual. We have a great deal to put in it. Our present Manual is in many ways obsolete. Of course, all our references to In-[fol. 5634] dustry Standards are today obsolete. Most of the data is good, but incomplete. We have to have a completely new section on Aluminum. We have to have a section on Splicing. We have a considerable number of new tables that should be included. All of that is going to take a tremendous amount of work, but we hope to have it completed in 1956 and ready in 1957 which will be the tenth anniversary of the first edition. That's the best I can tell you now.

Now I would like to take up this list of Topics, and I see I have pretty nearly run out of time. We will run over these topics and cover the ones that you have the most interest in. The first one I have is Aluminum, and I'll mention what I want to and then ask you to bring up any questions you want. Understand that Bob will cover some of the details on this. The reason I have put Aluminum at the head of that list is that I know you've already seen a tremendously increased interest in the field. I've talked to a number of Utility engineers. Bunky and I were talking to one last Tuesday, and he repeated what many of them have repeated

to me, and which was quite contrary to what I've heard before. It is not, Why should we use it", but "Why don't we use it?" "How can we use it?" And that is the changed attitude on the part of Utility Engineers.

A few years ago I told you that you can't change the elemental properties of a metal. Aluminum has one set of properties, copper has another, and all the bunk in the world can't change it. They have certain advantages and they still do. The properties of Aluminum are not changed at all, but the economics are, and in Engineering I think we have to recognize two sets of facts. One is the technical side, the other is the economic. When the economic pressure, the economic advantage, is great enough, I think we can find Engineering ways to do things. The Engineer in Industry and Utilities have reached that point. So you're going to see and already have, a tremendous interest and willingness to use Aluminum.

In Bare wire many groups are using bar*d* hard-drawn Aluminum transmission lines, replacing ACSR. That is done particularly in Southern California, it's done in Philadelphia, and it's done in many of your Utilities in the South, and it's done for several reasons. The primary one is economics and ease of handling and installation, and the reliability of it has been quite well proven. So I think we can see an extension of that.

You've heard quite a little bit about Aluminum Alloys; I think the Kaiser Alloy is the principal one. On that I only mention it to give you the reasons why we haven't been quite so interested. We may have to be, but we took this up with the Aluminum Company over two years ago. We also took this up at a meeting which we had all three aluminum companies present—Reynolds, Kaiser and Alcoa—this subject of why they couldn't provide us with an Alloy similar to that being used in Europe under the name of Aldrey in England; Similac in France.

[fol. 5635] There are several other metals, and they're all about the same thing. They are a Silicone-Aluminum Alloy having about 55% conductivity instead of 61%, and a tensile strength of about the same as hard-drawn copper, or a little higher.

Now the reason that we have not been so interested is first, it's difficult and costly to process. It needs a heat

treatment. The second thing is that used in the hard-drawn condition, it has what is known as a very low "notch resistance". Give it a scratch, and bend it, and a kind of fatigue starts which develops into a complete crack, right through the metal. Now, during the past year you've seen recognition of that. You have seen recognition of that in the fact that Kaiser has brought out their ND-1 Alloy and it's identical. I have not had it analyzed, but it's a Silicone Alloy, the same as has been used in Europe under the names Aldrey and Similac. Kaiser have not listed it in a solid conductor form, but supply it only in stranded; and the whole reason for that is to minimize in the hard-drawn form this cracking or notch extension when you get a scratch on it. If you have a scratch on one wire you lose one-seventh of your strength, not 100% as you would in a solid conductor.

Since this has come up we have taken it up again with Aluminum Company. In view of the fact that they have been slow in the development of their steel covered aluminum, and which they had discussed with us two year ago—we've taken up with them now that we've reached a point whether we should now consider an Aluminum Alloy, Aluminum Company and ourselves. If your development of this Aluminum covered steel is going to continue to be indefinite and slow, shouldn't we both supply this kind of an Alloy? We have back from the Aluminum Company an answer that as far as they are concerned, their opinion is the same as it was—that we could do it if we wanted to and they'll supply it, they make it. But our feeling is that we are not in position where we would want to take the responsibility in view of their technical advice. Now we can't knock another fellow's product and we're not so sure that some of these types of criticisms in the alloys can't be overcome. They have another reason which we think is more compelling than that. They say that this alloy which Kaiser is furnishing is too expensive; that while Kaiser is furnishing it they think their prices are altogether too low, that it will cost much more.

During this I've mentioned this Aluminum covered steel and you've heard of that as ACSW. ALCOA are still in a development stage, and I'm convinced they are. They have just ordered a press to be installed to make that material.

So whatever you hear about it now—Glenn or Fred has written you, and we've kept pretty close to it, and we know at Massena they do not have a press. We know that the press at New Kensington which they are making this on is not one built for that purpose. All the material is being made at New Kensington and sent to Massena for drawing, and so it is still a developmental material. We believe though, that eventually it will be a very worthwhile material once it's completely developed.

Now I'd like to go just for a minute to aluminum insulated conductors. I've listed here primarily building and power. The same problem exists as far as use in building wire as has in the past, and we've talked about it at your previous meetings. The problem primarily is connectors and the training of men that handle them. But we believe that aluminum building wire or aluminum wire for power uses, if confined to larger sizes, we prefer No. 1, but it may [fol. 5636] be that No. 4 or something like that would be agreeable. They are going to be used because the economic advantages are there and in those larger sizes the connectors have been developed; the service records are good, and we have the type of material that can be used.

We also know the types of things we'll run into and the types of faults we'll run into. What I would like to warn you about is power cables, either overhead or underground. As long as it fits the economic picture it is going to be used. It does fit the economic picture today, and this engineer in Philadelphia said if we get to using it we will find the bugs and correct them. That is a completely different attitude than the Utilities Engineer has had and it's true, we have always had that ability. There's one thing though that I would like to warn you of and you in turn, the people you are dealing with. We've had it come up here in two or three cases. We've had samples sent in from the field which we are very glad to get and which we had talked to you about before, and which we want to compliment you on now. We are getting samples from the field and these samples came in from competitors. I think it was a compliment to our Sales force that our Engineering friends gave them samples of competitive cable and said, "Here's some cable that isn't yours, but we bought it and we've had trouble with it, and it's aluminum—one case Service Entrance Cable. Other

cases have been weatherproof and if we bought your material, would it be any different? Is this something that could be corrected?" We have had to go back and tell them in each case it wouldn't make any difference who you bought it from, it's inherent in the aluminum. In each case, no matter how good the insulation is, whether it is Polyethylene, the best rubber we can make, whatever it is; if you get a hole in the insulation and it comes near the ground, you're not going to have just an out, you're going to lose your conductor. Now you don't do that with copper, but you do with aluminum; you have corrosion and you'll have it turned practically into a white aluminum powder. Now that's going to happen whether we make it or whether any of your competitors make it, and so we've got to advise anyone that comes to us with that kind of thing that it is a property of aluminum. That's a calculated risk you take in making and using it; and if we don't do that, if we supply them with some idea that we can make an insulation that will overcome conditions like that we are going to be in interminable trouble. We believe that Industry is willing to recognize its deficiencies and use them in spite of it and that's the position we're in.

I think on Aluminum Magnet wire we've had indications that it will be used in fixed equipment. Whether it will be used in rotating equipment or not, I don't know. Mark and Glenn will have to talk to you about that, because up to the present time vibration and fatigue have been too great a hazard to overcome in rotating equipment. So in a transformer, fine—in a motor—no. I have some question about [fol. 5637] that. I understand that General Electric had used quite a little of it in motors, and I understand that Ford is using it in starting motors. So any statement that's made without qualification, you could probably prove me a liar in ten minutes.

We're going to have more use of aluminum in flexibles. I put down the word flexible because we've had a considerable interest in certain welding cables and it won't stop there. Wherever a flexible cord is handled, where size is not important but weight may be, I believe we've got to begin to look at aluminum and that takes in quite a field. How far that will extend is going to depend again on con-

nectors, and there have not been any suitable connectors developed yet for that type of service.

We are working with a committee that will put into the Code new current-carrying capacities for aluminum. We have practical agreement on that now. Those were developed in IPCEA and I believe that very publication of that will give more impetus to the extension and use of aluminum. I have already mentioned the limitations.

Now can I stop for a minute, and ask if you've got any general questions on that subject?

HSW—Rudy, when you mentioned that you might get corrosion of the whole insulation and you might lose your cable, do you mean lose from corrosion only, or might get a short circuit? RAS—Well, it will be used, lost both ways, Skip—it can be lost completely from corrosion. We've had samples in here where the wire was completely intact; hadn't been burned, but with moisture entering and with just a slight urge, that that material was so bittle it could be just picked out of there. HSW—Rudy, what do you mean about a hole? Do you mean a hole in the insulation? RAS—I mean pinholes, or a damage in the insulation. Damage can occur during installation and can occur during service. It never occurs during manufacture. HSW—Is the rate of corrosion greater on all aluminum or ACSR about the same or what? RAS—Well, that depends on the cover. HSW—What I'm talking about is covered conductors. Well I mean covered ACSR. RAS—I should say it would be the same. The aluminum would react just the same as aluminum. HSW—Primarily electrolysis? RAS—Primarily electrolysis, that's right. But it's very susceptible. CRE—You spoke about connectors for Welding cable not being developed. RAS—That's right. They're not satisfactory and a great deal of work is being done. AKB—Rudy, are we regularly making aluminum Magnet wire? RAS—We have made flat Magnet wire and I think we'll take orders if they're big enough, won't we Glenn? GER—We're going to cover that. I'll cover the commercial part. RAS—So you'll get that answer.

Now, might I just hurriedly run down a few of these things, because I want to leave some time for the most important part of this program. That's the reverse lay Aerial cable. I only need to say that we have a license. We are

building a machine. Charlie has been very active on this, and I know I've had needles from you fellows during the year on when we're going to be able to supply. I think that it will take some time to get that machine built. Charlie might touch on that with you, but we're preparing to be in position to supply Aerial Cable, reverse lay. I think that [fol. 5638] you are also aware of the fact that Aerial Cable is getting more attention today than I think it's ever got from Utilities.

Butyl Rubber. I simply will admit now we've had a whole lot of trouble during the hear—a lot that we didn't anticipate. I think that is probably natural when you get into a material that is as tricky to handle as Butyl is, and to start real volume production on it. You find a lot of things that you didn't know, and that's our position now. We are working on them and I think when you go through the Laboratory Mac will have some samples out there. But rather than samples I think I can tell you that both the mill to the Technical Superintendent's department, Laboratory and the Mechanical Engineering Department are putting that on the top of their list. There are mechanical changes that have to be made in our equipment before we can satisfactorily process it. Those are being pushed just as fast as they can. I've listed here RHW because that's a Butyl problem. Someone wrote in and asked when we would have approval. We've had approval for months. But until we are satisfied that we can completely and satisfactorily process it, we have not spread that information or taken orders. We've taken one or two because we thought we needed that to develop our experience. That, I believe, is closer to solution than the high-voltage. The RHW is not far off, so we expect to have something for you shortly. On that again, it's a mechanical and processing problem.

High-voltage Butyl during the year has developed quite a lot, and our competitors have made some improvement. We told you last year that there was one competitor that had a good product, about the only one we would be satisfied to sell. That isn't quite true today. We've seen at least one other competitor that has improved their Butyl high-voltage insulation and we don't doubt that there are others. As a matter of fact, we have one of our own; that if we can

get satisfied that we can process it, we're quite satisfied to offer.

At the next AIEE meeting in Chicago which will be next month, there's going to be a tremendous pressure on this Butyl problem, and our RoZone and oil-base insulations generally are under attack. They're under quite serious attack, largely because of heat resistance. At the next AIEE meeting there will be three papers presented on Butyl and in each one of them oil-base insulation will be directly compared to Butyl and undoubtedly that will have repercussions throughout the year. Bob, at the expense of encroaching on your time a little bit, I'm going to just mention some things which we feel in regard to these particular papers and in regard to this type of attack which is perfectly justified if held within proper limits. We believe that the better method would be to go out and make a positive statement about Butyl, and leave out the question of competitive materials which are oil-base. Now our statement on that is this, that we're talking about high-voltage cable. Butyl rubber, as far as high temperature is concerned, there's no question about its being better than any other rubber that's been developed for high temperature. That cannot be questioned successfully until you go to Silastics. [fol. 5639] However, we're talking about high-voltage, transmission of electrical power at high voltage. The successful use of rubber as an insulation in transmission of power at the high voltages has been due entirely to oil-base insulations. It is the only material that has been used up to a few years ago, so all the experience, all the history of the electrical industry in the use of rubber, the high-voltage has been based on oil-base insulations. And as we've gone along through those years, that experience has been good. It has weeded out all competitive material.

Now we come to a new material developed and we present a great deal of Laboratory information of tests at high temperatures, etc., which show that the oil-base material which has been used successfully, is not good. Whether you've got a problem there, your must admit that tested at these high temperatures, which the other material will stand, it does not show up good. But this isn't the way that oil-base insulation has been used. It has been used and recommended at a lower range of temperatures, and when

properly used, has back of it a very satisfactory experience which Butyl does not have.

When you have a group of Laboratory tests which deny your experience over a period of years, what do you do? Throw out your experience, or question your Laboratory tests? Question your interpretation of the data? I think that most engineers, most sensible people, will go back and examine their interpretation of the data, and if they do, believe they will offer this conclusion—that the most reliable insulation for high voltages to use at 70 degress and lower is oil-base. If you have to engineer a job, if you have to make a decision on an application where a temperature higher than that must be used, you have every right to use Butyl. If you want to use the material within the range of 70°, you have a right there to do whatever you want to—you can use Butyl or oil-base. In one case you're going to place your credance on your Laboratory tests and in the other case on your experience. I think that is the only way that we can answer that type of thing, and that is the thinking that we have that guided us. So I give it to you for whatever it might be worth to you.

I'm going to mention one other item and that's TreePlex, because I believe that the others will probably be all touched on in our discussions later. TreePlex of course is our Polyethylene with Nylon sheath. At the time that we brought that out we believed, and still believe, that it was a very fine product, and fine development. We ran into two things with it that we have had to back off on. One is the extrusion of Nylon on large sized conductors. We're making Nylon you know, regularly on your Control cable. We supplied a great deal of it for Field Wire. It is the Standard of the United States and every other NATO country, and stored in all the world. Every company that makes Field Wire extrudes miles of it every day; we did. We extended in the Laboratory and under Laboratory control in the plant its use up to larger sizes. However, when we come to turn it over to regular production, even under Laboratory control, we could not satisfactorily process it. We've tried [fol. 5640] various types of mechanical improvement we could think of; we had every assistance from the Production Department that we could get off from everyone else, and it just didn't work. So we have to correct that part of it.

The next thing was that we had some disturbing evidence. The Signal Corps after all these years, used it during the war, ten years afterwards, standardized on it in every country, and had commissioned Battelle Memorial Institute to conduct an investigation on aging of Nylon. Battelle came out with a report that we believe today and so does duPont, that it is a very academic type of thing; but nevertheless it had a tremendous influence, in which they said that Nylon would age two years. Certainly for a wire covering we cannot rely on material that would age two years. The criteria of their judgment was, after aging under ultraviolet light for a certain number of hours, which was equivalent approximately to two years, it would crack when bent at minus 40°. Now for Tree wire we don't care whether it bends initially at —40°. Very few of the tree wires that were ever made have coverings that will withstand bending at —40°. However, the whole age-resistance of Nylon exposed to weather was under question.

We've attempted to clarify that with duPont, calling their attention to the wide use and the fact that they had investigated the material, and that they had publications out which mention excellent weather resistance. We called it to the attention of duPont, and we've had a series of letters from them. In one of these in answer to a letter I wrote them, I had a letter back on May 5th of this year which stated as follows: "A critical analysis was made by our Research Laboratories after a nine-year Florida exposure of Nylon containing Carbon Black. This particular data was based on an 11 mil Monofilament which showed a moderate dropping off in tensile strength and elongation in a few years, but then leveling off at the end of the nine years, still retaining 45% of the original tensile strength and elongation at —23°." They were good enough to tie a knot, etc. We asked them then to see the original research data, which they agreed we could do. I'll make this story very short now in saying that duPont have agreed and have been co-operating with Mr. McCutchan in actually coming into our plant in running Nylon; developing Nylon that will run, or helping us to correct whatever conditions we may have here to run it, *or helping us to correct whatever conditions we may have here to run it,* and at the same time, extend this research into aging, and to supply us with the original

data on which these statements of life is based. When we get all that tied together we will then make our decision of starting up on TreePlex again. So before we go out again we're going to have a good story on the aging as well as being able to process it.

In the meantime we have had other developments of improvements in Polyethylene itself, in which we feel that perhaps by the time we have this corrected we may not need it. We may have a Polyethylene insulation with much better abrasion resistance and requiring no outer covering. Now that's the story as it exists; I'll be glad to answer any ques- [fol. 5641] tions that you might have.

Now there's one subject I want to mention here. Many of you have written in about 5 KV unshielded cable. Bob has mentioned our report which we sent out. The report establishes things that we all knew, but puts down in very definite form the risk that we're taking. The Laboratory is still conducting investigations, a more complete investigation, which we hope will become a paper we can publish in the Industry and then have the Industry itself know, which I think some may not, but there is a calculated risk. We're taking that calculated risk when we're supplying unshielded 5 KV cable. Yet for 4160 whenever we know what the particular installation conditions are we may have to broaden that during the year, but we want to control it as much as we can. I don't know that we'll ever be able to change the picture because there are as this report and as our experience shows, a great many places where 5 KV unshielded cable is satisfactory, but during the year we hope to clarify that picture and certainly we're going to continue to meet competition. I think that in general, that covers everything.

HWS—Rudy, the August 8 issue of Electrical World had an advertisement by Okonite—if you haven't seen it, I've brought one with me—why Okolite conductor, etc. Can you elaborate on that a little bit? RAS—No. I think I can't, we have looked into that, Okoloy coating is a lead coating in the place of tin, and this is the general picture; with these oil-base compounds we do have compounds with a rather high sulphur content, and when we have moisture present, in the presence of moisture, with sulfur, we have sulfuris and sulphuric acid formed which will etch and destroy tin. It will do the same thing with lead, but slower. Now the part

of that is this—when you get water through an insulation and onto the conductor you've destroyed your insulation anyway, and so you just want to keep water out. So any time that you operate a cable with water on the conductor and insulation over it, you've got a cable that's going to fail no matter what the insulation is. So this is purely an academic question.

Electrical Conductor Division Newsletter

The aluminum weight of bare cable produced in January was greater than for any previous month since last August and was 10% above the weight for December of last year.

New orders for bare cable received in January showed an increase of 39% in aluminum weight over the previous month. Although the January total was considerably below

what we would have liked to receive, January was the best month since last September.

Orders for 100,000 pounds or more aluminum weight were as follows:

Customer	Aluminum Weight Pounds
Consumers Power Company	1,000,536
Graybar Electric Company	177,574
Indiana Power & Light Company	220,431
Pennsylvania Electric Company	200,634
Priester Supply Company	130,652
Savannah Electric & Power Company	175,923
Toledo Edison Company	101,134
Westinghouse Electric Supply Company	108,961

[fol. 5643] The aluminum weight of covered conductors for January was down when compared to December of last year. New orders were down 10%, bookings were off 15%, and shipments were down 19%. However, when compared with January of last year, bookings showed an increase of 140% and shipments, an increase of 30%.

Competition, like death and taxes, can never be avoided; but through the years it does change. Before World War II our conductor competition was with copper whereas today it is with other manufacturers of aluminum. To sell a transmission line years ago our peddlers, and we had some good ones, often were faced with a lower copper price per mile than the price for equivalent ACSR; and as a result they had to show that the cost per mile of completed line would be less with ACSR than with copper. They had to consider the cost of supports, hardware, and stringing as well as the cost of conductor. To prove that copper is a has-been for bare transmission lines, consider a 138 KV, 100 mile, three phase line on steel towers, using 556,500 cm ACSR 26/7 or 350,000 cm copper as the conductor. One of our tower designer friends tells us that based on a tension of 40% of the ultimate under heavy loading conditions the approximate average span for 556,500 cm ACSR would be 1000′ and for 350,000 copper, 750′. This would mean an average of 1.77 more towers per mile for the copper than for the ACSR resulting in an addition of 20 tons of steel per mile at $.15 per pound and $100.00 per ton for erection costs. It is assumed that stringing costs would be about the same for both conductors. The net result would be that the copper cable plus extras for steel costs, erection, and insulators

would total $1,646,577.80 as compared with $395,503.20 for the ACSR; the cost of copper cable alone would be 209.91% of the cost of ACSR.

[fol. 5644] We recently completed tests on compression dead ends, similar to the Cat. 900 series, on 5/16" and 3/8" stranded steel conductors, using both a Model B and a Model 12-A compressor for making the compressions. The same dies were used as are required for the Cat. 1070 series compression joints for these ground wire sizes.

At the time tests were made only one customer was involved; but if any of you peddlers know of anyone interested in these dead ends, test results, design information, and prices can be obtained from F. R. Dallye. If the demand justifies it, these dead ends will be shown in our catalog data at a later date. Incidentally, the efficiency of the dead ends was comparable to that of the compression joints.

At the recent sales meeting in Chicago several of you made inquiries about information required to evaluate a competitor's accessories and to design new ones of our own. Larry Flaugher has suggested the following procedure.

When you forward or inquire about a competitor's accessories, we can best assist you by knowing to what service the customer intends to put the accessory. Include with your inquiry the cable sizes involved, state which of our clamps will suffer if the customer starts using the competitive item, and tell what the customer can do with the new accessory that can't be done with one of our existing designs. To design new accessories, we would like to know (1) what accessory is needed, (2) what service is required of the accessory, (3) on what conductor sizes it should be used, (4) why none of our present accessories are satisfactory for the job, and (5) what competitor's accessories will work.

Please forward your information or sample accessories to F. R. Dallye.

[fol. 5645] One of our customers was recently caught between a rock and a hard place when trying to use dies for a figure eight-cable joint in an H compressor to compress tubular joints on Merlin. This combination has never worked in the past and will not in the future, but it was recommended by a "Service Engineer" not a Field Advisor. Perhaps the name "Service Engineer" rates above Field Advi-

sor, but at least our boys know their onions and would probably agree with the late Will Rogers that "Some people say eat that ain't et."

As soon as our present supply of cut thread U-bolt, used in our Cat. 280 series of parallel groove clamps, is exhausted and Lancaster can complete their tooling changes, rolled threads will be supplied. Rolled threads are superior to cut threads, and we want to use the best bolts available.

Until comparatively recent times very few, if any, transmission or distribution lines were strung under tension because equipment was not available to permit a good job to be done. Braking the cable reels so as to develop any real tension in the cable was not desirable and bull wheels around which to pass the cable were only used for special jobs such as difficult river crossings. Two or three contractors constructed some tensioning equipment to be used for stringing super-high voltage lines; but in general, lines were built the same way as in the past except that the cable was pulled out by cats or winches rather than by horses or mules.

Some of our customers are now stringing lines under tension using Pengo wire tension stringing machines and we have received reports that these machines do a good job. The November, 1955, issue of "Electrical West" contains an article "Greased ACSR Is Tension Strung" which describes the stringing of a 220 KV 1,033,500 cm ACSR line of Southern California Edison Company using the Pengo machine.

[fol. 5646] Sales for 1955 of electrical conductors and accessories from consigned stocks amounted to $4,121,600.00, a gratifying increase of 79% over 1954. Agency sales totalled $4,117,100.00, also up 81% over 1954. Graybar had 48 stock locations at the end of the year and turned in sales from consigned stocks of $1,527,900.00, agency sales of $2,064,400.00, the total being up a comfortable 69% over 1954. We now have 9 Gesco stock locations, with consigned stock sales of $349,900.00 and nationwide agency sales of $424,200.00, totalling up a whopping increase of 188% over 1954. Wesco still had only 3 stock locations at year-end, but in January came through with a new one for Win Dow in Burlington, Vermont. Wesco consigned stock sales in 1955 were only $69,900.00 but as agents the nationwide take was $495,-

100.00 for an overall increase of 47% over 1954. An annual turnover ratio of 3.7 for all consigned stock distributors set a mark that will be hard to beat.

In the national sweepstakes for individual honors, the irrepressible Mr. Beck's Priester Supply Company of Dallas again wins in a walkaway with consigned stock sales of $785,300.00 and agency sales of $98,700.00, up 58% over 1954. Tom Tate's Line Material Company at Miami was a good second, C. D. Blair's Stuart C. Irby Company of Jackson, Mississippi, third and Mr. Beck tries to monopolize the winner's circle by bringing in Nelson Electric Supply Company at Tulsa a comfortable fourth. With a few exceptions, all of our distributors and agents are to be congratulated for their fine 1955 showing in a highly competitive market.

Distributor training course nominations are again in order for groups starting from New York on April 8, May 6 and June 3. You send us some good men and we will send them back well-equipped to sell Alcoa products for you.

April 6, 1956.

F. S. Marks
Sales Manager

To Our Bare, Weatherproof and Magnet Customers:

For many months the prime copper market has been in a state of confusion. Instead of a single domestic price, to which we had been accustomed for years, producers and smelters prices have differed as much as 8 to 10¢ per pound

during this period. The foreign price has consistently been higher than our domestic market.

To meet our Country's needs for copper, the United States is dependent upon sizable tonnages from foreign sources. Since last August producers' prices have climbed from 36 to 46¢ per pound. We, as an independent fabricator, are only able to get a portion of our needs to meet your demands at producer prices. The rest, and it is a sizable proportion, has to be bought at premium prices.

Until March 20th our prices for sales of copper Bare, Weatherproof and Magnet Wire products were based on producer prices. On that date one of the large American producers of Chilean copper announced that their Chilean copper sold in the United States would be priced at London Metal Exchange prices. We have actually been buying copper in the last several months on eight different sets of terms and the American Metal Market in their editorial of April 3rd said ten different pricing methods are possible.

In an effort to get some recovery of our costs, we increased our base prices 3¢ a pound on March 20th. The effect of the Chilean contracts with Anaconda and Kennecott has brought the foreign price down approximately to the 50¢ level, but near term copper from other than producers is costing more than that figure.

Because of this downward price movement, effective today, we are reducing our base prices on copper Bare, Weatherproof and Magnet Wire to 47½¢ copper level, despite the fact that we feel there are still many variables in the method of buying copper.

We appreciate the many problems this changing market has presented to all of us and it is our hope that there will be less fluctuation and more stability in the future. We will do our best to continue to serve you with quality products at a fair price and we will try to keep you advised of significant changes in the market.

Yours very truly, Rome Cable Corporation,
F. S. Marks, Sales Manager.

PLAINTIFF'S EXHIBIT 355

Rome Cable Corporation

1957 Sales Conference

J. H. Dyett—Materials, Money . . . What They Mean to You

It's a pleasure to be talking to you on a subject that Dwight picked out, but last year he made me talk on "Confounding the Experts" which I found rather difficult. This year, as you will see from your program, it is "Materials, Money and What They Mean to You". Well, yesterday Ross said that this group owned one-third of the shares of the company. Well, that means that that subject means a great deal to most of you. Now if you have studied the Annual Reports you have seen that a year ago the materials cost 67½ cents of the sales dollar and in the year just passed by April you show 61½ cents. Now you can say, well materials don't cost as much anymore, but remember we have had increasing costs other places. Payrolls in the last four years have gone up 3 cents on the sales dollar and other services 2 cents, so we still have a very narrow spread when it comes down to the profit items. Even with the diversification which we have been attempting to get in Torrance and in Collegeville, we find that copper last year amounted to 42 cents of the sales dollar while steel was 5 cents, aluminum was slightly over 2 cents, Neoprene was nearly 2 cents and Polyethylene 1½ cents. So keep that 42 cents in mind. It is so important that we can spend a great deal of time in studying the situation. The copper cost 10 times as much as the final profit to the company and at the current rate of profit we are realizing in the Rome plant it would be about 20 times, so those are very impressive figures. If we buy less copper and sell the same amount of goods, meaning that we get better turnover, naturally we are going to show better profits and since you are interested in profits it shows that you can be of great help to us.

Now, where are our inventories of copper? Probably driving down you saw hundreds of wirebars and you think,

—Good Lord, Rome Cable is really stocking up on copper. Well all that copper belongs to other people. It is here on toll. At the present time we operate on no wirebars. In fact, sometimes we go into the red but we always have copper in transit so we can replace that copper. Some day we are going to get back to the situation where we are going to have to have a stock of wirebars. In the old days we felt as though we needed at least a week. We didn't have all the toll copper. Situations seems to come back to us so some day we will have to provide money for a wirebar inventory. We have in scrap both here and at the refinery about 7 per cent of our total inventory. That is lower than it usually is, so with different situations perhaps that percentage would raise. In process we have 33 per cent. In Rome finished stock we have approximately 20 per cent. Now, that is at practically an all-time high of about 2,700,000 lbs. That means we can give you men in the field better service at the present time than I think has been our history in the past. Now in warehouse and consigned we have been averaging recently about 40 per cent of our total stock. So you add that 40 per cent to the 20 per cent odd in finished stock in Rome and it goes to make up a total of nearly two-thirds of our total inventory in finished stock in order to serve you and your customers. That is by far the largest segment of our inventory and you have that, to a certain extent, under your control. Now several of you men have had discussions with Dick Poole and myself on the subject of consignments, and I don't think since we've had them there has ever been a time that we in Rome haven't crabbed about them. After the meeting a year ago in June we were very disturbed here because we seemed to get no place so at my recommendation we hired Ernst & Ernst to make a study of the situation. I will not go into the details of that, but it was at considerable cost to us—in fact the study cost more than we earned in the Rome plant in the month of July. So you can see we are not talking about pennies. The main thing that they brought out was that the responsibility for the size of the consigned stock has to rest in the field. Therefore, all you gentlemen are responsible for that. We thought we had set up certain tools which would help you. Well those tools were not tools that you wanted, because

they were not used by the ones which we had given them to. We did not feel that everyone needed them because in certain areas they were getting good turnover. As a matter of policy here in Rome—and I hope I am speaking for every-[fol. 5649]one here—we don't care whether you get your turnover by Ouija board. The only thing is that we want to insist upon is that you get that turnover and you realize how important it is. If we cannot get the turnover we may have to insist that you try to follow the Ernst & Ernst system, or we discontinue consignments. I don't think we can go merrily along on this subject the way we have in years past. For instance, you may say, "Why get all upset about the consigned inventories?". Well, they value on a market basis about $1,900,000; on book value about $1,400,000. Now keep those figures in mind when you think of the additional loan we took out in August. We took out $2,000,000 in additional funds, so a great percentage of that is invested in consigned stocks. And remember we took that out at an increase in interest rate. It is now 4¾ per cent, and we admit that is low in comparison with what some people are borrowing, but it still is something to conjure with. We continue to beg for your cooperation in this matter. We know it can be done because one territory year after year is able to get 4 times turnover, and I am sure in that territory they run into the same conditions of competition. Maybe one month it isn't as bad as maybe some other territory, but year in and year out they must face the same type of competition and we certainly have the same policy of selling there as we do in the other districts. If we can control this inventory situation it means we have dollars for other things. We have countless meetings in Rome trying to control inventories. But what has the total inventory picture been? In September of '55 we had $5,200,000 in inventory, in May '56 we had $7,800,000, on July 31st of this year we had $8,900,000. In other words, it's been up 70 percent. And I think we all will agree that sales haven't been quite as good as they were in those other prior periods. Now, we believe we can use the tight money to much better advantage than to have the inventory in dead storage and I think you would be doing your customer a service by indicating to him that he doesn't need this inventory, that when he has it it costs him money. Even space costs money today.

Now, the warehouse stocks are in nowhere near as bad condition as the consigned, but even here we could have better control. In the first five months we averaged 300,000 lbs. more than in the first five months of last year, and our shipments out of warehouse averaged 200,000 lbs. less, so you can see we are getting considerably less turnover there than we did in the same period a year ago. Perhaps it is hard for you to see the connection with the risk we run on the inventory thing, but remember again nearly two-thirds of the inventory is in finished stock. We would like to have those finished stocks to service you but we would like to have them at economical levels.

How could you have helped Rome Cable and the Profit picture in the past year? On July 10, 1956—copper dropped 6 cents a pound, and it went from a total of 46 cents within a year to 29½ and now, as you know, it is 27 cents, the producers price. Remember that during most of last year everybody said, "Well, there's a magic figure of 30—when copper hits 30, why that's about it." Well that isn't true. During a little over a year copper has dropped 19 cents a pound. That is a severe drop when you consider that during the last war copper was priced at 12 cents, during the Korean war it was 24½ cents and in 1949 it was 16 cents. We have had a drop overall, when you consider the price of outside copper, of about 55 per cent. Now based on the average sale out of consignment for 1956 we had 750,000 lbs. a month. If we had had 4 times turnover we could have saved a quarter of a million dollars by postponing our purchase of copper for a year. That is impressive money and you could add to that if you consider the warehouse stocks.

To show what conditions we have been under this last year, copper has not held. For years we went along and we'd think copper would be pretty stable for quite a few months—even a year. It went to 40, then it held there for three months; it went to 36, lasted for three months; then it dropped to 34, one month. It was four months at 32 and [fol. 5650] one month at 29¼; one month at 28½ and, as you know, now it is 27. We still feel, even although copper may seem fairly low, that we should confine our purchasing to what we absolutely need. We have taken, or you have taken, 600,000 lbs. out of our consigned stocks. That is a

good trend, but we should have at least 600,000 lbs. more out of those consigned stocks. A good many of you in discussions have said, "Well, we seem to be the only company that wants to control the consigned stocks." Freddie Marks told me that the other night he had discussions with some General Cable men at the Rome Club and that they are really putting on the heat on that subject. We have heard that Anaconda is very disturbed. We know that Simplex has cut down its inventories of bare wire, or are trying to, from six weeks to three weeks. We know what Westinghouse, what General Electric, what Allis-Chalmers have done in respect to inventories. This is just not a Rome Cable problem. Maybe some of the men out in the field that you meet from other companies don't realize the situation. Maybe it hasn't seeped through to them, but we feel as though it will eventually. Now, a large inventory—and this has been a matter of record in the newspapers—has kept many companies from continuing with their expansion plans because they just plain didn't have the money. That in turn affects our business. Also when we have our money tied up in high inventories we can't afford to give Charlie certain of the equipment which he might request, which in turn would mean more profits, better service, better profits to you. Now, when we have more material in the field we have to have less in Rome. Therefore, you begin to complain about deliveries from here, but remember we have to be controlled by certain things just the same way you do. If we find that we have to reduce our inventories to meet a necessary LIFO position at March 31st and you don't get your inventories down in the field, we can't do it in Rome. That disrupts our plant both at the time we are cutting down and at the time we are gearing up again, so perhaps even this year when we have plenty of copper if you don't do your job next February you will begin to get poorer service and that poorer service might continue through until June. So five months out of twelve you might be very seriously affected.

Copper, as you know, has been very shaky and you may very well ask the reasons for that. Now, I have had photostated an article from Business Week which I think covers it in very good shape and it will save you from listening to more from me. Among the things which they give as

reasons were the rising of refiners inventories, the production increases throughout the world, the lower deliveries to fabricators, poor consumers demand, and the unsteadying influence of the London Metal Exchange. As you probably know, the London Metal Exchange has constantly for many months been considerably under the price in this country. Why do we look at that has been explained by one of the copper men as follows: "The United States sells at prices producers set, except for the 15 to 20 per cent of the custom smelter or outside copper, while the London Metal Exchange is the one great exchange, although the total copper that is moved there is relatively small, that follows the laws of supply and demand." But in addition to the reasons given in those articles I would like to list a few others. We have had an unusual period of labor peace in this country in copper. Chile is willing to sell at the London Metal Exchange which sank as low as 22¾ cents, although in 1954 they held 100,000 tons at the price of 30 cents over the market until the United States bailed them out. You will remember that, perhaps. And the Minister of Mines at that time said the country could not sell the copper at under that figure because it would ruin the economy. This Minister of Mines, although he announced recently a cut-back in production there of some small mines, said that Chile would have to continue the same production and they preferred to increase the production of Anaconda's and Kennecott's mine in Chile, even at present low prices. They have switched around on that from what they felt in 1954. The big producers in this country have been very slow to cut. The primary production for the first eight months of this year is slightly above the average for 1956. They have largely given lip service [fol. 5651] to cuts. The new production has more or less balanced the cutbacks. In the paper this week Phelps Dodge announced that they were going to cut an additional 5 per cent which means that those mines are only going to operate 22 days a month. Now that is hardly a very serious cut and we have yet to hear from Kennecott. Last month one of the big producers sold a considerable tonnage to Spain at a foreign low price. That same big producer has been actively soliciting throughout 1957 business from customers in Europe for electrolytic copper; a thing that that

company has never done in its history before. They have been highly successful in selling over there to these new customers but the price is based on the London Metal Exchange. Well, when that London Metal Exchange price gives that company, when you consider freight and all other costs, 4 cents or more or less than they are getting in the domestic field, it certainly gives the consumer a great deal of doubt as to what the low of the market is going to be in this country. If that company is willing to sell, say, at 23 cents return to them in Europe why are they not willing to sell at the same price in this country? Last month England had 27,000 tons which they announced they were going to sell in the open market. That has just been rescinded. Any consumer has known in the past months that they could get immediate deliveries so what was the sense of buying ahead, and we are still liquidating inventory here.

You all no doubt know what has been happening this last week in the copper market, but I don't think any of us should get disturbed either one way or the other about it. If you were disturbed you wouldn't know whether to smile or cry when you came into the office in the morning because what has happened is this. On the 9th of September the price of copper on the London Metal Exchange was the equivalent of 22-3/4 cents here. On the 12th, it went up to 23-7/8 cents. On the 13th, it went up to 25-1/2. In other words, it was up 13 per cent in four days. Now we were not stampeded into buying. It is true I bought a little bit at 25 cents here and I bought less at 25-1/2. Well, on the 16th—the next day—in London it went down to 24 cents. The next day it started going up a little again and now it is 25-1/2 cents. Now another thing we shouldn't do is to rely on the experts. I will read you what some experts said a year ago. In June, the 28th, 1956, Elliott Janeway wrote as follows (and just keep in mind the price of copper dropped 6 cents a pound on the 10th of July, or two weeks after this); "Copper prices will be vigorously strong over near to intermediate term as British and West European buying zooms following inventory cut-backs and if orders by automobile manufacturers come back in strength. Automobile industry will come back hard in 1957 model year and will not be caught again in squeeze of two-year model car. Any attack on the present domestic producers price of 46 cents a pound

puts pressure on Chile. Chile will probably withhold production if price drops below 46 cents. Outside copper market, London market and custom smelters will go over 50 cents a pound again in relatively short time." About the same time McGill Commodity Service made quite a different projection. "Briefly summarizing the three important facts to consider are these: First, will the demand for copper improve? Our answer is, not materially during the third quarter. In fact, demand will decline. Second, will production be cut back? The answer here is, yes, either through reduced overtime or by a strike. Third, will foreign copper be a stronger threat to the domestic price levels? The facts show the answer to be yes." Well, McGill hit it much more on the nose than Janeway, Lord knows, but even they were wrong on the matter of cut-backs and we are still waiting for cut-backs and here it is 15 months later. We shouldn't believe too much in newspaper headlines. For instance, on September 14th here's what a headline was: "London quotation soars". Well it droped the next day. "Chile to reduce output by 35,000 tons". Well, at the same time in another newspaper it was quoted that the Minister of Mines was urging Kennicott and Anaconda to keep their production up or increase it. "Scrap up 1 cent." It was down on the next Monday, and on the next Tuesday. We believe in a situation such as this that our customers are going to be [fol. 5652] the weathervane as to what happens to the copper price. You can be of great help to us in letting us have information on that. Remember, there is a plethora of supply today, and it is only through a resumption of actually buying that this thing can be stabilized, in my opinion.

Now, how have we faired by staying close to shore and not buying any more copper than we had to. Well, so far this year we have made a very slight profit on copper which is in comparison to last year losing approximately 30 cents a share on our copper and 45 cents a share in the prior year, at a time when copper was going up, so it is a topsy-turvy thing. When copper goes up—a year and more ago we lost money—now it's going down we are making out all right. Now why are we making out all right? The situation can change, of course, because copper pricing is all over the map and it may go back to a former condition. But the

reasons are that we at the present time have several advantageous contracts and we have all our contracts—and that amounts to 50 per cent of our copper approximately—on an average price for the month. Now in the old days we used to have to buy firm weeks ahead. Now what we receive in the month of September, most of it is priced on the average for the month of September. Also we defer our purchasing as late as we possibly can. Our fabricator accounts are getting the benefit of our average at the present time which is running now at under the Engineering & Mining Journal average. They are not getting the benefit of the low customer smelter prices because we do not feel either for their sake or for our sake we can change our general pattern of purchasing, because if we go into the outside market and the customer smelter market exclusively and buy this 25, 25-1/2, 26 cent copper, we will at a time when copper becomes scarce again—and it always goes through these various periods—we will be sitting out on the street corner. Now what are the encouraging signs in copper? As far as Rome Cable is concerned our orders in here on warehouse and consigned are running so far this month under your sales. At least that was true for the first two weeks. Our rubber covered backlog is not slipping, it may be a little bit lower now, but it is not slipping from what it has been in spite of competition and no incentive to buy. Our rubber covered sales April through July were within a thousand pounds of our rubber covered sales for those same months last year. That shows that the rubber covered business has not flown out the window, as many people have indicated. If you include the August, for both years there were artificial circumstances in this month, it means that we had a decrease in the first five months of 6 per cent. Now on consigned, for five months our average was 693,000 lbs. one year and 687,000 lbs. the next year, so to all extents and purposes our consignment sales in the first five months are as large as they were a year ago.

The industry, and we must always keep in mind what Rudy said yesterday, that it was the dynamic electrical industry—it has its ups and downs, yes, but it's always going ahead on the long term. In 1956 it was estimated that copper production would come out at a cost of 25 cents or over on 360,000 tons, or one-third of the production. There-

fore, if you get the price too low those mines producing one-third will shut up if that price is maintained for very long. Now you can read in the paper that Kennecott can produce for 14 cents, and you will read in that article you have down there that some of Phelps Dodge mines can produce copper at 10 cents a pound, but what some of you may overlook is that emphasis that should be put on the word "some". You've got Chile producing an estimated 12 cents a pound, but never forget that the Chilean government charges a tax of 60 to 75 per cent on profits from there; so they are not going to want the price to get too low. Africa, production is estimated between 17 and 20 cents. Another encouraging thing is that a little flurry means buying. We found that out last week in custom smelter purchases.

[fol. 5653] The first reduction in world refined stocks since April occurred last month when it went down 6,000 tons to a total of 424,000 tons which we admit is large. World deliveries to fabricators, and remember that it's world deliveries, have been extremely good. In fact, in 1957 so far their daily average is at an all time high of 7846 tons a day compared with last year's average of 7740 and 1955 of 7519 tons. So the world is consuming more, or buying more. Now the decrease in the United States was approximately 10 per cent. We are also getting to a busy time of year. Standard & Poor's says that there are faint signs of improvement. I learned from a man just coming back from Detroit that the automobile people are not discouraged and are basing sales for this next year at an increase of about 3 per cent. Construction for the first half of this year was 5 per cent over the same period last year and there has been a sudden spurt in orders for the steel-type prefab house. Retail sales have been going up. People have money. We have had automatic wages increases at a time of full employment. The copper industry has for many months been behind the parade, so to speak. For instance, since April 1956 the net domestic consumption of copper has been below its historical relationship to the Federal Reserve Board index of production for seventeen months. Now in the 1953-54 slow down that was true for 15 months. In 1949, another period that wasn't so hot for us, five months. And remember that the Federal Reserve Board is running at an all time high for the past eleven months. So, in my opinion,

with a high economic level in this country we may be pulling out of this sooner than some of us realize, and the final thing is that people may if they study all these different signs begin to realize that the wire industry is one that persuades itself into recession and talks itself into low profits.

Now turning away from copper, aluminum, as you all know, has been in plenty. The aluminum companies evidently have a very funny idea as far as materials and money are concerned. They can increase their prices of the pig product and reduce their prices of the wire and cable products at the same time—go up a cent—down 3, 4 or 5 cents. We have a supply situation there. You've got imports that the U. S. companies have purchased entering into U. S. surplus deals. Certain copper is now going to be released from those so that the aluminum companies will sell it rather than deliver it to the government. You've got a new competitor coming in the form of Oremet at a time when there is plenty of aluminum. Now I would say that you will all agree that Stan Williams has given you your money's worth as far as buying materials for this company. We feel as though that department is very important. Jim McCann has certainly always given a very good account of himself and we have recently bolstered it by having Freddie Marks, Jr. go in there.

Traffic also costs you money. In 1951 we had a bill of $1,200,000. Last year it went up over $1,600,000, or an increase of one-third. This year we may be faced with more. We have had two increases in tariff rates and we may have another. It might go up to $1,800,000. When you figure that with what our earnings were last year you can see how important traffic is. Frank McKevitt, who keeps a very close tab on all these things, had one request which was that you all take advantage of the lowest rates out of your warehouses by combining orders.

We get down to another place that we have had encouragement and that is in the Torrance consigned stock deal. As you all know, those have been discontinued and Ted Lewis deserves a whale of a lot of credit for his part in NEMA and in the persuasion of other companies to discontinue those stocks. We also should say that the Torrance boys have done a wonderful job as far as getting out very large shipments which produced good sales and good profits.

We admit we have one material and money problem out there, and that is at the present time we have very large stocks of raw steel. It totals about three months. In the case of raw steel though we did this on purpose in order [fol. 5654] to get steel in before the price increase, but we are very conscious of the money invested there and Torrence, I am sure, is going to do everything to bring that inventory down within a very few months to 1½ months.

We have not had a chance to discuss many inventory problems at Cope but I am sure that the new members of the family at Cope, whom we are very happy to have with us, will agree that if they are going to get certain equipment needs there, we have to provide money for them and we can provide money in controlling inventory.

In closing I would like to read what Republic Steel put out in a very fine booklet as to their policy. It said, "Republic Steel feels obligated to be a cooperative customer, a reasonable customer, it wants no special favors, no bargains that will cost a supplier to lose money. Republic believes that when other companies make money and grow, it too will make money and grow." Now the only thing I want to leave with you—Why the Hell don't we sell Republic or somebody else like them?

Thank you.

Potential Uses of Aluminum in Insulated Wires & Cables

In order to give a carefully reviewed summary as to the potential uses of aluminum as a conductor in various types of insulated wire and cable the question of economics cannot be ignored and in many cases it may well be the deciding factor. If we consider only the suitability of aluminum from a technical basis we get a decidedly different picture.

For the past three years one of the integrated aluminum producers has been conducting an extensive drive to get aluminum used in many applications. The prices quoted have been in most instances very unrealistic and it is hard

to believe that they would continue to do this for an indefinite period of time.

If we make this analysis at the present time we have no choice except to consider the prices currently being quoted for the aluminum conductor and compare it with the competing copper product. Please keep in mind that I am not referring to special competitive prices that are prevalent in both copper and aluminum wire but to the published prices [fol. 5656] for the respective products.

There is a second factor which is exceedingly important in this type of comparison. We must make some assumption as to the size of conductor which is to be used when aluminum is being compared to copper. For purposes of this study we are assuming that the aluminum conductor is being supplied with the same resistance as the copper conductor.

With the above assumptions as a premise we can now give a general outline of the various types of wire and cable which can be technically and economically justified with aluminum conductor.

I. We are starting with the accepted fact that aluminum conductors both bare and covered is decidedly superior to copper in most instances for overhead transmission and distribution purposes.

II. Magnet Wire. It is doubtful if aluminum will prove to [fol. 5657] be generally suitable or economical in film coated magnet wire.

Aluminum has proven to be technically suitable in fibrous covered magnet wire in the square and rectangular sizes for use in dry core transformers but it has not proven to be economical. These studies were made at a time when copper was selling at prices in the neighborhood of 40¢ per pound. With current price of 29¢ for copper this would make a considerable difference in favor of copper.

III. Flexible cords and cables. It is doubtful if aluminum will prove suitable from a technical standpoint for products subjected to frequent or constant flexing. It is being used by one manufacturer for welding cable but has not gained general acceptance.

IV. Telephone Cable.

a) paper insulated.
b) plastic insulated.

Aluminum has proven suitable for paper insulated cable and would be equally suitable for the plastic insulated cable. The question here is largely a determi-
[fol. 5658] nation of conductor size that would be required. If the aluminum conductor may be of the same size as the copper conductor for use in telephone work it would prove to be economical, but if a larger size would be required it is doubtful if any economy would result.

V. Construction Materials.

We usually consider five different wire and cable products as being in the class of construction materials. We will treat each of these as separate items.

a) Building Wire (Braided)—Rubber Insulation Aluminum has proven to be suitable and economical for the type of wire in sizes #6 AWG and larger. We question either its suitability or economy in the size smaller than #6.

b) Building Wire—Thermoplastic. (Type TW)
Same as Rubber type.

[fol. 5659] c) Service Entrance Cable.
Alminum conductor has already proven itself for this class of cable.

d) Non Metallic Sheath Cable.
It is doubtful that aluminum will prove suitable in this type of cable.

e) Rubber-Neoprene Building Wire.
Same as Rubber Insulated (Braided)

VI. Electronic Wires & Cables.

It is doubtful if aluminum will prove either suitable or economical for these products. They usually involve small size conductors and in many cases are stranded from small sizes of wire.

VII. Power Cable.

In the general category of power cables either for overhead or underground use aluminum has proven to be a

suitable conductor and fairly sizeable quantities have been used with entire success.

[fol. 5660] The economics of the various types and voltages is pretty difficult to cover except by reviewing a whole series of voltages and various types of insulation such as rubber, paper and varnished cambric.

I think a general statement can be made that in most cases for voltages of 5000 and less that aluminum will be found to be economical. For voltages over 5000 it is necessary to analyze each particular situation and study the type of construction, insulation, duct space, etc.

PLAINTIFF'S EXHIBIT 357

January 12, 1959.

Potential Uses of Aluminum in Insulated Wires & Cables

I have reviewed the report which I prepared for you approximately one year ago and have made certain changes that reflect developments which have taken place during the past year.

I. General.

It would appear that the integrated producer referred to in the previous report (Kaiser) has decided to continue the unrealistic prices which were previously used because they have now published price lists which will be referred to in appropriate sections of this report.

Another development which is about to take place is that they are bringing out new conductor tables involving special sizes of conductor that are smaller in cross section than is required to give equal conductor resistance.

[fol. 5662] II. We are starting with the assumption which is already accepted that aluminum conductor (or ACSR) either bare or covered is superior to copper in most instances for overhead transmission or distribution purposes.

III. Magnet Wire.

Our previous summary expressed the feeling that aluminum would not become much of a factor in magnet wire. This previous statement was based on a careful analysis of costs of manufacture. During the past year there have been two public announcements and published prices which might change this picture.

a) The Aluminum Co. has made arrangements with the Rea Magnet Wire Co. to produce film coated aluminum wire in sizes 17 to 24 AWG. We do not produce this type of wire but I am told that the prices are not realistic in relation to costs.
b) Kaiser has published prices on square and rectangular aluminum conductor with paper covering and glass coverings. These prices are from 35 to 40¢ per pound under our prices. If they are prepared to furnish a satisfactory product at these [fol. 5663] prices it will materially affect the thinking of the transformer manufacturers.

Another interesting development of the past year is the announcement of the General Electric Co. that they have produced a 25000 KVA high voltage power transformer using aluminum foil winding and Maloney has produced a distribution transformer also using an aluminum foil winding. The successful performance of these two pieces of equipment may materially affect the use of copper in transformers.

IV. Flexible cords and cables. We have not seen any further developments of fine sizes of aluminum wire being used in cords or cables subject to frequent or constant flexing. It is doubtful if this will prove to be a market for aluminum wire of any consequence.

V. Telephone Cable.

a) Paper insulated.
b) Plastic insulated.

[fol. 5664] Aluminum has proven suitable for paper insulated cable and would be equally suitable for the plastic insulated cable. The question here is largely a determination of conductor size that would be required. If the alumi-

num conductor may be of the same size as the copper conductor for use on telephone work it would prove to be economical, but if a larger size is required it is doubtful if any economy would result.

The A.T.&T. and Western Electric Co. have made comprehensive studies on this subject and with copper priced in the range of 29 to 30¢ per pound it is doubtful that aluminum will be used to any great extent.

VI. Construction Materials.

The following sections give direct comparison of costs of various wire and cable products. These figures show the direct savings which result in aluminum conductor.

Two point should be kept in mind in analyzing these figures.

We believe that the copper prices for 600 volt RR [fol. 5665] and TW are depressed due to competitive conditions and are basically lower than they should be when related to costs. On the other hand we also feel that the published prices of Kaiser are unrealistic with relation to cost.

In order to make a direct comparison of the various classes of products in the construction material field we have selected certain sizes of copper and aluminum conductor and indicated the current prices for the two different products.

In it is important to note that we have selected the appropriate size of aluminum conductor to give equal conductor resistance whereas the new plan of Kaiser would indicate a smaller size thereby showing a still more favorable price comparison for aluminum.

1—Building Wire—Type TW

We believe that this class of product in sizes smaller than #6 AWG with aluminum conductor will not prove either popular or economical consequently our comparisons are based on sizes larger than #6 AWG.

[fol. 5666]

	Type TW		
	Copper		Alum.
$ 6AWG	56.77	$ 4AWG	37.39
4 "	82.84	2 "	54.94
1/0 "	186.20	3/0 "	126.16
4/0 "	337.44	350MCM	267.52
500MCM	766.84	750MCM	503.88

2—Service Entrance Cable—Type SE—Style U

Comparison of the popular sizes of copper and aluminum are shown below:

Copper		Alum.	
# 6/3 cond.	207.48	4/3 cond.	162.64
3/3 cond.	345.80	# 2/3 cond.	209.00
1/0/3 cond.	816.24	2/0/3 cond.	359.48

3—Non Metallic Sheathed Cable.

It is doubtful if aluminum will prove either acceptable or economical in this class of product.

4—Rubber-Neoprene—600 Volt Type RR

Note comparison of prices of copper and aluminum shown below. We feel that the aluminum prices are particularly unrealistic in relation to cost.

[fol. 5667]

Copper		Alum.	
# 6—	90.44	# 4—	59.81
4—	119.32	2—	79.80
1/0—	235.60	3/0—	161.12
4/0—	429.40	350M	358.72
500MCM—	948.48	750M	627.00

VII. Electronic Wires & Cables

It is doubtful of aluminum will prove either suitable or economical for those products. Some work is being done to produce an aluminum conductor with a thin copper coating but this has not progressed to the point where it can be properly evaluated at this time.

VIII. Power Cable (Rubber and thermosplastic insulated)

Aluminum has been found to be a suitable conductor for these applications and the following comparisons show the economies which can be effected by the use of aluminum conductor.

I wish to point out that in the case of the power cable that we feel that prices for copper cable are realistic in relation to cost whereas the aluminum prices (Kaiser) are completely unrealistic.

[fol. 5668]

Power Cable

5KV-Shielded				15KV-Sh.-Grounded			
Copper		Alum.		Copper		Alum.	
# 6	475.95	# 4	366.70	#1/0	1508.60	3/0	1166.00
1/0	921.50	3/0	712.50	4/0	1862.00	350M	1564.00
4/0	1280.60	350	1133.35	500M	2951.00	750M	2292.00
500	2318.00	750	1800.25				

IX. Control Cable

We doubt if aluminum will prove suitable or economical for control cable because they are usually made from small sizes of wire going into stranded conductor.

[fol. 5669] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 359

CC: D. H. THAYER

To: G. E. Rolston
From: J. R. Woods
Date: May 11, 1959
Subject: Aluminum

Dear Glenn:

The purpose of this memo is to express some thoughts and observations on the insulated aluminum market. It is hoped that this information will serve as a basis for evolving sales policies which will promote the use of aluminum and assure Rome Cable a dominant position in the insulated aluminum field.

It is the opinion of the writer that aluminum will eventually gain acceptance as an insulated conductor and entirely supplant copper for many applications. There has been a natural reluctance on the part of contractors and journeymen to accept aluminum because of lack of availability and connector problems, most of which are imaginary. While the trend has been slow, it is growing as evidenced by almost universal acceptance of aluminum SE and aluminum building wire on so-called "monumental jobs". It is recalled that aluminum secondaries became popular almost overnight in spite of violent objections on the part of many utility engineers. These engineers used the same arguments, connector trouble and not available. Aluminum for this application was initially accepted as a matter of necessity, but its acceptance was sustained by cost savings and satisfactory performance of the light metal. It is felt

that a similar, if not so spectacular, transition in the insulated wire field is eminent and will be precipitated by the volatile price and uncertain supply of copper. Once this change starts, the inertia will be in the opposite direction and the market will grow firm in favor of aluminum.

We have a very substantial interest and investment in the copper wire business. It is difficult not to instinctively protect this market. On the other hand we have an overriding obligation to Alcoa to do everything possible to promote the sale of aluminum. It is an unfortunate choice to make but it seems that the only kind of choices the wire industry ever presents are unfortunate. We should certainly make every effort to protect our copper business but it is likely that much of it will be lost by attrition. Aluminum, on the other hand, is growing. If we enter the aluminum field aggressively we can exert a great deal of influence and emerge as the leader in the insulated aluminum conductor market. Profitless aluminum prices discourage active participation in this market but we cannot afford to let Kaiser make us an also ran in the transition to aluminum. Any plans we make will be greatly influenced by our competitors' principles and policies, so I have attempted to analyze them in an effort to forecast their marketing programs. The conclusions I have drawn are based on past competitive practices, informal conversations, and to a great extent conjecture.

Reynolds—Although they are second only to Alcoa in the primary production of aluminum, they have not been very successful in the sale of aluminum conductors. Their sale of overhead conductors may be substantial but their over-[fol. 5670] all market position is weak. Their limited success is based partly on the REA agreements which have hurt them with utilities and partly on cut prices that utilities could not resist. They do not have production facilities for other than bare and covered conductor and in spite of rumors to the contrary, I am led to believe that they do not plan on entering the insulated conductor field in the near future. They do not have a field sales force capable of promoting insulated aluminum conductors nor do they have distributor relationships essential to marketing this product. I am told by their manager of electrical markets sales that Reynolds management cannot justify entering the insu-

lated conductor market unless they can show a profit. This is, in their opinion, impossible in view of published prices. It would be dangerous to assume that they will not change their minds and purchase a going concern particularly if some of the independents find it expedient to sell at a bargain price in face of the depressed copper prices and impossible aluminum prices. For the time being Reynolds feels that they can best serve the interests of aluminum by educational promotion and then supporting independent fabricators by establishing sales policies and prices that will enable a fabricator to process aluminum at the same profit margins as he has had on copper. While this philosophy is admirable, it has little chance of success. Either rods would have to be reduced to a price below pig or the price of the insulated aluminum would have to be adjusted to reflect the true inherent savings in the light metal. The first is impossible and Kaiser shows no inclination to recognize the second. Reynolds must be considered as having little influence unless they purchase a going concern in which case they will have decided to compete with Kaiser and will have to be evaluated accordingly.

Kaiser Aluminum & Chemical Sales—Trying to rationalize this competitor's behavior is one of my favorite and most fruitless pastimes. They must certainly be conscious of profits but everything they do seems to refute this. I am reduced to measuring their success in terms of market acceptance and on this score they have shown outstanding results. They have an imaginative and aggressive sales department, backed up by a competent engineering staff and oustanding sales promotion people. They are in short a tough competitor. They attained their stature in the overhead conductor field with a combination of cut prices and good salesmanship. They have now assumed leadership in this field and are exercising that leadership to enforce price stability that should make the copper industry envious. While this stability is not at a desirable price level, it is nonetheless a significant accomplishment.

Their present unrealistic pricing policies on insulated aluminum can only be justified on the assumption that they plan to overcome resistance to aluminum at the expense of immediate profits in anticipation of creating a market [fol. 5671] at which they will be a dominant factor and then

adopting realistic price structures. The fallacy we see in this approach is, of course, the fact that the non-integrated producers cannot compete and therefore, will do everything possible to retard the trend to aluminum. Kaiser must realize that their production capability cannot support a mass conversion to aluminum and they must have the cooperation of other producers, particularly in the building wire field. This analysis is based on irrefutable economic facts and should prove that Kaiser is following a path that leads up a dead end street. However, I have too much respect for their merchandising capability to think they have not carefully considered all the angles and decided upon this approach as the only sure way of promoting aluminum in insulated products. Has Kaiser discounted the argument that the independent fabricator will resist the trend to aluminum at promotional prices. Have they reasoned that an independent will produce anything at any price as long as there is a demand for it in the market place and concentrated their efforts on creating that demand. A review of their successful promotion of covered line wire and triplex would give them ample precedent to justify this course of action.

Ten years ago we and the industry would have justifiably argued for a copper substitution method of pricing aluminum covered and triplex and our assumption that the industry would not contribute to the promotion of aluminum at ruinous prices would have been just as valid as the same arguments for a similar procedure on insulated aluminum are today. As valid as these arguments were and are, the fact remains that a demand was created in the market and the wire industry couldn't resist filling that demand. Witness the fact that today we are falling all over each other to manufacture aluminum line wire and triplex at 50 to 60 percent of prices we should get on a copper substitution method. Is it not reasonable to assume that Kaiser is following a sales tack that has already proved effective. I suggest the following as their marketing strategy on insulated aluminum conductors.

1. Establish promotional prices that are so low in relation to copper that they must be considered, especially on large building jobs.

2. Concentrate on so-called monumental jobs with little concern for the fact that aluminum is not generally available from wholesaler's stock. This has two desirable effects—

(a) it gives the builder and contractor a taste of the economies (even though they are false) of aluminum.
[fol. 5672] (b) it trains journeymen in the use of aluminum and dispells their fear of termination problems.

3. Builders and contractors having used aluminum successfully and economically on a monumental job, take a close look at in on their next job. It takes only one contractor getting one job based on the economies of aluminum to make his competitors acutely aware of the necessity of competing on an equal basis. On the next job all the contractors will be looking for aluminum prices. This builds back pressure on the manufacturer through the distributors to manufacture aluminum at competitive prices. There is ample evidence that the wire industry will do anything to stay in business and keep their distributors. It seems logical for Kaiser to assume that the industry will adopt a "you can't do that to me" attitude and satisfy the distributors' demand for insulated aluminum even at a loss. The actions of G. E., Paranite and Narragansett would certainly reassure Kaiser that the rest of the industry would fall in line.

4. Wholesalers' stocking of aluminum is the next logical step. While non-integrated manufacturers might reluctantly go along at a loss on jobs, the figures I see would not permit them to maintain stocks for more than a short time. Having established partial acceptance of aluminum and built up a demand in the market place, is Kaiser's next step to sweeten the price a little to encourage manufacturers to enter the field with both feet. If independent manufacturers will nibble at the market at current prices, wouldn't they go after it aggressively with another 10 to 15 percent on the price. The very low price of aluminum is only necessary to overcome inertia. When the demand is created they can move up a little closer to copper and still capture the market.

Much of the above is, of course, conjecture but many of the elements of such a plan have already fallen into place.

Based upon what has taken place and reviewing their successful tactics in promoting line wire and triplex, it seems reasonable to extrapolate such a policy.

Southern Electrical—This is the only other integrated fabricator of aluminum insulated conductor. They do not have established distributors or an effective sales force and their production capacity is quite limited. Their activity in insulated aluminum is too limited to evaluate. They will certainly be looking for a place to sell metal and building wire presents a perfect opportunity. I would expect to see them actively in the insulated aluminum conductor field, particularly building wire.

Kennecott—They are worthy of mention in view of their 13 percent interest in Kaiser and their announced eagerness to increase their holdings. They are primarily com- [fol. 5673] mitted to the copper industry and unless their stock certificates get them a discount on aluminum, they have no reason to promote aluminum conductor. It would appear that the only influence they would have on the market would be to protect their interest in Kaiser and the copper industry by encouraging realistic aluminum pricing. If Kaiser's sales policies produce sales and profit, it is doubtful that Kennecott's council would be heeded.

Anaconda Wire & Cable—While not a primary producer, they are considered to be one because not everyone in the trade is aware of their corporate structure. Most people consider them a 60,000 ton producer of aluminum and they billed themselves as a prime producer when seeking utility business. Anaconda has always jealously guarded their enviable position with distributors and will have a hard time resisting pressure to furnish aluminum at competitive prices. It is my opinion that they will lose about two distributors to Kaiser before they go after their share of the insulated aluminum market.

All other factors in the insulated wire business, not specifically mentioned above, have no interest in the sale of metal but are only interested in insulating at a profit. If insulated aluminum takes over a substantial part of the market they cannot continue to exist on a shrinking copper market which is already plagued with over production. They will be confronted with the dilemma of closing down or selling aluminum. When faced with this choice in copper,

they have continued to operate even at a loss. There is no reason to believe that the color of the metal will change their habits.

No treatment of this subject is complete without a look at the Kaiser organization which as previously mentioned is very effective. I get the impression from personal competition with them in the field and conversations with their sales management people that they think they are ordained to lead the wire industry to aluminum on their terms. They have elevated some very young men to responsible sales positions and although they may be brash and misguided, they have extremely high morale and consequently they are effective in building sales volume. They are imbued with the idea that aluminum is the best conductor for all applications. They have absolutely no respect for copper wire pricing methods, in fact the best reason they offer for not adhering to copper methods is because it is a copper method. As unpalatable as this may be to the wire industry, it does enhance their reputation with the consumer who, after all, they are trying to sell. Their attitude can best be illustrated by relating a conversation I recently had with their manager of magnet wire sales, a young man who has spent two years in the wire industry. He told me that they [fol. 5674] were very pleased with the price structure of aluminum magnet wire and implied that they were satisfied with the profits they were showing on this product. He justified the lower price by saying that the metal was cheaper, copper wire prices were unjustifiably high, and aluminum permitted higher running speeds. He even thought that the covering speeds on fibrous covered aluminum magnet wire would be faster. I talked him out of this but he still claimed that there were economies in running aluminum film coating and these economies were reflected in the selling price. While there might be some obscure savings in film coating aluminum, I am certain that they do not justify the difference in price and even a cursory analysis of the two prices would prove this. While these arguments can be shot full of holes the fact remains that they have a telling impact on the customer. They have backed up their pricing and selling of magnet wire with descriptive data that the copper industry could have published 20 years ago, but didn't. Their booklet on aluminum magnet

wire is one of the most informative and imaginative presentations I have ever seen. This combination is hard to beat. They thrive on the copper industry's attitude of "don't do anything to disturb the status quo" and counter with "let's do something, even if it's wrong". Our plans to compete with them must certainly reckon with these characteristics.

I would like to recommend a sales policy that would encourage our competitors to actively promote or at least passively accept a transition to aluminum. Such a policy would consist of realistic prices for rods and the finished product, leaving room in between for a fair fabricator profit. This approach would take longer but it would be far less destructive than the Kaiser policy which borders on ruthlessness. Under this policy aluminum would gain on its own merits and everyone would be selling. Unfortunately, Kaiser does not concur with this thinking and unless fabricator pressure, poor operating statements and/or Kennecott's influence can change their philosophy, we have no choice but to beat them at their own game.

If my analysis of Kaisers' sales technique is substantially correct and if the effect is as predicted, they will not only lead the way to aluminum conversion but in the process will become the leading producer of insulated aluminum conductor. We will certainly be expected to encourage the transition but I do not feel that we should resign ourselves to a secondary role in market stature. We have many things in our favor, including the Alcoa-Rome name, size and know how. We can take the lead from Kaiser if the necessary decisions and plans are made now.

Very truly yours, Jack

A. D. R. Fraser
Rome
Mr. L. E. Hickman
Pittsburgh

As you know last week because Bob Williamson was in Pittsburgh, and after checking with your secretary, I asked him to attend the Economics Coordinating Committee meeting, which he very much enjoyed.

When he got back he gave me the statistical data which he received, which included the Economics Coordinating Committee forecast. Under EC Wire & Cable the figures are somewhat at variance from the budget which the Rome Division put together covering aluminum content of wire and cable. Not knowing the person or department who compiled the data I am sending two copies of this letter to you.

The total figures for EC Wire & Cable at 70,000,000 pounds closely approximates our budget on Bare and AC-SR for the year which was, 67,600,000 pounds. We have budgeted a total of 11,500,000 pounds of covered wire which brings the total included under that group to 79,100,000.

Accessories are approximately the same. We had 2,-500,000 pounds vs 2,400,000 on the Committee report. I do not know where aluminum conduit and bus are included, but we had 15,000,000 pounds for conduit and 1,400,000 pounds for bus, bringing the Division total to 98,000,000 pounds.

I am attaching two copies of the break-down of this budget by quarters. If you feel it advisable to pass one along. We have not given you anything on our copper or steel data on this compilation as it would not be revelent or desirable to combine them.

A. D. R. Fraser

[fol. 5676]

1961 Rome Division (Except Cope) Quarterly Budget By Class of Product

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter	Total
Bare & ACSR	16,700	18,500	17,000	15,400	67,600
Covd. Wire	2,500	2,600	3,400	3,000	11,500
	19,200	21,100	20,400	18,400	79,100
Accessories	600	600	700	600	2,500

PRICING
Copper Vs. Aluminum

cc: G. E. Ralston

The following information is submitted per Glenn's request of August 30th.

Column 1: Current list prices of Aluminum constructions shown.

Column 2: List prices required to yield the same net return for covering Aluminum conductors that we receive for covering the same construction in Copper.

Product Description	List Prices Dollars per Mft.		
	Column 1	Column 2	Column 3
#4 Strand Polyethylene Triplex	$127.00	$126.89	$ 103.50
#2 Strand Polyethylene Triplex	171.00	165.00	139.50
#4 Strand RePrene Triplex	138.00	135.96	112.50
#2 Strand RePrene Triplex	181.00	174.06	147.60
#4 Polyethylene Line Wire	42.50	40.51	34.65
#1/0 " " "	85.00	100.83	69.30
#4/0 " " "	168.00	169.79	136.80
#4 RePrene Line Wire	43.00	40.35	35.10
#1/0 " " "	86.00	100.60	70.20
#4/0 " " "	170.00	169.36	138.60

The above calculations do not take freight into consideration. In the case of triplex which is sold F.O.B. Mill with freight allowed, we would gain slightly because of the lighter weight of Aluminum. On Weatherproof, we would gain slightly on Copper by picking up Hawkins Freight.

Column 3: Indicating today's competitive net price level added at your request.

Attention: Mr. P. A. Mihm

Aluminum Magnet Wire

Dear Sir:

We are pleased to outline the method used in pricing Aluminum Magnet Wire in line with your recent request. The price of the proper size and type copper magnet wire should be taken from the regular price sheet then the copper base is deducted, the resultant figure is multiplied by 3.3 and the present aluminum base is added to this figure which will give you the total price.

For example—100 x 350 Aluminum 1 Paper ¼ Lap

Similar material in copper	50.29
Less copper base	−25.00
	25.29
Multiply for aluminum	3.3
	83.45
Plus aluminum base	24.50
	107.95¢ lb.

The 3.3 multiplier is used inasmuch as this represents the difference in weight between copper and aluminum. In other words, there would be approximately 3.3 times as much footage in 1000 lbs. aluminum magnet wire as there would be in 1000 lbs. copper magnet wire.

We trust that this is the desired information and will enable you to complete your estimating.

Very truly yours,
Rome Cable Corporation,
Miss Margaret Jennings.

Re: Distributorship Agreement

Inasmuch as our new Distributorship Agreement will be put into use immediately, we are attaching a copy for your information and review.

We would like to pass on a word of comment, particularly to the Rome Cable Division Managers, regarding the *present Rome consignments*. New agreements are now being prepared and will be mailed to you shortly. You will note that the supplement to the agreement shows four product categories and will indicate the products currently approved for each consignment. For example, a distributor may, at present, have approval to carry only copper wire and cable products on consignment. Before shipment of any of the other three products can be made to his consigned stock, approval must be obtained by submitting an Application For Consigned Stock Approval. The application should indicate the additional products desired and further, show all other information pertinent to the product as outlined in the application.

As mentioned above, the new agreements are being prepared for our present Rome Cable consignments. These will be forwarded to the Rome Cable Division Managers for fur-

ther distribution, either to the individual salesman handling the account, or forwarded to the distributor by mail. We have found in most cases salesmen have indicated a preference to deliver the agreement personally for signature. In areas where this is impractical, a letter of transmittal can be used. The original copy should be returned to Consigned Stock Department, Rome, N. Y. Upon its return the old agreement will be considered as cancelled.

[fol. 5684] As Alcoa consignments are transferred to Rome, we will forward to the Rome Cable Division Managers our new agreements. There will be more details on this part later.

P. J. Lopushinsky.

[fol. 5685] Rome Cable Corporation

Rome, New York

Distributorship Agreement

This Agreement is made by and between Rome Cable Corporation, a Delaware corporation (operating as a division of Aluminum Company of America) having its principal office in Rome, New York (herein called "Rome"), and having an office in _____
(herein called "Distributor").

1. Delivery of Products to Distributor. Rome shall from time to time deliver to Distributor and Distributor shall receive at any of its warehouses, except such as may be excluded herefrom by Rome, such quantities of such products as shall be brought within the scope of this Agreement by subsequent writings signed by both parties (the same being herein called "Products"). The Products may be either the property of Rome or the property of Aluminum Company of America, a Pennsylvania corporation (herein

called "Alcoa"), it being recognized that Rome is acting as agent for Alcoa with respect to such of the Products as are the property of Alcoa. Notwithstanding the ownership of the Products, the transactions contemplated hereby shall be solely between Rome and the Distributor. Rome will deliver the Products, and will bear the cost of transportation for such delivery, to distributor's warehouse, in accordance with Rome's standard practices in connection with sales of the Products to other resellers.

2. Special Charges. If a Product is wound on reels for shipment, the returnable reels will be billed to the Distributor at the time of shipment to the Distributor on the basis of Rome's current reel price schedule. Reels returned in good condition, freight collect, to point of origin or such other point as shall be specified by Rome, will be credited at the prices originally billed to the Distributor. If, at the request of the Distributor, any service is performed with respect to any of the Products, such as, but not limited to, cutting, sawing or boxing, for which a special charge is normally made, Rome will invoice Distributor in the amount of such special charge at the time the Products are shipped to Distributor.

3. Title to, Storage of and Access to Products. Legal title to the Products prior to withdrawal pursuant to Distributor's exercise of its option hereinafter granted shall remain in Rome or Alcoa, as the case may be. Distributor shall take due and proper care of the Products, including the provision of safe, clean and dry storage facilities, and shall keep the Products available for convenient inspection and identification. Rome or its designated agent shall have the right during regular business hours to enter Distributor's premises to inspect or inventory the Products. Except as expressly provided herein, Distributor shall not remove any of the Products from the premises on which they are stored without first obtaining the written consent of Rome.

4. Risk of loss and Insurance. All risk of and responsibility for loss of or damage to the Products prior to withdrawal pursuant to the Distributor's exercise of its option hereinafter granted shall be in Distributor, except that the risk of loss of or damage to the same resulting from enemy attack, including any action taken by the military, naval or air forces of the United States in resisting enemy attack,

shall be in the owner (Rome or Alcoa); provided, however, that the foregoing exception shall not apply to loss or damage resulting from blackout, burglary, robbery, theft, larceny, pillage or looting, sabotage, vandalism, malicious mischief, acts done secretly by foreign enemy or agent of any government, or neglect of Distributor to use all reasonable means to save and preserve the Products after damage from enemy attack. Notwithstanding the foregoing, the owner shall insure the Product against loss or damage by theft, flood, fire, sprinkler leakage, wind, lightning, explosion, riot and civil commotion, aircraft and other vehicles, and smoke while the same are in the possession of Distributor. Such insurance shall be in the name of and for the benefit of the owner, and shall not cover any interest of Distributor. Distributor shall cooperate with the owner and with the insurance carriers with respect to inspections, safeguarding the Products and adjustment of losses. The owner shall be solely responsible for the sufficiency of such insurance and Distributor shall be relieved of all liability for loss or damage from any cause with respect to which such insurance is carried (except loss or damage from flood in excess of $150,000.00) and for default on the part of any insurance carrier. The maintenance of such insurance by the owner shall not, however, in any way relieve or limit the liability of Distributor, hereinbefore specified, for loss or damage from any cause other than those with respect to which such insurance is carried.

5. Taxes on Products. Distributor shall pay all local property taxes and all other municipal and governmental charges (other than taxes on or measured by income) which may be assessed against it, against the owner of the Products, against Rome as agent for Alcoa, or against the Products or any of them by reason of their storage and existence in the state in which Distributor's warehouse or place of business may be located. If Distributor shall fail or refuse to pay any such tax or charge, Alcoa or Rome may pay the same and Distributor shall reimburse Rome for the amount thereof.

6. Filing Requirements. If Rome so requests, the Distributor will file this Agreement or a copy hereof in the manner provided by law, and will do all other things necessary to make this Agreemnt legal and valid and to assure to

Rome and Alcoa their respective rights, reserved or recognized herein, under the laws of each state in which the Distributor operates.

7. Reports. Rome shall from time to time supply Distributor with report forms and instructions for completion of such forms. On the_____day of each month, Distributor shall report to Rome on such forms, in accordance with the instructions relating thereto, and as of the date specified in such forms or instructions. In addition, whenever Distributor is notified of a change in Rome's published prices, Distributor shall report to Rome on such forms as of the close of business on the day before such price change became effective.

[fol. 5686] 8. Distributor's Option to Purchase. Rome hereby grants to Distributor an option to purchase all or, from time to time, any part of the Products at Rome's price in effect at the time of exercise of such option, less such discount, if any, as Rome may from time to time establish. Exercise of the option with respect to any of the Products shall be by withdrawal thereof from the stock of Products. After such withdrawal Distributor shall not return any withdrawn Products to the stock of Products but shall keep the same properly segregated therefrom as its own property.

9. Invoicing and Payment. On receipt of each report made by Distributor pursuant to paragraph 7, Rome shall invoice Distributor for all products with respect to which Distributor exercised its option during the period covered by such report. Distributor shall remit to Rome for such Products in accordance with the regular terms and sales policy for such Products as of the time of sale, as contained in the published price sheets of Rome.

10. Sales by Distributor. All Products which Distributor purchases hereunder will be sold for its own account. No sales from stock shall be made by Distributor as agent for, or other representative of, Alcoa or Rome. No sales or contracts made by Distributor shall make or purport to make Alcoa or Rome a party, nor shall Alcoa or Rome incur any liability thereby or therefor.

11. Financial Statement. Distributor shall furnish a financial statement to Rome at such time or times as Rome shall request.

12. Slow Moving Products. Any Product which remains in Distributor's stock for six months may, upon the request of Rome, be returned to such destination as Rome shall designate, transportation charges to be prepaid and borne by Distributor. In the event that a Product is still in Distributor's stock at the end of eight months after Distributor's receipt thereof, Rome may invoice Distributor for such Product at Rome's price in effect at the time of invoicing. Upon receipt of such invoice Distributor shall exercise the option to purchase such Product and shall take it into its own stock.

13. Broken Packages. If Distributor shall break into any standard package full coil of electrical conductor, such breaking in shall constitute an exercise of the option to purchase the entire package and any remainder shall be taken by the Distributor into its own stock. Where covered or insulated electrical conductor is shipped to Distributor on reels, the Distributor will report the amount sold each month until there remains on the reel 200 feet or less, and at that time it shall exercise the option to purchase the balance and shall take it into its own stock.

14. Termination. Either of the parties may terminate this Agreement with or without cause, upon ninety days written notice delivered at the office of the other party or at such address as shall be supplied for the purpose of such notice. Notwithstanding the foregoing, if any proceeding in bankruptcy, receivership or insolvency, whether voluntary or involuntary, shall be instituted by or against Distributor, or if Distributor shall become insolvent or its corporate existence shall for any reason be terminated or its affairs wound up, or if Distributor shall make any assignment for the benefit of its creditors or commit any other act of bankruptcy, or if Rome should have reason to question the financial stability of Distributor, then and in any such event, Rome may terminate this Agreement immediately upon written notice to Distributor. In the event of termination of this Agreement, however caused:

(a) Distributor shall forthwith transmit to Rome a statement of the Products on hand and tsales made from the Products from the date of Distributor's last report to the effective date of termination, and

shall immediately remit to Rome for the Products so sold; and

(b) Distributor shall forthwith, and at the cost and expense of the party terminating the Agreement, ship to such point as Rome shall designate all Products then in the possession of Distributor.

15. Modification of Agreement. This Agreement shall, with respect to the subject matter hereof, constitute the entire contract between the parties and supersede all existing agreements between them, whether oral or written. There are no verbal understandings or undertakings of any kind with respect hereto not expressly set forth herein. No agent of Rome shall have authority to change or modify any of the terms of this Agreement, except with and to the extent of the written consent of Rome. Any such change or modification made with regard to any particular order or orders, or with respect to any particular term or condition of this Agreement, shall apply only to the particular order or orders or term or condition with respect to which such change or modification shall have been made, and shall not be construed as a general waiver or modification as to any other order or as to any other term or condition of this Agreement.

16. Assignment. This Agreement shall be binding upon and inure to the benefit of the parties, their successors and assigns, but Distributor shall have no right to assign this Agreement without first obtaining the written consent of Rome.

17. Governing Law. This Agreement shall be construed in accordance with the laws of New York.

The parties have executed this Agreement in duplicate this_____day of_____, 19____.

Rome Cable Corporation By____, ____.

Re: Aluminum Substitution

The attached paper was prepared as a discussion outline for presentation to the Rome Cable Division Field Sales Personnel during their training program here at Rome. We have received requests for copies from the salesmen who participated in the program and from several field locations since their return. In view of this interest, we are sending copies to all personnel interested in the sales of Insulated Aluminum Conductor.

[fol. 5690] Discussion Outline for Alcoa Sales Personnel

Economics of Aluminum Substitution Facts and Fallacies

I'm rather amused when I hear the margarine interests refer to "the high priced spread" rather than coming right out and saying "butter". This doesn't make much sense to me but I respect the judgement of professional advertising people, so at least during the initial stages of this discussion I'll refer to aluminum versus the high priced metal.

Now I am going to pose a question to each of you and I want you to give me an honest answer. I don't want the fact that you are a guest in the "Copper City" to influence your answer and I want you to forget, if possible, that your pay check comes from Alcoa. I'm going to give you some facts and I want you to put yourself in the buyer's position and tell me which metal you would specify for your insulated electrical conductor.

First, there is the high priced metal. It has nearly twice the conductivity of aluminum; it has a scrap metal value nearly as high as its original cost; it is ductile; it is easy to terminate; it is so easy to refine and fabricate that even the ancient Aztecs used it for utensils and jewelry; for equal ampacity and voltage drop it is smaller than aluminum; it takes less space and requires less insulation; it is not adversely affected by soil acids and alkalies and it is extremely easy to join and solder.

Now, let's take a look at aluminum. It has less conductivity; it uses more space and insulation per ampere; it requires special handling, special terminations and special techniques. Of course, it is lighter, has a lower more stable price and is in more plentiful supply.

[fol. 5691] Now, as a purchaser with these facts, tell me honestly, would you really buy aluminum or would you go the easy route and choose the high priced metal?

Those of you who are inclined to confess that you would choose the high priced metal didn't ask how high is "high priced". If you had asked this question, you could never have had any doubt in your mind because the high priced metal I was describing in such glowing terms was not copper but silver. It is doubtful that very many people would specify a silver conductor even though it does have all of

the desirable characteristics I outlined. I resorted to this subterfuge to bring home the point that silver, copper and aluminum are all good conductors, but the cost, availability and to some extent habit are the factors that determine which metal will be used. Aluminum will be specified over copper only because it has a lower price tag and is more plentiful and then only when a good selling job is done. How quickly and how completely aluminum displaces copper will depend entirely upon the relative cost and availability of these two metals, and how good a job we do of reminding the customer that silver and copper are superior conductors, but relatively expensive.

Let's look at the true facts that determine the economic advantage of aluminum over copper in both bare and insulated wire.

There are some basic facts that are as irrefutable as Ohm's Law. Let's analyze aluminum versus copper in the light of these facts first, so that we will all understand exactly where we stand. It may, at times, be to our advantage to distort these facts, but as good salesmen and good businessmen let's start with a basic understanding of true economy. Then, we can consider the commercial aspects that might influence us to go beyond true economy to prove in aluminum.

Here are some facts that are worth remembering when talking about aluminum versus copper.

[fol. 5692] Copper has a resistivity of 10.37 ohms per circular mils foot
Aluminum is next best with 17.0 ohms per circular mils foot
Copper has a specific gravity of 8.89
Aluminum has a specific gravity of 2.70

You can work out a ratio on this and come up with the fact that one pound of aluminum will do the work electrically of two pounds of copper. That is, an aluminum conductor will offer the same resistance and result in the same losses as a copper conductor weighing twice as much. You can come up with this fact by remembering that aluminum weighs .3 times as much as copper. Physically, three tenths of a lb. of aluminum will do the job of 1 lb. of copper. However,

aluminum has only 62% conductivity, so electrically you must divide by .62, which results in the figure .50 or ½ lb. of aluminum is the electrical equivalent of 1 lb. of copper. Don't forget and don't let your customers forget that they must buy 2 lbs. of copper at 33¢ to do the job of 1 lb. of aluminum at 26¢.

Now let's apply this rule of thumb to the wire business and see how we make out. You are all familiar with the fact that #4 aluminum is roughly the equivalent of #6 copper. Let's assume for the sake of this discussion that it costs us the same amount of money to reduce the aluminum pig to a #4 solid as it does to reduce a wire bar to #6 solid. While there is certainly some room for argument on this, it is a reasonable assumption and it will not have any significant effect on our analysis. It is undoubtedly a little cheaper to reduce the aluminum but let's save the difference and increase Alcoa's earnings from $2.52 to $2.53 per share. If you will go along with me on this assumption, we will go back to #4 aluminum versus #6 copper.

1,000 ft. #6 copper weighs 79 lbs. and at 33¢ per lb. the metal costs $26.07
1,000 ft. #4 aluminum weighs 38 lbs. and at 26¢ per lb. the metal costs $9.88

[fol. 5693] Note that the 1 lb. of aluminum is more than doing the work of 2 lbs. of copper and going back to our assumption that it costs about the same to get both into wire form, we find that our customer can save about $16.00 per thousand feet by using aluminum. This is a true metal savings and when coupled with your superior salesmanship, it has made a lot of copper available to the costume jewelry trade that used to go into transmission and distribution conductors.

$16.00 per thousand feet is a pretty healthy advantage for aluminum and it assures our position in the overhead conductor business. It is unfortunate that some irresponsible price cutting has widened this gap to $20.00. That extra $4.00 is coming out of our hide, when, as a matter of fact, we don't even need a $16.00 advantage to sell aluminum.

Bearing in mind that we are still talking about the true economics of aluminum over copper, let's see what happens

to this $16.00 savings when we start putting insulation on the conductor. We will start with a simple polyethylene line wire and then progress to more complicated constructions to illustrate the point.

If we apply 1/32" polyethylene over #6 solid, it requires 8 lbs. of compound. To apply 1/32" polyethylene over the larger #4 aluminum, requires 10 lbs. of compound. This additional two lbs. of material at about 35¢ per lb. means we must deduct 70¢ per thousand feet from the $16.00 saving to arrive at our true savings. In addition to increased material costs, there are increased labor costs. If the extruder has a capacity of 160 lbs. per hour, we can insulate 20,000 ft. of #6 solid per hour, but only 16,000 ft. #4 solid. Our labor costs and all other costs that are tied to production capacity have increased 25%. It is evident that the $16.00 savings is no longer valid. We have got to deduct the increased material and labor costs incurred and pass the [fol. 5694] balance along to the customer as an incentive to buy aluminum. Let's say this saving is now only $14.00 per thousand feet, still a healthy advantage and more copper for the costume jewelry trade.

Now let's go a little further and see what happens to our $16.00 metal savings when we decide to make a more complicated cable. If we were to apply 12/64" insulation, we'd find that it takes 85 lbs. for the #6 copper and 95 lbs. for the #4 aluminum. This means that the material cost is up $3.50, as a consequence of using aluminum. As in the case of the 1/32" polyethylene, there is an increased labor cost. So, our true savings on this more complicated construction is say $10.00 versus $14.00 on the simpler construction. If we were then to shield this wire, it would cost $4.50 more for the shielding tape to cover the larger diameter and our metal savings would be reduced to $5.50. It is obvious that by extrapolation we can arrive at a point where the metal savings are overcome by the increased costs of processing a larger diameter conductor. How soon, if ever, we arrive at this point, depends entirely upon the amount and the cost of the covering material.

I have tried to lead you down the path of so-called metal substitution pricing. Simply stated, this method merely means that to price an aluminum cable we subtract the copper metal cost from the copper cable selling price and add

back in the aluminum metal cost in its place. The validity of this method is based upon the assumption that it costs the same amount of money to reduce an aluminum pig and a copper wire bar to a finished conductor and that the price of the copper cable was based on a correct cost versus selling price ratio in the first place. There is a great deal of room for argument on both of these assumptions and, as a matter of fact, we know they are not entirely correct. However, metal substitution is a reasonably accu- [fol. 5695] rate reflection of the true economy of aluminum over copper and, more important, it is the only real yardstick we have for measuring an Insulating Plant's profit performance. The copper wire and cable business is not a high profit industry. If we can make 4% on sales we are doing extremely well. Every time we sell insulated aluminum at a price lower than the metal substitution formula, we are taking the difference out of our potential profit and there can be absolutely no argument about that fact.

So much for the economic facts of aluminum substitution. We should all know and be guided by these facts but selling is an art and not a science, and unfortunately facts do not always prevail in the market place. We are all anxious to sell aluminum. We are even more anxious to sell Alcoa aluminum. But, I, for one, dislike working for a non-profit organization. If it comes to that, I will get a great deal more satisfaction as a member of the Salvation Army. We may find it expedient to distort the facts a little to give a bigger edge than the metal savings will justify. If we do this in the form of meeting competition to maintain our position, or to introduce and promote aluminum on the assumption that we can raise the price a little after the customer finds out that he really likes it—O. K. If, on the other hand, we try to prove in aluminum where there is no real savings, we are in trouble. To give you an example of this, imagine the spot you would be in if you reduced the price of insulated aluminum cable way below cost just to get the customer to switch over. After he had redesigned and retooled for aluminum, you come back and want to raise the price to a profitable level. If there was no real savings in the first place, you must either raise the price above an equivalent copper cable or go without profit—

you can't win. You end up with an irate customer or a profitless organization. The point I am trying to make is, [fol. 5696] we should strive to sell aluminum on the basis of its true economic advantages. We may have to settle for a temporary narrow margin to get aluminum accepted, but in the long run aluminum should stand on its own two feet if our gains are to be permanent.

Up until now we have talked about the economics of aluminum in the finished electrical cable only. The customer is obviously interested in installed cost rather than conductor cost. So, let's see what happens when we start using an aluminum cable versus a copper cable.

When we started this discussion, we found that the maximum savings on a #4 aluminum was $16.00. We then started to peck away at this until the savings were down to $5.50 per thousand feet. When we install this cable, it takes more space and enclosed space costs money, so the savings to the customer may be further reduced. If, after taking this last factor into consideration, there is still something left of the $16.00, and there usually is, then installed aluminum cable is cheaper than installed copper cable.

Now that I have beat down your $16.00 to the point where aluminum doesn't look as good as it did, I'm going to build you up again by pointing out that aluminum can, in many cases, do the job of copper without an appreciable increase in size. When conditions permit the substitution of aluminum for copper on a current carrying capacity basis, we practically have a license to steal. We learned earlier that based on voltage drop, a lb. of aluminum would do the same electrical job as two lbs. of copper. On a current carrying capacity basis, that same lb. of aluminum will do the job of about 2½ lbs. of copper. Service entrance cable is a good example of permissible substitution of aluminum for copper on an ampacity basis. The run is short, the voltage drop is of little consequence, so a #2 aluminum can be substituted for a #3 copper for 100 ampere service. The [fol. 5697] #2 aluminum weighs 61 lbs., versus 162 lbs. for copper. There are many other cases where aluminum can be substituted for copper without increasing either the conductor size or the conduit size. For instance, there are 16—440 volt 3-phase motor sizes between ½ and 100 h.p. 62% of these motors can be fed with aluminum cable with-

out an increase in conductor size. 75% of the circuits can be run with aluminum conductor without increasing the conduit size. To take advantage of sustituting on an ampacity basis requires engineering and selling in the design stages of the electrical system. Without complete knowledge of the system demands, we must take a conservative approach and substitute on a voltage drop basis.

It is beyond the scope of this discussion to cover all of the intricacies of aluminum substitution. We are ready to help you on jobs as they come up and you will be given a great deal more ammunition along these lines in the near future.

I would like to sum up this discussion by repeating some salient facts.

1. We are willing and anxious to substitute aluminum for copper in insulated cable.
2. It is generally economical to substitute aluminum for copper.
3. It is to everyone's benefit to prove in aluminum on actual rather than artificial savings. It is a good metal and can stand on its own two feet.
4. Copper is, has been and always will be a better conductor than aluminum. Don't weaken your position by trying to deny it. Silver is also a good conductor, but who can afford it.
5. The strong points of aluminum are adequate conductivity, plentiful supply, light weight and a low stable price.

In closing I would like to invite your attention to two very important figures that I just happened to run across the other day. They were 858,460,213 and 2.52. You may recognize them as our company's 1959 net sales and earnings per share. You, your fellow salesmen and everyone here in [fol. 5698] Rome Headquarters Sales have an opportunity to add a digit to the first number above. If we do it, it will be very gratifying. If, however, we contribute the added digit without making a corresponding contribution to the 2.52, we haven't accomplished a thing. In other words, sell something. Preferably sell aluminum. Sell copper, sell steel, sell Rome Cable Manuals, sell anything, but sell it at a profit.

J. R. Woods.

[fol. 5699] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 367

Internal Correspondence

September 6, 1960.

From: J. B. Holloman, Rome Cable Div., Rome
To: See Distribution List

Electrical Conductor Distributor Memorandum No. 3
Sale of Overhead T&D Conductors Through Distributors

The purpose of this letter is to outline our policy regarding the sale of bare and weatherproof aluminum conductors through electrical distributors. So that there will be no misunderstanding about the products involved, they are listed below:

Bare ACSR and Bare all-aluminum conductor
Weather-resistant aluminum line conductors
Aluminum self-supporting secondary and service drop cables
Rome Trimline Primary Distribution Systems

The greater volume of these products continues to be sold direct to the user. Any distributor sales program we follow must recognize this fact. If our selected distributors are willing to provide a service under these circumstances, it is our intention to support their efforts in every reasonable way.

It is apparent that we now have too many distributors for these products. We cannot expect full cooperation from our stocking distributors if we continue to sell through those who do business with us only as a matter of convenience. The program by which we expect to arrive at more restricted distribution will be developed in the following specific steps:

1. Consigned Stock Distributors. Rome Division distributors who have consigned stocks of these conductors now number in the hundreds. The consignment method of dis-
[fol. 5700] tribution has certain advantages, particularly

where the manufacturer also sells direct to the user. As we have elected to do business through consigned stocks, we must reduce our variety of selling methods to gain the maximum cooperation from our consignment distributors.

2. Purchased Stock Distributors. Except in a very few locations, the distributor who buys conductors into his stock is not compatible with the consignment distributor. It is difficult to control the type and quantities of material that move through purchased stocks. Accordingly, the purchase of these conductors into stock is eliminated. This applies also to the consignment distributor who obtains orders for conductors he does not carry in his stock. We will in such cases require the item to be shipped directly to the user.

3. Agency Sale of Overhead Conductors. Attached is a copy of the Agency Agreement similar to that which has been used by Alcoa for a number of years. This agreement provides a valuable service to our distribution program by permitting the Agent to sell only at prices authorized by the Rome Division. In addition to a number of individual agreements, we have national Agency arrangements with the following organizations:

Graybar Electric Co.
General Electric Supply Co.
Westinghouse Electric Supply Co.
Line Material Co.

All distributors who stock these products have signed or will be asked to sign Agency Agreements. The discounted drop shipment of overhead conductors is now eliminated, and future shipments direct to the user will be made only as an Agency Sale. Administration of Agency orders will not be discussed here, as Alcoa sales offices should be familiar with the entry procedure.

[fol. 5701] 4. Designation of Agency. You will from time to time receive orders for these products from approved Rome Cable Division distributors who do not have stocks or who are not signed agents. These orders may, at your option, be returned to the distributor or entered on the so-called "one-shot Agency basis".

We have attached a copy of the "Designation of Agent"

form and also, in part, a copy of Mr. Dixon Lewis's memorandum No. 43 dated January 21, 1955, which explains the procedure under which it is used. Our present policy limits the use of the Designation of Agent Form to approved Rome distributors. Supplies of this form are being mailed to all district, branch, and resident offices. They should be put into use immediately.

5. Discounts & Commissions. For your convenience, we have listed on the attached sheet the Agency commissions for sales of these products, as well as the discounts that apply to sales out of consigned stocks.

6. Control of Quantities Shipped into Stock. The 4.25% stocking and handling fee is allowed to distributors only on conductor actually shipped into stock. Wherever it comes to your attention that these products are being diverted and are not going into the distributor's warehouse, the allowance should be withdrawn. This should be clearly understood by the distributor handling our products. We expect the distributor to carry adequate stocks of the items which he normally sells. Requirements for non-stock items or large quantities of stock items must be justified for shipment to the distributor or shipped direct to the user on the agency basis.

These steps have been taken to provide a more orderly method of doing business through distributors. In view of competitive practices common in today's market, such a [fol. 5702] course of action places additional responsibilities on the sales department. However, any compromise of the distributor function prevents its proper balance with direct selling. This balance must be maintained if we are to promote a sound distributor program.

J. B. Holloman.

[fol. 5703] Attachment

Gentlemen:

We hereby engage_____, to act as Agent under the terms specified herein, in the sale of our electrical conductor and accessories for direct shipment to customers located in the_____.

Your representatives will normally obtain the selling prices which they are authorized to quote from our district or branch office having responsibility in the area where the business is done.

The orders which you obtain on our behalf must be transmitted through such office and are subject to acceptance by us in Rome. Such office may also designate certain customers which are excluded from your agency.

This arrangement is non-exclusive in both directions, i.e., we are free to engage other Agents for the same purpose and you are not bound to sell bare and covered aluminum and copper overhead conductors and accessories on our behalf only and we are free to solicit and accept orders directly from these customers. Commission will apply only to orders actually secured by you.

As a matter of convenience, we will expect, in each case, to receive instructions from you as to material specified, and the terms and conditions of the customer's order. The [fol. 5704] memorandum of sale received by us from you should contain the following notation:

"This order covers merchandise sold through us as your agent, and we assume responsibility for payment. Invoice should be rendered directly to us."

After having shipped in accordance with your instructions, we will look to you for payment since you are assuming full responsibility for such accounts, including collection and payment to the taxing authority of sales or use taxes when applicable. In rendering our invoices to you, allowance will be made for your selling commission.

For these specific services we will pay you the following commissions on orders secured by you as Agent and accepted by us for direct shipment by us to customers:

Aluminum

Bare ACSR and bare all-aluminum conductor
(a) Sizes #6 AWG through 336,400 cm, any quantity 3%
(b) Sizes larger than 336,400 cm, any quantity 2%
Weather-resistant line conductors.....4%
Self-supporting secondary and service drop cables 4%
Accessories 5%

Copper

Bare solid and stranded copper overhead conductors $.005/#
Weatherproof solid and stranded overhead conductors $.0075/#
Rome Trimline Primary Distribution Systems.....5%

You shall absolve us from all responsibility for any claims where such claims exceed our limits of responsibility as set forth under "Terms and Conditions" printed on the back of our regular "Acknowledgment of Order". There are no [fol. 5705] reasons to expect that selling of our electrical conductor and accessories will involve you in any patent suits but it is understood that we take the responsibility of protecting you in this respect.

We think the above paragraphs describe the arrangement completely but it may be well to call attention to the fact that your Agency arrangement does not include orders from you for shipment to your own stores for resale, or to any other reselling stores.

Naturally, there may be reasons for review occasionally, and we shall each feel free to call on the other for that purpose. Also, it is agreed that this letter is effective as of _____and may be cancelled by either party upon three months' notice.

Will you please signify your agreement by signing, dating, and returning the attached duplicate signed copy of this letter.

Very truly yours, Rome Cable Corporation.

JBH:jb

[fol. 5706] Rome Cable Division of Alcoa

Rome, New York

Name
Address

Designation of Agent

We have taken the liberty of acknowledging your order No._____dated _____(subject to acceptance at our home office in Rome) as a sale by us to the customer designated as the consignee therein, through you as our agent. The attached acknowledgment of your order as an agency transaction is subject to the following understanding:

1. This is not a sale to you for resale.

2. You are hereby designated our agent with respect to the single transaction represented by the attached acknowledgment of our Sales Order No._____, dated_____, with authority, as an undisclosed agent for us, to sell such material to the consignee named therein under the terms stated on such acknowledgment.

3. You shall assume responsibility for payment and as a matter of convenience the invoice or invoices for such material will be rendered directly to you.

4. If state or local sales or use taxes are applicable to this transaction, you shall assume responsibility for collection of such taxes from the customer and for remitting the same to the taxing authorities.

5. For your services in connection with this transaction we will pay you a commission of_____% of the gross price of the material shown on the invoice. The commission will be deducted from the invoice which will be rendered to you.

We appreciate the opportunity to serve you and hope that you will accept this designation of agency. We shall assume that you have accepted the above conditions unless we hear from you to the contrary within five days.

Very truly yours, Rome Cable Corporation.

Electrical Conductor Memorandum No. 43
by Dixon Lewis, Pittsburgh—January 21, 1955

(Quoted in Part)

We are concerned with two types of orders from resellers of electrical supplies and equipment, and both types can be converted into agency transactions. The first type is the order from a supply house for direct shipment to a customer who is named on the order as the consignee. By attaching a "Designation of Agent" form to the acknowledgment copy of the sales order, such an order can be entered immediately by the sales office as an electrical conductor agency order, showing proper commission deductions in the pricing column and carrying the usual agency responsibility and sales or use tax notations as outlined in Electrical Conductor Memorandum No. 31 and No. 39. In addition, the following acknowledgment note should be added on the sales order form: "Designation of Agent Form Attached to Acknowledgment".

The "Designation of Agent" form should be prepared in triplicate and the original attached to the acknowledgment copy of the order which is mailed to the supply house. The duplicate copy will remain with the sales office copy of the order, and the triplicate will be mailed to the Product Manager's office in Pittsburgh.

[fol. 5708] Note that the supply house has five days in which they can refuse to accept the agency designation. In this event it will be necessary for the sales office to cancel the order as we have no other arrangement for selling to a supply house for resale.

The second type of order is one in which the supply house ordering the material is also named in the order as the consignee. Since this material is obviously for resale, such an order must be rejected unless it can be converted into an agency order by obtaining the name of the ultimate customer as the consignee. One way to do this is to telephone the supply house, explain our agency arrangement, and ask them to give the name of their customer to be inserted, in the order. Another way is to use the attached suggested form letter to "X-Y-Z Electrical Supply Company", accom-

panied by a blank "Designation of Agent" form. If upon receipt of this letter the supply house elects to return the order with their customer's name, then the "Designation of Agent" form will be prepared in triplicate and the original attached to the acknowledgment copy of the sales order when it is entered, in accordance with the procedure outlined above.

It is immaterial whether actual shipment is made direct to the customer or sent to the customer in care of the agent's warehouse or shipping dock; the essential point in the agency order is that the ultimate customer be named in the order as the consignee. Note that the "End Use" in all agency orders is the use by the ultimate customer and [fol. 5709] not by the agent, and that the customer must be the actual user of the material such as a power company, cooperative or contractor.

The foregoing procedure is not only a protection to everyone concerned but we believe it is fair to our established agents and distributors. The sales office always has the option of refusing to accept an order from a supply house because of policy reasons. Special situations should be discussed with the Product Manager's office.

[fol. 5710] Rate of Commissions for Agency Sales

Aluminum

Bare ACSR and bare all-aluminum conductor

(a) Sizes #6 AWG through 336,400 cm, any quantity 3%
(b) Sizes larger than 336,400 cm, any quantity.. 2%

Weather-resistant line conductors 4%
Self-supporting secondary and service drop cables. 4%
Accessories 5%

Copper

Although bare and weatherproof copper are included in the revised Agency Agreements, there is no present intention to change the existing method of sales for these products. Both discounted drop shipments and purchasing into distributors' stocks are to be continued.

Rome Trimline Primary Distribution Systems..... 5%

From: J. B. Holloman Rome Cable Div., Rome
To: A. K. Buckenmaier, Detroit

Re: Fitzpatrick Electric Supply Co.

Attached is a photostat copy of the signed Agency Agreement between the Rome Cable Division and the above distributor. This Agreement superseded the original Alcoa Agency Agreement and was sent directly to the distributor for signature. Attached also is a letter of amendment dated January 9 which reflects the change in commissions on certain conductor sizes.

We suggest you keep these Agreements and letters of amendment as a part of your permanent file.

J. B. Holloman.

Copy sent to C. C. Crompton—Jackson 1-12-61.

[fol. 5712] January 9, 1961.

Fitzpatrick Electric Supply Company
444 Irwin Avenue
Muskegon, Michigan

Gentlemen:

Please refer to our Agency Agreement dated September 1, 1960, covering sales of our products by you for direct shipment to customers. This is to advise that effective for orders dated on and after December 14, 1960, the scale of commissions paid you on sales of Alcoa electrical conductors and accessories will be as follows:

Aluminum	
Bare ACSR and bare all-aluminum conductor	
(a) Sizes #6 AWG through 336,400 cm, except ACSR stranded conductors, 8/1, 12/7, and 16/19	3%
(b) Sizes larger than 336,400 cm	$.005/#
(c) ACSR stranded conductors, 8/1, 12/7, and 16/19	$.005/#
Weather-resistant line conductors	4%
Self-supporting secondary and service drop cables	4%
Accessories	5%
Copper	
Bare solid and stranded copper overhead conductors	$.005/#
Weatherproof solid and stranded overhead conductors	$.0075/#
Rome Trimline Primary Distribution Systems	5%

[fol. 5713] The change from previous commission rates of 2% to $.005 per pound effects only the bare ACSR and bare all-aluminum conductor in sizes larger than 336.4 MCM and in the following ACSR strandings: 8/1, 12/7, and 16/19.

We shall appreciate acknowledgment of your understand-

ing of this amendment by signing, dating and returning the attached duplicate copy of this letter. Our district and branch offices have been advised of this revision.

Very truly yours, Rome Cable Division of Alcoa, James G. Holloman. Fitzpatrick Electric Supply Co., By ——, ——.

Date: ——

JBH:jb

[fol. 5714] September 1, 1960.

Fitzpatrick Electric Supply Co.
444 Irwin Avenue
Muskegon, Michigan

Gentlemen:

We hereby engage Fitzpatrick Electric Supply Co. to act as Agent under the terms specified herein, in the sale of our electrical conductor and accessories for direct shipment to customers located in the following territory:

Michigan: Counties of Antrim, Benzie, Charlevoix, Cheboygan, Emmet, Grand Traverse, Kalkaska, Lake, Leelanau, Manistee, Mason, Mecosta, Missaukee, Montcalm, Muskegan, Newaygo, Oceana, Osceola, Ottawa and Wexford.

Your representatives will normally obtain the selling prices which they are authorized to quote from our branch office in Jackson, Michigan. The orders which you obtain on our behalf must be transmitted through such office and are subject to acceptance by us in Rome. Such office may also designate certain customers which are excluded from your agency.

This arrangement is non-exclusive in both directions, i.e., we are free to engage other Agents for the same purpose and you are not bound to sell bare and covered aluminum and copper overhead conductors and accessories on our behalf only and we are free to solicit and accept orders directly from these customers. Commission will apply only to orders actually secured by you.

As a matter of convenience, we will expect, in each case, to receive instructions from you as to material specified, and the terms and conditions of the customer's order. The [fol. 5715] memorandum of sale received by us from you should contain the following notation:

> "This order covers merchandise sold through us as your agent, and we assume responsibility for payment. Invoice should be rendered directly to us."

After having shipped in accordance with your instructions, we will look to you for payment since you are assuming full responsibility for such accounts, including collection and payment to the taxing authority of sales or use

taxes when applicable. In rendering our invoices to you, allowance will be made for your selling commission.

For these specific services we will pay you the following commissions on orders secured by you as Agent and accepted by us for direct shipment by us to customers:

Aluminum	
Bare ACSR and bare all-aluminum conductor	
(a) Sizes #6 AWG through 336,400 cm, any quantity	3%
(b) Sizes larger than 336,400 cm, any quantity	2%
Weather-resistant line conductors	4%
Self-supporting secondary and service drop cables	4%
Accessories	5%
Copper	
Bare solid and stranded copper overhead conductors	$.005/#
Weatherproof solid and stranded overhead conductors	$.0075/#
Rome Trimline Primary Distribution Systems	5%

You shall absolve us from all responsibility for any claims where such claims exceed our limits of responsibility as set forth under "Terms and Conditions" printed on the back of our regular "Acknowledgment of Order". There are no [fol. 5716] reasons to expect that selling of our electrical conductor and accessories will involve you in any patent suits but it is understood that we take the responsibility of protecting you in this respect.

We think the above paragraphs describe the arrangement completely but it may be well to call attention to the fact that your Agency arrangement does not include orders from you for shipment to your own stores for resale, or to any other reselling stores.

Naturally, there may be reasons for review occasionally, and we shall each feel free to call on the other for that purpose. Also, it is agreed that this letter is effective as of September 1, 1960, and may be cancelled by either party upon three months' notice.

Will you please signify your agreement by signing, dating and returning the attached duplicate signed copy of this letter.

Very truly yours, Rome Cable Corporation, F. S. Marks, Vice President, Manager of Distribution. Fitzpatrick Electric Supply Company, By George Anacher.

Date Sept. 15, 1960.

PLAINTIFF'S EXHIBIT 370

Internal Correspondence

January 23, 1961.

From: J. B. Holloman, Rome Cable Div., Rome
To: Rome Cable Div. Managers

Re: Approved Distributor List

All Alcoa consigned stocks and agency agreements have now been transferred to the Rome Cable Division. It is our intention to immediately prepare an approved distributor list which will identify Rome Cable Division's recognized distributors and the products which we expect to sell through each of these distributors. We ask your help in providing names of those distributors with which you are presently working and the Rome Division products they sell.

The attached sample sheet will indicate how we would like to have these lists prepared. If the distributor account is located within the district sales office jurisdiction, it should be so indicated. If it falls within a branch office territory, then both the district and the branch should be shown on these listings.

The code used should be self-explanatory. It is recognized that many of your distributors handle only insulated copper conductors, while others are primarily concerned with our

overhead aluminum products. All of the national chain houses, such as Graybar, Gesco, etc., sell aluminum conductors and accessories under Headquarters Agency Agreements, and the designation "A" should appear after their individual houses in these last two columns. Where there are consigned stocks of these products, the letter "C" should also appear. We have, in addition, signed Agency Agreements with certain independent supply houses, and these also should be identified by the letter "A".

[fol. 5718] We recognize that these lists may take some time to prepare; however, we would appreciate your giving this your immediate attention so that we may have them not later than February 10.

J. B. Holloman.

Pipe Line Application of Wire and Cable

Cable insulations of many types are now available; uses depend on wiring location, special conditions

R. C. GRAHAM

THE basic needs regarding cable insulations and wiring are much the same in the pipe line as in any other industry—lower costs, reduced dimensions, easier installation, improved performance, and longer life. The ways and means in achieving these needs, however, sometimes presents an entirely different problem than for other industries. Most cable manufacturers agree that pipe line service conditions are one of the severest of all cable applications. This situation requires unusually careful attention and selection of cable materials, properties, and design.

A brief consideration of the purpose of the cable insulation and its nonmetallic coverings may be helpful. The main function of the insulation or dielectric is to provide safe and durable electrical insulating value. The words "safe" and "durable" mean that it should possess adequate resistance to any deteriorating influences on its electrical insulating value that it may be exposed to during its normal life. Factors such as resistance to water and heat aging are highly desirable insulation characteristics if electrical stability is to be maintained. The resistance to other external influences such as weathering or sunlight, flame, oils, acids, alkalis, solvents and the like, may be, and usually are, provided by the insulation covering unless the inherent properties of the insulation itself preclude the need for further protection.

Primary function of the insulation covering is to provide the necessary degree of chemical or physical protection not already provided by the insulation. The insulation covering is also intended to protect the insulation from mechanical abuses incidental to operation and, principally, installation. Such coverings may be in the form of braids or sheaths (jackets), although the use of cotton braided cable coverings with their subsequent deterioration and rotting should now be a thing of the past with the modern synthetic sheathing and fibre materials available.

The Author

R. C. Graham is chief engineer for Rome Cable Corporation, Rome, New York. Since his graduation as an electrical engineer from Union College, Schenectady, New York, Graham has been associated with the wire and cable industry for more than 20 years in various technical capacities involving production, research, and product engineering and application. In his present capacity, he has been in daily contact with cable installations and problems—particularly those associated with the pipe line, petroleum and chemical industries. Graham has been a member of several government and industry committees including AIEE, IRE, PESA, IPCEA, IAEI and others. He is the author of many technical papers pertaining to wire and cable design, development, and application.

Insulating and sheathing materials to be reviewed may be classified as either thermosetting or thermoplastic. First to be considered is the thermosetting group, of which rubber or its synthetic counterpart, is probably the most familiar material.

Thermosetting Materials

Insofar as pipe line wiring jobs are concerned there are now relatively few insulating compounds that would be of special significance in spite of a multitude of trade names. The first of these is a moderately low cost, general purpose compound developed since the wartime advent of Buna S synthetic rubber and possessing the dual feature of good resistance to both heat and water—it is suitable for 75 C temperature rating and for use in wet locations. It is sometimes referred to as a combined RH and RW insulation and when used under an appropriate covering, can be safely recommended for nearly any 600 v a-c power circuit wiring application. It is especially suitable for secondaries and underground services.

Another useful but slightly higher in cost rubber insulation is the so-called oil-base ozone-resistant type of compound whose dominant constituent is a vulcanized vegetable oil. This insulation also possesses excellent heat and moisture resistant properties and may be rated at 75 C. Long experience has indicated that this high dielectric strength and corona-resistant compound may be safely used as power cable insulation up through 15 kv and possibly higher.

Butyl synthetic rubber has within recent years been introduced as cable insulation but long time performance records are not yet available. Indications are, however, that it may be recommended for similar ozone-resistant rubber compound applications. Industry specifications for such a compound recently have been established.

Performance of these rubber insulations in most applications would be short-lived if they were not protected adequately against the various exposed elements and reagents. The best known non-metallic sheathing material, Polychloroprene (Neoprene) is now almost universally accepted for this important application since it conveniently provides the desired functions of a sheath. Electrically, most Neoprene compounds are relatively poor, but their genuine toughness and resistance to abuse plus good heat, flame, and sunlight resistance, qualify their use as non-metallic protective sheaths. Neoprene is also resistant to low concentrations of chemical reagents at normal temperatures. However, principal dependence for moisture resistance must be placed on the insulation proper. Neither does Neoprene possess adequate resistance to severe gasoline or oil conditions, since it may be permeated by these fluids and associated vapors. For most general purpose wiring jobs, inside, underground or over-

Reprinted from THE PETROLEUM ENGINEER, February, 1954

[fol. 5721]

head, this material makes a good protective sheath for the rubber insulation.

The newest and, right now, the most expensive thermosetting insulation, is so-called "Silastic" or silicone rubber. This recently developed material possesses many interesting properties that will undoubtedly find certain applications in the petroleum and pipe line industry where excessive heat is a problem. Its chief virtue is its ability to operate over a very wide temperature range from —55 C to +150 C. A problem exists in finding some tough non-metallic protective covering other than a glass fiber or asbestos braid that will be able to perform over a similar temperature range. Of course, a lead sheath provides a suitable metallic covering.

Thermoplastic Materials

The best known and most widely used thermoplastic material is Polyvinyl Chloride or its copolymer with vinylacetate—let us call it PVC. This is the material that has been used as insulation on Types T and TW building wires and, so far, has consisted of a compound mixture of resin, liquid monomeric plasticizers, fillers, and pigments. PVC has so many virtues that it may serve as a combined insulation and sheath, in itself—this means simplicity, low cost, small dimensions, easy installation, etc. PVC has reasonably good electrical characteristics but its use as power cable insulation is generally limited to 600 v a-c.

It lends itself particularly well to pipe line and refinery wiring because of its inherent resistance to flame, sunlight and weather, inorganic acids, oils, and many chemical reagents—even excelling Polychloroprene in these latter respects. Many manufacturers add a factory applied surface lubricant that greatly reduces pulling tensions. Such insulated cables may be used for almost any type of indoor or conduit wiring and a few types of outdoor wiring. It is being successfully used directly in the earth by several utilities for street lighting and other applications.

A recent development in PVC compounds has been accomplished in which poly-ester type plasticizers have been substituted for the usual monomeric plasticizers, resulting in certain performance improvements of special interest to your industries, since it will mean added resistance to oil, gasoline, and other chemicals, plus increased resistance to heat and deformation.

The next thermoplastic material in popularity is Polyethylene, which is now substantially equivalent in cost to PVC. Polyethylene, a pure hydrocarbon resin (not a compound), has many advantages to qualify it for cable insulation or sheaths for the oil industry. Its electrical properties, resistance to moisture, and cold temperature characteristics are superior to any other now regularly available, non-metallic cable covering.

Being thermoplastic it is subject to appreciable heat deformation at or above its melting point of 105 C. However, there is practically no heat deformation up to 90 C, and is superior to PVC in this respect. If the circuit is to be subjected to frequent or heavy uncontrollable overloads, Polyethylene should not be used, although it is entirely satisfactory in this respect at its rated maximum temperature (75 C) or lower. Polyethylene is resistant to weather, most oils up to temperatures of 50 C and most solvents (not aromatics). Because of its remarkable moisture resistance and low permeability constant, it is an excellent choice for any d-c circuit insulation where moisture may be present.

Results of a research under way in Rome Cable Laboratory show Polyethylene to be outstanding over all other insulations when subjected to d-c moisture test. Conventional Polyethylene burns readily—but no more so than any ordinary rubber compound, so that this characteristic may or may not be objectionable. Flame-resistant Polyethylene compounds have been recently developed which will correct this property. Polyethylene is considered satisfactory for installation indoors, overhead, or in the earth. Industry specifications for Polyethylene insulated cables are now available.

Nylon thermoplastic is used either as

Pipe Line Applications of Wire and Cable
Brief suggestions for cost savings and special applications

Pumping Stations

Motors requiring a distribution voltage of 1200 are frequently required. Although not generally listed in manufacturers' catalogs, there is an IPCEA-ASTM rating classification of 2000v that would be appropriate for such wiring. Therefore, a 2000-volt rated cable consisting of ozone-resistant insulation with an outer Neoprene sheath — either as single or multiple conductor assembly is suggested.

Cathodic Protection

For underground cable connections between the electrodes and pipe line, a satisfactory and economical solution is heavy wall TW. A satisfactory alternate type is so-called type RH underground cable rated at 600 v. Either may be buried directly in the ground.

Pipe Line Telephone

A most economical and satisfactory multi-paired cable design utilizing thin walls of Polyethylene, shielding, and overall synthetic sheath has been developed for either overhead or underground application.

Pulling Compounds

For Neoprene sheathed cables a lubricant consisting of soap flakes and water has been found very effective. For TW type insulations a surface lubricant is ordinarily applied at the factory. However, paraffin or "Albany" compound serves where further lubrication may be needed. Polyethylene is practically self-lubricating — ordinary water should provide adequate lubrication for most jobs.

Direct Buried Cables

Install at least 18 in. below the ground. If unshielded, keep cables spaced a few inches in the trench and a bare counterpoise wire installed in the same trench will provide some lightning protection.

Shielded Power Cables

Where expense is considered too great, consider either conventional lead sheathed or thermoplastic jackets (instead of Neoprene) over the shield.

Large Conductors

Wherever space permits, the paralleling of conductors in good engineering and economical. One large company has reported they try to limit any maximum conductor size to 500 MCM. For example, substitution of paralleled 500 MCM Type RH conductors will provide the same current-carrying capacity as single conductor 1000 MCM type RH — at a cost saving (cable) of 25 per cent and a further substantial saving of copper.

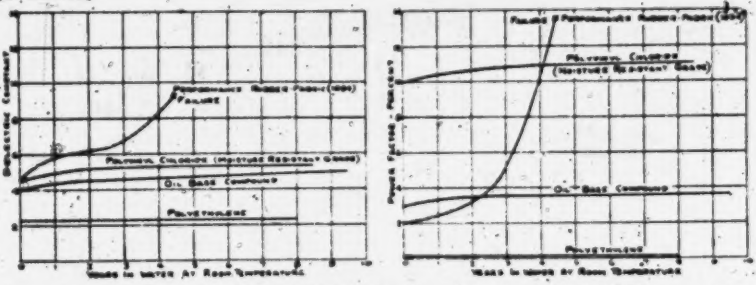
Multi versus Single Conductor Power Cable

Wherever terminal and raceway space permits, three single conductor power cables have certain technical and economic advantages over a three conductor cable. On most 600 volt sizes this means at least a 30 per cent saving in cable cost plus easier splicing, repairing, fault location, etc., for the single conductor cable which, incidentally, also incorporates full sheath protection throughout the circuit length.

Cable Specifications

Wherever possible it is recommended that standard industry specifications be followed to. Special requirements or "trick" tests usually means increased costs, restricted supply, and delivery delays.

[fol. 5722]



FIGS. 1 AND 2. LONG time electrical data describing moisture resistance of cable insulation.

an extruded sheathing material or as a fabric for braid coverings. It is relatively high in cost and its proposed end uses should be carefully reviewed before deciding upon its application. Its primary feature as a cable covering is its unusually high resistance to mechanical abrasion and crushing. So far, Nylon has not been used for primary insulation due to inherent poor electrical properties and moisture resistance.

Polytetrafluorethylene (Teflon) and flourinated ethylene (Flourothene and Kel-F) are under development as cable insulations. Although present costs are prohibitive, the anticipated advantages of these materials will undoubtedly find many applications in the future. Their almost complete resistance to all solvents, chemicals, flame, water, etc., added to their excellent electrical and heat characteristics certainly present an attractive picture for hazardous wiring jobs.

One of the major enemies of cable insulation in the past has been water and this problem has undoubtedly precluded use in many underground or wet applications. Figs. 1 and 2, however, present data on long-time tests that illustrate the progress that has been made in making our modern insulations substantially waterproof so that we can now confidently select a proper insulation without a lead sheath for wet locations.

Laboratory Testing

Our knowledge and best uses for these materials are mainly obtained from intelligent testing and development of the right kind of tests has been a problem in itself. Insofar as nonmetallic sheathed cable is concerned it has been found that resistance to moisture is probably the greatest determining factor for a successful service life. Accordingly, a large part of laboratory research over the past 15 years has been devoted to development of a suitable test to prove whether or not a cable should be used in a wet location.

It has been long since determined that it is not necessarily a question of how much water is absorbed, but of much greater significance is the location of the absorbed water in the insulation, and this can only be established by electrical test methods. A test has now been developed to determine the electrical stability of insulations in water and, recently, has been adopted as a Standard by ASTM and IPCEA.

Another somewhat new and highly useful test for cables rated at 3000 v and higher is called the corona-level test. This test serves as a vital control of quality by measuring the start of internal ionization within the cable. Since lochs insulation or shields, voids, abnormal porosity, etc., might cause destructive ionization discharge at the operating voltage, it is the object of the corona-level test to detect this condition and thus reduce another failure hazard.

Cable Design and Selection

Probably the best known design utilizes a combination having about 15 years experience and consisting of a good rubber insulation with an overall Neoprene sheath. The features of such a cable as compared for instance, with a lead sheathed cable are simplicity which aids in splicing, freedom from electrolysis, light weight, low cost, and a general-purpose end use either over-

Suggested safe practice for pipe line wiring.

FIG. 4. CONTROL cable — Polyethylene insulated, thermoplastic sheathed.

FIG. 5. AERIAL telemetering cable with factory applied messenger.

head, underground, or indoors. With modern grades of insulation such a cable is almost foolproof for most 600 v power applications. Experience has shown, however, that for certain installations involving severe oil or chemical exposure that a conventional lead sheathed or suitable thermoplastic design may be preferable.

When circuit voltages over 3000 are encountered it may be desirable to incorporate a metallic shield between the insulation and sheath for protection to personnel or to eliminate failure possibility from sheath leakage and discharge or from voltage surges. Where a shielded cable (Fig. 3) is advisable for electrical reasons and where there may be considerable exposure to oil or chemicals a more economical thermoplastic sheath instead of Neoprene is suggested. This would be especially true for buried installations near or exposed to the pipe line conditions.

For many 600 v applications especially lighting, machine wiring, branch circuits, etc., a TW or PVC insulated conductor has provided satisfactory and economical service—especially for the petrolrum and chemical industries. Recent trends indicate that slightly heavier than standard TW walls of a special heat-resistant PVC compound are being successfully used in many locations including direct earth burial. Such PVC insulated conductors are not generally recommended for power circuit applications in excess of 600 v.

Polyethylene as insulation or sheath is gaining prominence rapidly and is already being used in the chemical industry for power cable insulation on cables rated up to 15 kv. The material is also ideal for low voltage d-c control circuit wiring as illustrated in Fig. 4. It is about the only satisfactory material available for high-frequency and telephone cable insulation on non-leaded designs. In fact, multi-paired telephone cables using Polyethylene have been manufactured for installation directly in the trench with the pipe line itself. Such cables are specially constructed or custom-built for the job. Similar telephone cables can be designed for overhead use.

Overhead cable versus open-wire construction is rapidly gaining in popularity mainly because of substantially improved appearance and protection from storm outages. Aerial cable construction initially costs somewhat more than open-wire, depending upon the operating voltage, but compared with underground construction costs considerably less and offers similar advantages. Almost any type of power, control, or communication cable can be so constructed as to be adaptable for aerial construction by incorporation of built-on messengers (Fig. 5) at the cable factory or by the use of field assembled messengers.

For primary voltages up to 15 kv, aerial cable design generally consists of ozone-resistant rubber insulation with an overall corrosion-resistant shielding tape—or unshielded Neoprene jacketed designs for voltages up to 5000. For secondary 600 v construction, a simple cable design consisting either of Neoprene or Polyethylene insulated conductors wrapped around a bare neutral-messenger provides a simple, low cost arrangement. Standard hardware is available for any of these overhead designs.

Underground cable types generally utilize shielded, Neoprene or Thermoplastic sheathed, ozone-resistant rubber insulated conductors for voltages over 3000 (Fig. 3)—and either special thermoplastic or rubber insulated Neoprene jacketed type RR cable for 600 v applications. Any of these cables may be utilized directly buried in the earth.

Aluminum Conductors

The subject of aluminum conductors has been "on and off" for the past several years, depending upon metal availability and economics. For overhead applications involving weatherproof line wire or low voltage secondary distribution cables, the light weight and economic advantages of aluminum present such an attractive picture that its continued and extended use for such purposes seems assured. The only real problem has been the development of satisfactory connectors where good progress is rapidly being made.

For underground and other insulated cable applications the future of aluminum is somewhat doubtful. There are practically no technical advantages and the economics are deceiving. For example, the electrical equivalent in aluminum which is two AWG sizes larger than its copper equivalent means that where insulated cable is concerned an increased volume of insulation and coverings must be used. This added expense coupled with the necessity of larger raceways, more expensive connections, etc., may easily offset any apparent original savings in conductor metal particularly for voltages in excess of 600. Wherever space considerations are of importance, the use of aluminum may be almost prohibitive due to increased size.

Aluminum to copper connections in small branch circuit sizes of insulated conductors require special devices and skill that if not closely adhered to, might cause difficulty. The use of suitable compression type connectors on the larger feeder sizes has been satisfactorily established.

A. D. R. Fraser
R. A. Schatzel

Aluminum vs. Copper

There are three areas where Aluminum and Copper may compete in wire manufacture:

a) Bare Transmission and Overhead insulated wire inland away from the sea coast. Here aluminum because of its cost, lighter weight and, when reinforced with steel, its strength has the advantage. Aluminum for many years has become the principal metal used in high-voltage transmission, and with the solution of some joining problems, is becoming increasingly important in lower voltage applications. Because of the number of taps and connections at low voltage the cost and reliability of these when aluminum is considered is still a hindrance.

Along the sea coast, because of corrosion by salt water, copper is still favored.

b) Areas where copper and aluminum may both be used, depending on cost. These include industrial uses as in coils, as a part of transformers in wiring of industrial buildings, and underground. These are all insulated conductors. Aluminum cables are larger and require more insulation. The cost of termination is greater and in some cases corrosion is a factor. The margin in cost when installation is considered, increased cost of conduit because of size, and the greater care in termination, is not so great and only when copper is in short supply will aluminum be favored. However, here is a field of challenge and competition. There is no reason to believe aluminum will make progress, but copper will continue to be favored when available at reasonable cost because of its superior properties and reliability.

c) Areas where space is a predominate factor, and ease of working and flexibility are important. Here aluminum is at a disadvantage. The use of aluminum in a motor

requires a larger frame. Termination in a rotating machine introduces mechanical problems of major difficulty. The use of cable in city ducts for network supply of power to cities. Ducts are overcrowded and space at a premium. Aluminum would only apply in an emergency. The rewiring of commercial and public buildings. The cost of taking out old and installing new larger conduit is greater than the cost of wire. Some relief is possible with new insulations to install larger size of copper. Aluminum is not a solution. [fol. 5725] Aluminum is a supplement to copper. It will never supplant copper. Both are needed if in the next ten years we are to completely duplicate the entire electrical system of the country as it is now indicated we will.

R. A. Schatzel.

THE REASON FOR THIS REPORT

As aluminum is passing its 70th birthday, electrical applications of aluminum are moving down from overhead power lines into plants, offices, monumental buildings, and a host of utility structures. To determine how much knowledge of and interest in electrical uses of aluminum exists in the building industry—uses both for conductor and nonconductor applications—Alcoa retained the nationally known firm of Edward E. Ashley, consulting engineers. They were asked to survey current trends in aluminum utilization in the industry. This booklet is in large part based on the comprehensive report made to Alcoa by the Ashley organization.

Copyright 1958, Aluminum Company of America

[fol. 5729]

BACKGROUND

Today's ascendency of aluminum for electrical applications, as well as many others, dates from the end of World War II. During World War II, aluminum was commandeered by the United States Government, as was copper, for the most critical war needs. Both metals were in demand for non-electrical uses—aircraft, shell cases, etc. As a result, silver was taken from government storage vaults and used for bus conductors and transformer windings. At the end of the war, the silver was remelted and returned, and the battle of aluminum vs copper was resumed.

A number of aluminum applications were introduced or reviewed, and today we see aluminum either predominant or running a close second to copper in such uses as overhead transmission, primary and secondary distribution, busway systems, substation conductors, and light and heavy industrial bus runs. Many of the applications, such as aluminum lamp bases, countless small parts in telephone sets and lighting fixtures, have become commonplace. Aluminum conduit, aluminum building wire and cable, aluminum cable trays and aluminum switchgear enclosures are less conspicuous, but have met with wide acceptance—all because of one outstanding common denominator: savings in hard money.

There are two specific reasons for aluminum's rapid emergence and dominance in certain electrical fields . . . price and availability. Fig. 2 illustrates aluminum's remarkable and continuing increase in production. Since 1946, aluminum production has quadrupled, while copper has yet to reattain its World War II peak. In 1964, aluminum production exceeded that of copper for the first time. It appears likely to continue its lead by ever greater margins.

Consider the following short but essentially accurate picture of copper vs aluminum during the past 60 years: The fluctuations in the supply and demand of copper, with correspondingly violent fluctuations in price, have plagued the copper supplier and consumer alike for the better part of the twentieth century. The supply and demand of aluminum, and corresponding prices on the other hand, have been essentially stable. The reasons? Rather simple.

Copper was a well-established metal with a heritage running through many centuries. It was produced by several competing interests. Technological advances were creditable. In recent years, long-time price trends appear to be ever upward—irrespective of inflation. This is due to diminishing supplies of high grade copper ores, mainly in the United States.

The aluminum picture differs greatly from that of copper. Aluminum was a "newcomer" to the metal industry and was considered an upstart by some. Aluminum is the most common metal in the earth's crust. The rise in the use of aluminum is due to maintenance of a stable price structure and to research and developmental programs. Today's user of aluminum sees a very clear picture of abundant supply and a stable market price. Fig. 3 shows that aluminum has maintained a fairly steady rate of price change, while other metals have shown price fluctuations of considerable magnitude.

Aluminum's progress may also be linked with its inherent physical, electrical, mechanical and nuclear properties. These properties are responsible for tipping the balance to aluminum in the face of stiff competition with copper and other materials.

The following sections of this report outline the areas where aluminum electrical products have been successfully applied. It is hoped that those responsible for the design, inspection and construction of buildings may find information here which can be applied to specific applications, and which will contribute to the improvement of electrical systems in all types of structures.

THE ALCOA BUILDING ... SHOWCASE FOR ALUMINUM ELECTRICAL PRODUCTS

During 1950, the eyes of the building industry were on Pittsburgh, where the Alcoa Building—an entirely new kind of skyscraper—was under construction. From its curtain wall skin to the electrical backbone of riser bus deep within its core, the Alcoa Building was an innovation in aluminum.

This metal was utilized in every practicable application here to show its versatility and to demonstrate its major role in commercial buildings.

The Alcoa Building is a significant undertaking to all in the industry, especially to those associated with the design and installation of building electrical systems. The structure is a veritable showcase for aluminum in virtually every type of electrical component—and, a challenge to skeptics who questioned the extensive use of this metal in electrical systems.

Today, there is probably no major commercial structure in the world that has used aluminum more effectively and economically in its electrical systems. The Alcoa Building was the first skyscraper to use aluminum wiring exclusively—first to use rigid aluminum conduit exclusively—and first to use all-aluminum lighting fixtures designed as an integral part of the ceiling heating and cooling system.

In spite of outside skepticism, Alcoa felt confident this aluminum electrical system would prove its success over the years . . . and it did.

Further reference to specific electrical components in this building will be made in the appropriate sections of this report. Meanwhile, let us explore other commercial and industrial structures where aluminum electrical products are being proved practical, efficient and economical.

3 Here is one of the many aluminum recessed fluorescent fixtures in the Alcoa Building. Housing is specially designed with slots that conduct the ceiling grid of aluminum pipe to carry away heat generated by the lights.

4 This main switchboard in the first basement controls the power supply for 11 floors, two basements. All panels are made of aluminum.

5 This run of 24 4-in. aluminum conduits feeds the branch circuits in the building.

6 Feed passing 750,000 cm aluminum cable routes to bus connection for connection to 2,000,000 cm aluminum ring bus.

7 Insulated aluminum cables and terminals of the supply power to a 650-hp refrigeration compressor located in the building's sub-basement.

[fol. 5733]

ALUMINUM ELECTRICAL PRODUCTS AT WORK IN COMMERCIAL BUILDINGS

The group of buildings surveyed by the Ashley firm includes some of the nation's major commercial construction projects. In each, aluminum's lightness, easy-working properties, and electrical characteristics provided economical and efficient installations of busways, conduit and other electrical components.

It is interesting to note that many of the buildings in this group are located in New York City, an area where commercial electrical codes are probably as stringent as any in the nation. Other buildings not shown here are listed separately. In many cases, more than one building of a particular company contains aluminum electrical products.

AMERICAN MACHINE & FOUNDRY COMPANY • BELL TELEPHONE COMPANY • CHRYSLER CORPORATION • DIPLOMAT HOTEL, MIAMI, FLA. • E. I. DU PONT DE NEMOURS • FORD MOTOR COMPANY GENERAL MOTORS CORPORATION • HALLMARK CARDS • ILLINOIS INST. INDUSTRIAL BUILDINGS AND SPECIAL INSTALLATIONS

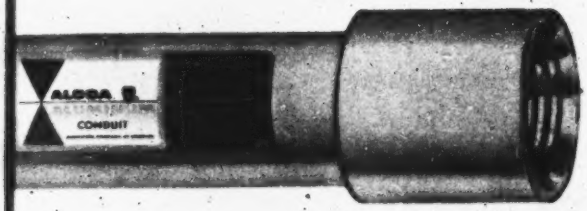
As a rule, construction materials for industrial buildings and other special structures are exposed to a greater degree of abuse than those found in commercial buildings. Many process industries and fabricating plants, for example, have atmospheres which are inherently corrosive, dusty or humid.

Most of the aluminum electrical products we know today grew up in such environments . . . areas where other metals might have failed. Aluminum resists corrosive acid fumes in chemical and sewage disposal plants, shrugs off the effects of steam and moisture in dairies and other areas of high humidity. And outside, on bridges, in substations . . . even on the undersides of buses and highway trailers . . . aluminum comes through in all types of weather like the proverbial postman. Small wonder, then, that aluminum electrical components were selected for the installations shown here and for those on the previous page.

Now that we have seen where aluminum electrical systems are at work, let us examine each component in the system more closely. Let's look at *facts*.

5735]



ALUMINUM CONDUIT

Alcoa aluminum has had approval of Underwriters' Laboratories, Inc., for use as rigid conduit since 1922. Development of new alloys over the years has permitted manufacture by an extrusion process, resulting in an improved product at lower cost, with ample strength for use as an electrical raceway.

Because of aluminum's lightness, conduit installation costs in many applications are less than those for steel. Size for size, a piece of steel conduit is nearly three times as heavy as a similar piece in aluminum. Lighter weight permits more rapid installation, helps reduce worker fatigue, and is a decided benefit in hazardous or difficult situations where very high ceilings or high vertical exterior risers are encountered. Fig. 1 shows the comparative weights of aluminum and steel conduit feeders.

For a large group of feeders in conduit, the number of required supports will generally be proportional to the weight. Here, very definite installation savings can accrue from an aluminum conduit installation. Fig. 2 compares the support requirements of large-size aluminum and steel conduits, showing that fewer supports are necessary with aluminum.

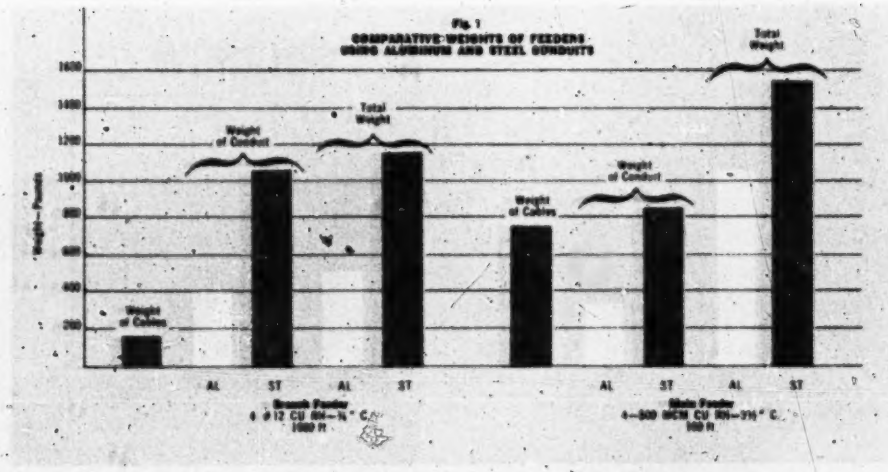
To compare the installation requirements of steel and aluminum conduit, a set of figures was secured representing average installation man-hours per 100 ft, in diameter sizes from ½ in. to 4 in. These figures are based on a typical project and were verified with several large electrical contractors before publication. The results can be seen in Fig. 3.

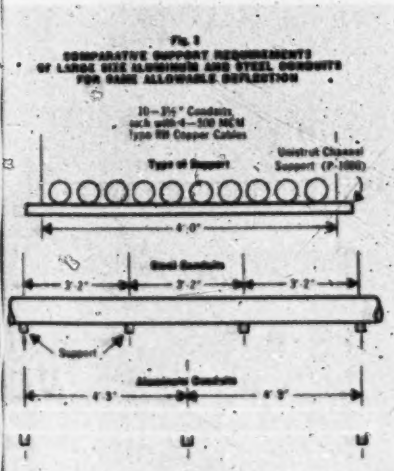
The "possible" line in this graph was derived from a poll of several hundred leading electrical contractors across the nation who felt that the installation time shown could be achieved by using experienced and knowledgeable mechanics. Most contractors polled, who had worked with aluminum conduit, stated they had realized appreciable installation savings. The average savings ran about 10 to 15 per cent, but some contractors indicated savings of as much as 20 to 40 per cent.

Aluminum wards off most corrosive elements that damage other types of metallic conduit. Ample proof of aluminum's resistance to corrosion has been cited in numerous exposure and laboratory tests, and by countless applications in the process industries.

Aluminum conduit can be safely installed in concrete. This is proved by the successful use of aluminum for handrails, grilles, structural elements, building facing, terrazzo strips and pipes. These can be completely buried in concrete or may be partially covered. The latter condition is more often subject to corrosive attack than the complete burial.

[fol. 3736]

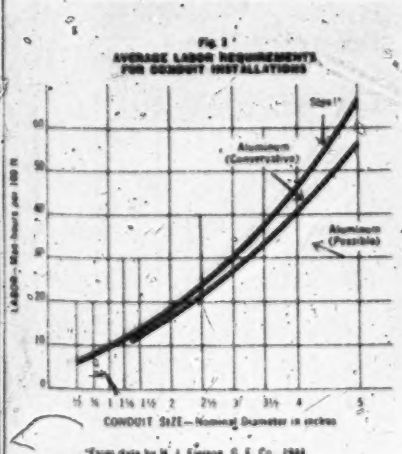


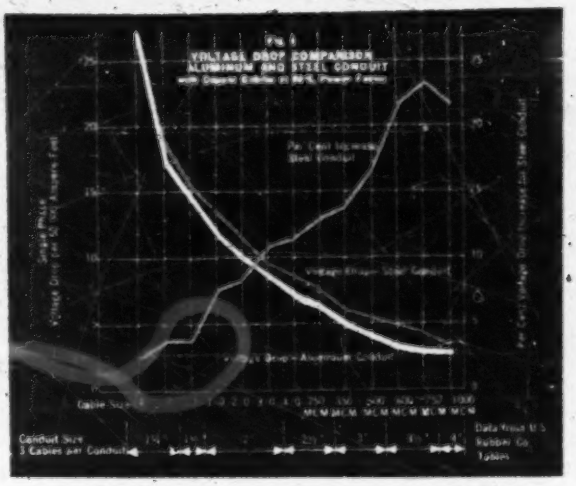


Extensive testing also leads to the general conclusion that aluminum is compatible with the common alkaline building materials. The chemical by-products and hydroxides of calcium, magnesium and ammonium in building products cause an initial mild surface attack which upon subsequent curing and aging develops into a self-limiting protective film, thus preventing further corrosive action.

Since aluminum is nonmagnetic, it is not subject to magnetically induced energy losses. Therefore, voltage drop is reduced, and each conductor in a single-phase or polyphase system can be enclosed in a separate conduit, regardless of the electrical load. Installation of electrical equipment with widely spread terminals is thus simplified. Fig. 4 compares voltage drop for the common range of copper cable sizes in aluminum and steel conduits. It can be seen here that feeders in aluminum conduit have a lower voltage drop throughout the entire range of cable sizes.

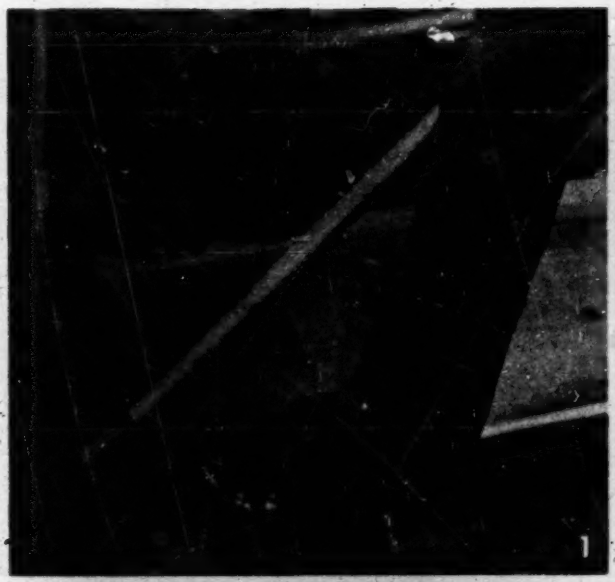
Other advantages of aluminum conduit over that of steel include a nonsparking property that is particularly important in explosive environments, and a handsome appearance that counts heavily in areas where a modern, clean-looking installation is desired.

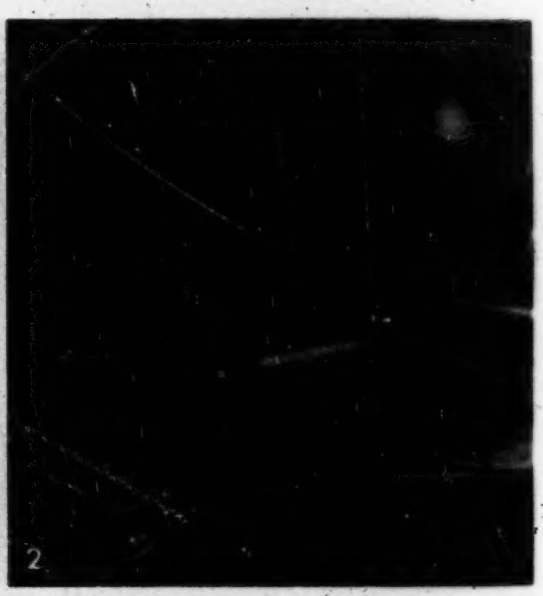




[fol. 5737]

WORKING PROPERTIES OF ALUMINUM CONDUIT





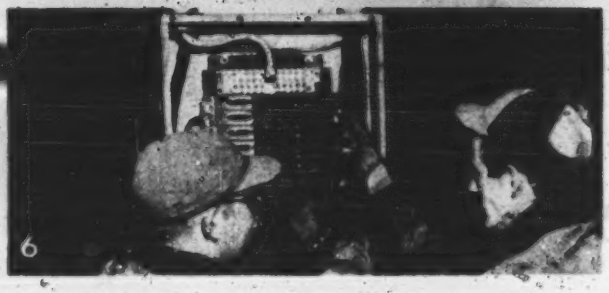
[fol. 5738]

1-2. BENDING

Aluminum conduit is far easier to bend than conventional conduit, as less force is required for a comparable bend. Bends can be made "on the nose," since there is no appreciable springiness, as in steel. Most contractors use the same bending tools for steel and aluminum conduit, with equally good results. EMT benders can be used for the smaller conduit sizes, while rigid conduit benders are excellent for the larger sizes.

3. CUTTING

Aluminum conduit is easier to cut than steel conduit. The smaller sizes are easily cut with a hacksaw, while modern power cut-off equipment can be used for the larger sizes.

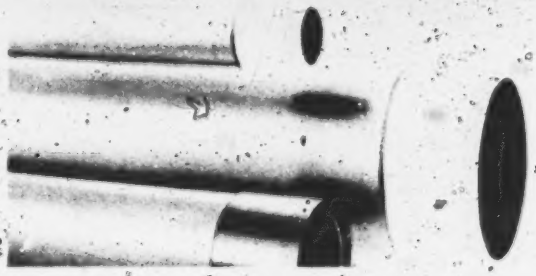


4. THREADING

Aluminum conduit is easily threaded if good conventional tools are used; but the use of dull tools or broken dies may cause serious difficulties. The use of sharp dies is good practice with aluminum as with any other metal. If desired, dies can be purchased with a rake of about 35 degrees to make them self-cleaning. Almost any conventional cutting oil can be used, although the better grade oils have a viscosity of approximately 150 ssu at 100 F and are fortified with sulfur and/or chlorine additives.

5. JOINING

Again, the same practices apply to aluminum as to steel. A typical thread lubricant consists of a mixture of zinc dust and petroleum jelly, or a heavy cup grease containing about 25 per cent graphite.



6. WIREPULLING

A special coating which is provided on the interior walls of Alcoa aluminum conduit makes wirepulling exceptionally easy. Terminal balls should be used on the ends of fish tapes to prevent sharp tape ends from digging into the conduit at bends, or catching on inadequately closed joints. If additional lubrication is required, as occasionally happens, talc or powdered soapstone is recommended. Some difficulties have been reported here and there because of failure to follow these practices.

7. STORING

Alcoa aluminum conduit is supplied with improved protective caps for threaded ends. Caps are color coded to provide fast size identification, simplifying conduit storage and handling.

[fol. 5739]

TYPICAL ALUMINUM CONDUIT INSTALLATIONS

THE ALCOA BUILDING, PITTSBURGH, PA.

It would seem appropriate that Alcoa's home headquarters should have made extensive use of aluminum. Yet, the selection of this metal reflected more than a manufacturer's natural preference for his own product. This is especially true of the aluminum conduit installation in the building, where aluminum was selected over steel because of installation and maintenance economies. The electrical contractor for the project reported installation savings were especially marked for conduit 1½ in. and up. He compares the aluminum conduit with steel as follows:

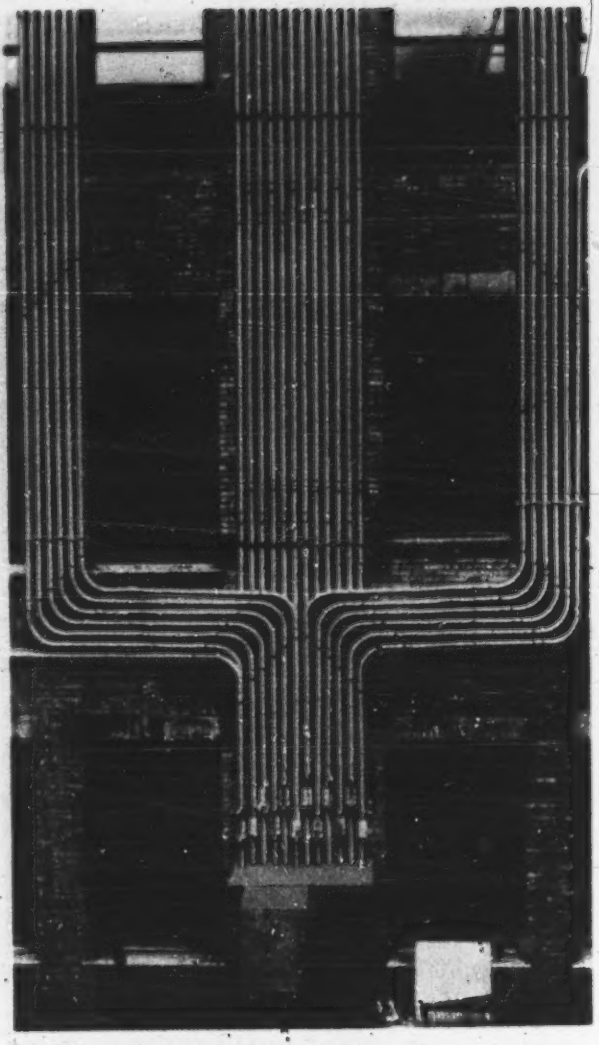
Cutting	"Same"	*Bending*	"Easier"
Threading	"Same"	*Installing*	"Tremendously easier"

[fol. 5749]

EBASCO SERVICES BUILDING, NEW YORK, N. Y.

Here's an interesting and instructive aluminum conduit installation erected early in 1955, and in full service today. It consists of several 2½-in. conduit risers running up the exterior wall of this 26-story building. Aluminum conduit was considered ideal for this project because it was desired to utilize existing shutter brackets as supports. Steel conduit would have been too heavy and too difficult to maintain.

Even though this installation had to be made from two simultaneously rigged painter's scaffolds, the advantages offered by light weight, easy-handling aluminum sections made it possible for the contractor to make substantial savings.



The unqualified success of the initial job prompted the installation of additional 2½-in. risers two years later. The contractor prepared two estimates for the addition—$13,500 for steel, and $12,150 for aluminum conduit—or a 10 per cent saving with aluminum. Fig. 5 graphically shows these comparative estimates.

This particular project illustrates an excellent and economical way to increase the electrical capacity of large, inadequately wired older buildings, especially where inner shaft space is lacking, and where it is inconvenient and costly to break through multiple floor slabs. This situation is becoming more common with ever-increasing air-conditioning and lighting demands on major office buildings.

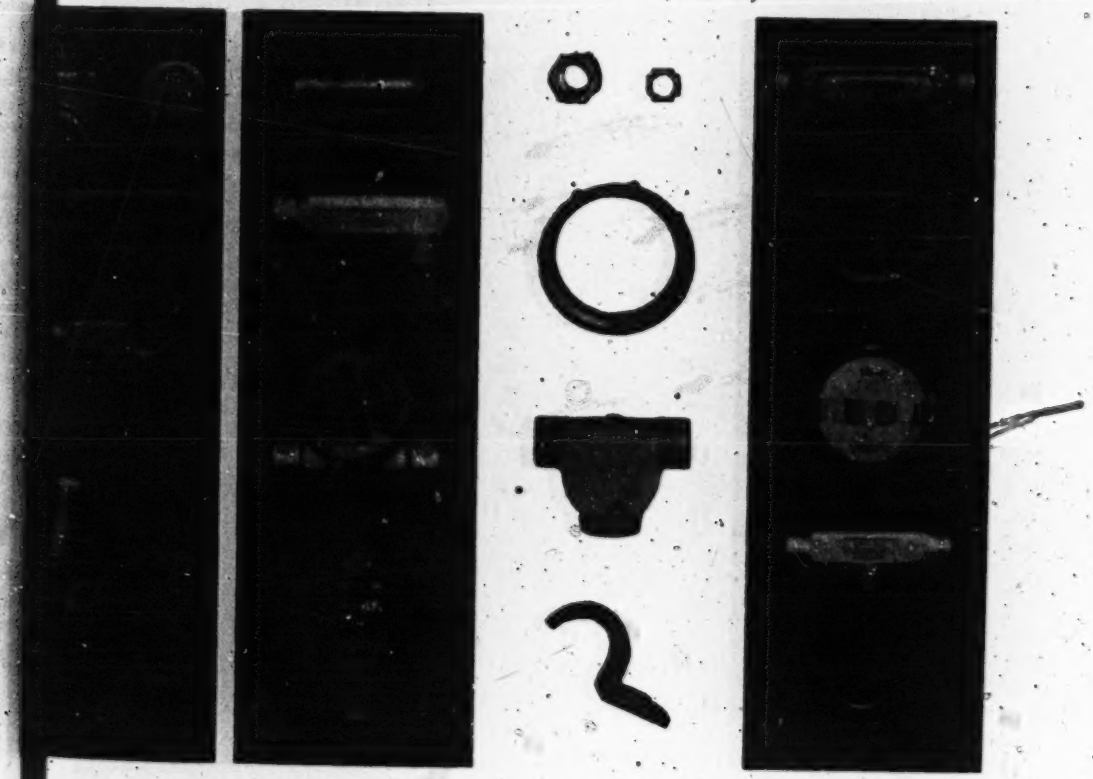
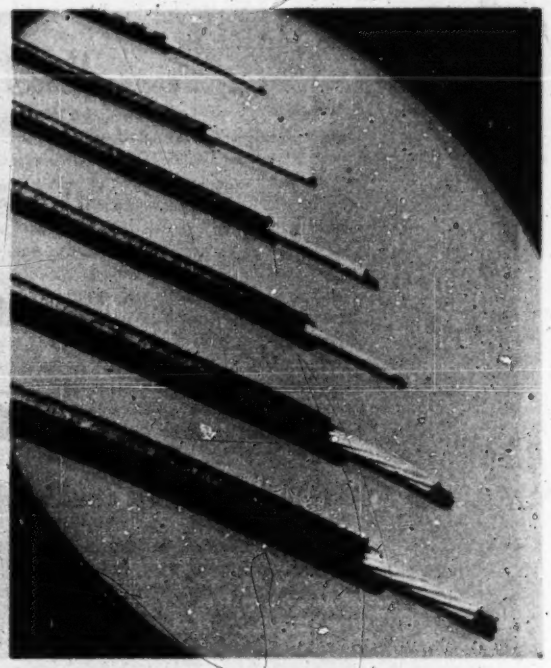
CONDUIT FITTINGS

Shown here is a selection of aluminum fittings made by several manufacturers. One major manufacturer now produces virtually every item in his catalog in aluminum as well as cast iron. Another produces his entire line of fittings, receptacles and fixtures in aluminum only. Moreover, in most cases, there is no premium for aluminum fittings.



[Vol. 5744]

ALUMINUM WIRE AND CABLE



Aluminum cable dates back to the turn of the century, when it was first used in transmission and distribution lines. There it proved its reliability under electrical, corrosive and mechanical conditions far more extreme than encountered in typical office or industrial installations.

In more recent years, insulated aluminum wire and cable have appeared in commercial and industrial buildings, where they again performed satisfactorily under all types of conditions. Aluminum branch wiring, for example, has been particularly applicable and economical in office buildings utilizing 277/480 volt distribution and lighting systems. Viewed on a historical basis, the increased use of these aluminum electrical conductors can be attributed to a favorable price situation.

A comparison of weight and current-carrying capacity of copper and aluminum cable in conduit is seen in Fig. 1. Here, a 3-cable feeder is plotted as a function of load in both aluminum and steel conduit.

For practical purposes, an aluminum wire is considered to have a rated current capacity approximately the same as a copper wire two gages smaller (that is, No. 8 aluminum is the same as No. 10 copper wire). Fig. 2 shows that the allowable current-carrying capacities recommended by the National Electrical Code are nearly a linear function of the conductor diameter.

[fol. 5745]

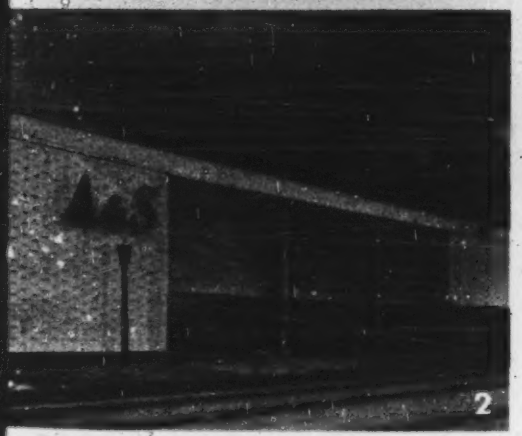
ALUMINUM WIRE AND CABLE INSTALLATIONS

1

1. ALCOA BUILDING, PITTSBURGH, PA.

At Alcoa's home headquarters can be found one of the most notable examples of aluminum branch circuit wiring installations in recent years.

There are several interesting features worth noting in this project. Branch wiring is in No. 12 aluminum connected to No. 16 copper fixture leads. The connectors are the *bare copper alloy* type. This type of installation proves conclusively that copper and aluminum can be successfully combined in a commercial installation, and that a simple connecting method is practicable. The building's chief maintenance engineer (a registered electrical engineer) indicates that this type of connection has fully justified itself in service, and that it is the present splicing method used when changes in the system are desired.



2

2. ABRAHAM & STRAUS DEPARTMENT STORE, LONG ISLAND, N. Y.

Here's another interesting installation . . . this time with aluminum cable in *steel* conduit. The electrical system had originally been designed for copper cables, but the shortage of copper during the Korean War forced the substitution of aluminum.

Although the conduit (specified for copper cables) had already been installed, it was found possible to switch to aluminum cable of nearly equivalent capacity. A small supply of copper cable was already on hand, and some feeders were installed with aluminum phase wires and copper neutrals, others with copper phase wires and aluminum neutrals. Connectors and terminal lugs are bolted types, made of plated, cast copper alloy. The maintenance engineers regard the electrical system with great satisfaction and a certain pride in its uniqueness.

46]

FORGING PLANT, CLEVELAND, OHIO

oice of aluminum wire and cable here was rictly on the basis of competitive bids. The m conductor quotation for the entire job ut 4 per cent lower than that for copper ors. Most of the large, low-voltage feeders n as open wiring in lightweight aluminum roughs. Installation was completed in 1953.

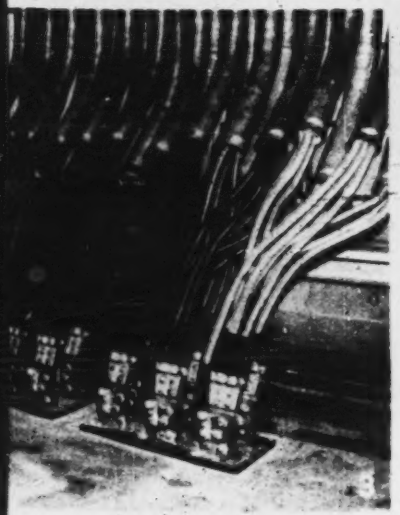
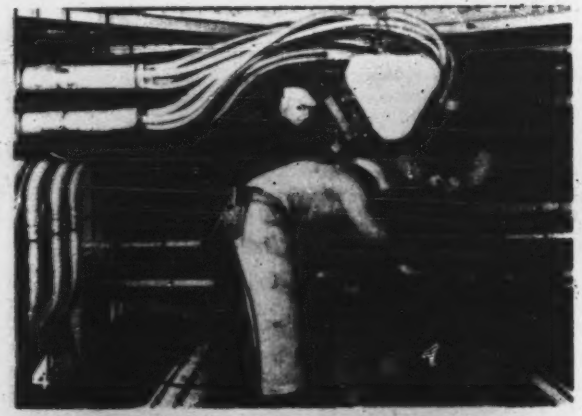
ge mill features one of the first all-aluminum tion systems in the nation. In addition to m bus, over 1,800 miles of aluminum wire ble was installed in sizes from No. 12 to cm.

l circuits from transformers consist of 1,000 d 1,250 mcm stranded aluminum cable with insulation and neoprene jacket. To avoid e due to earth settlement, the standard of using Transite ducts encased in concrete carded in favor of the use of aluminum

rs from the main bus to remote areas are ble (one or more 1,000 mcm aluminum Aluminum conduits with aluminum cables the motors, switchgear and generators to us. Typical crane feeders from the catwalk consist of aluminum cable in aluminum that pass through the catwalk floor.

he electrical contractor on the project, with aluminum was a new experience. How- reports his electricians found aluminum d cable easier to handle and to work with. pper.





[fol. 5747]

WORKING WITH ALUMINUM WIRE AND CABLE

Making a loop or hook on the end of an aluminum wire is easily accomplished by the use of round nose pliers.

Portable welding equipment is often used to attach aluminum cable to lugs and terminals. This type of termination ensures excellent physical and electrical contact.

Typical bolted and compression aluminum fittings.

PULLING THROUGH CONDUIT

A recent poll of electrical contractors with aluminum cable experience indicated that well over half considered it unnecessary to take additional precautions when pulling aluminum cables: Pulling tensions for the electrical installation in the Kitimat, British Columbia, power plant of Aluminum Company of Canada, Ltd., were 10,000 psi, the customary limit for copper. Wire temper was three-quarter hard.

SPLICING AND TERMINATING

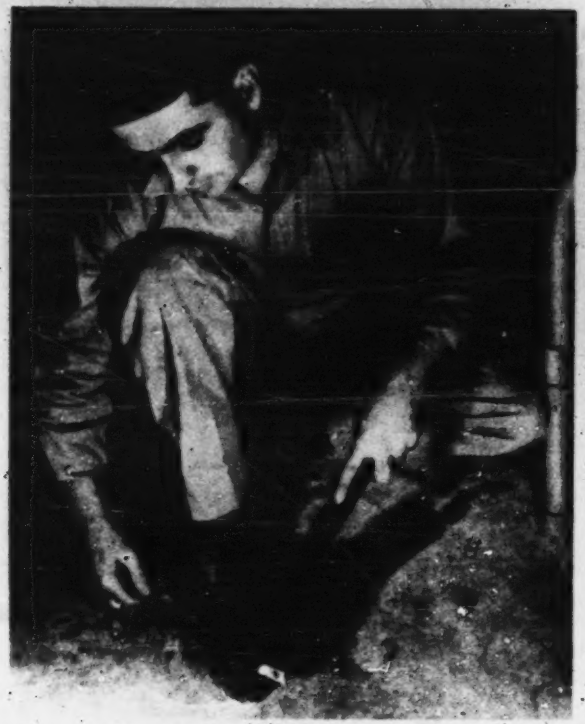
Insulation should be stripped from the ends of an aluminum wire or cable by "paring off," as shown here, instead of "ringing." Round nose pliers should be used whenever bending the end of the wire into a loop or hook.

Aluminum cables can be spliced or terminated by the use of compression fittings, mechanical fittings, welding or soldering, as shown here. For mechanical fittings, a coating of compound, such as Alcoa No. 2 Joint Compound, should be used to assist cleaning and to prevent oxide reformation on the abraded aluminum surface.

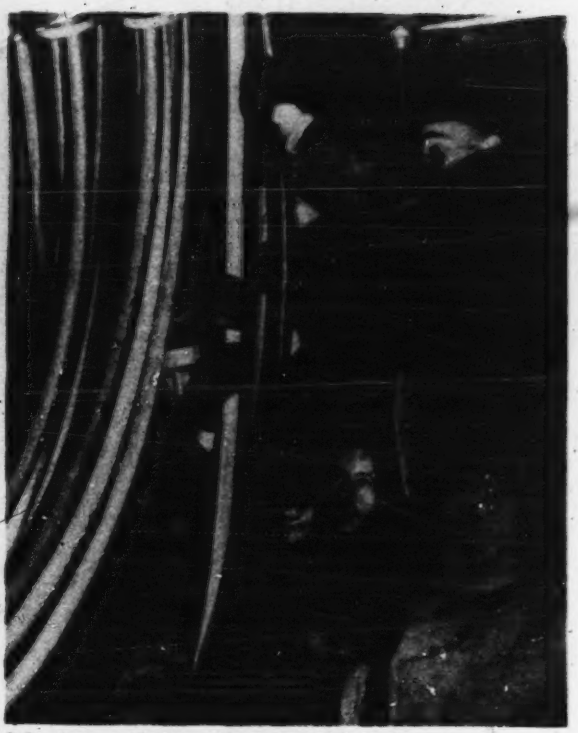
The results of extensive research and development work have shown that it is better to use fittings of aluminum on aluminum conductors than fittings of other metals. However, satisfactory test results have been obtained with some types of tin-plated copper alloy bolted fittings when tested either with aluminum cable with relatively soft strands or with a suitable joint compound properly applied, or both. A large variety of compression-type fittings of aluminum are available. They have shown very satisfactory service in industrial plants and commercial buildings. These fittings are of high conductivity metal, electrical conductor grade or similar, and of fully annealed temper.

[fol. 5748]

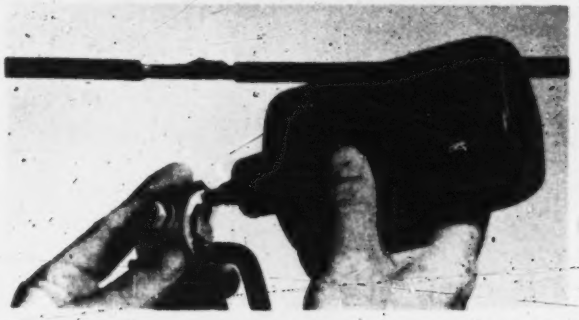
The proper method of removing insulation from aluminum cable is shown here. Insulation is pared off with a regular knife.



Compression fittings are one of the most popular methods of terminating aluminum cable. Physical and electrical contact is secure and positive.



Pulling aluminum cables through conduit is accomplished by the same methods as for other types of cable.



Use of Alcoa No. 2 Joint Compound assures good electrical contact. A long tip on the handy plastic squeeze bottle can be inserted inside mechanical fittings for fast, clean application.

[5749]

ALUMINUM BUS CONDUCTOR

Bus conductor was one of the first major uses of aluminum. The excellent physical and electrical properties of aluminum in this application were recognized from the very beginning.

In 1895, a large quantity of flat aluminum bar was used for a 20,000-amp installation at Alcoa's Niagara Falls, N. Y., smelting plant. Three years later this plant was remodeled and the bus bar remained in service until 1949, when the plant was retired. This type of conductor was standard, thereafter, in aluminum smelting plants for connecting dc conversion equipment and for pot-room feeders.

Later, aluminum bus came into use in chemical plants where corrosive attack was especially severe. It appeared in telephone exchanges during the 30's. It carried power in steel rolling mills even before then. A bus system installed in 1929 in the American Rolling Mill Company, Middletown, Ohio, is still in operation.

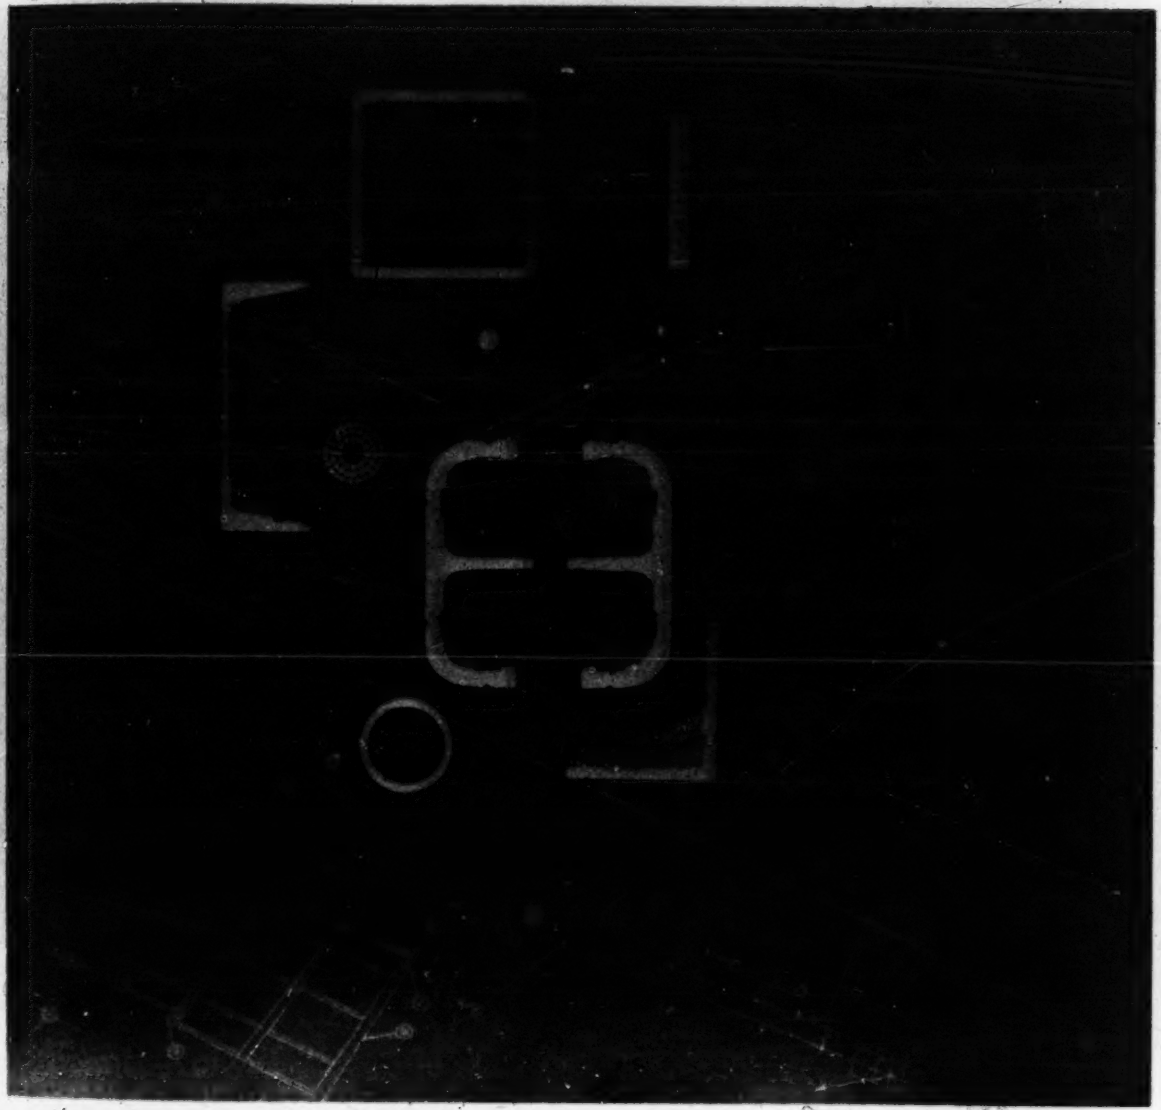
One of the first aluminum bus risers was put into service in 1930 to supply power to the Marshall Field Office Building in Chicago. It extended from the basement to the 45th floor and was fabricated from channels over 60 feet long.

An extruded aluminum sector bus serves as the vertical riser for the Alcoa Building in Pittsburgh. This same type, installed horizontally, provides a convenient power tap-off source in Alcoa's Davenport, Iowa, plant.

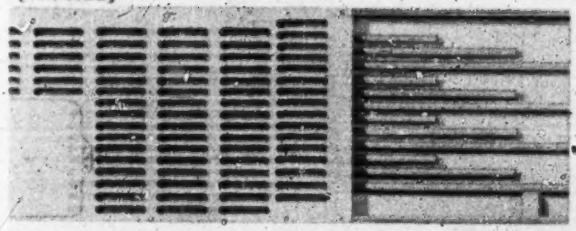
Today aluminum bus is replacing copper conductors and is the accepted standard with many in the industry. It is essentially the electrical equivalent of copper conductor bus at lower cost, providing the same load capacity as copper at about the same voltage drop, and offering significant weight saving advantages. Because an aluminum bus conductor has a slightly larger area than its copper equivalent, it can dissipate heat more efficiently. Aluminum can be silver plated for applications where silver-plated copper joints are the standard for the manufacturer.

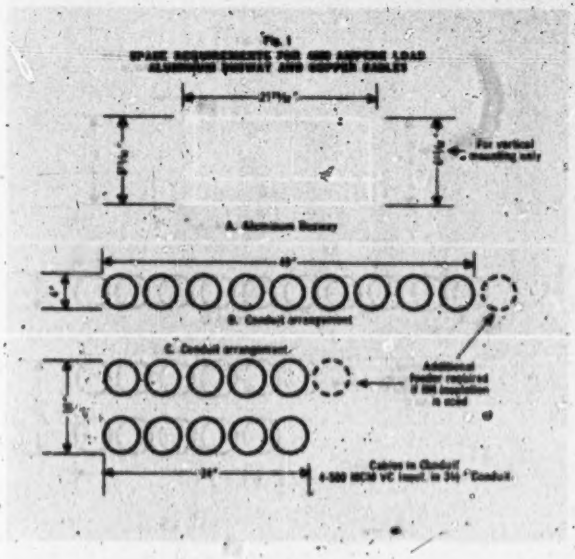
Shown here are some of the more widely known types of aluminum bus conductors including flat bus bar, square bus, integral web bus, structural bus, tubular bus and stranded conductor bus. Applications of these types in commercial and industrial busway systems are illustrated in the last part of this section. Special and unique conductor shapes can be easily extruded in aluminum if peculiar requirements exist in special applications.

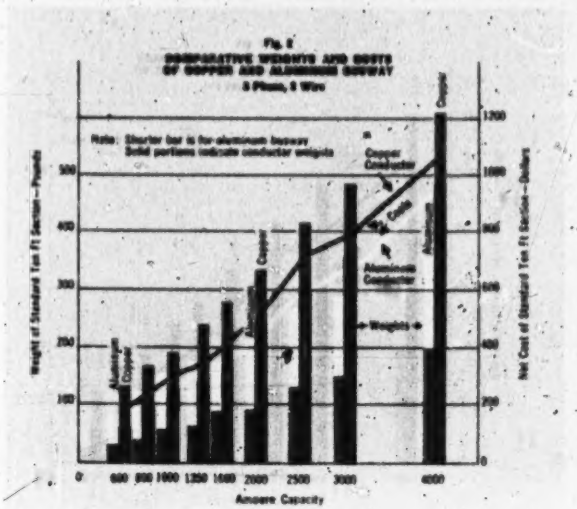
[fol. 5750]



[fol. 5751]







ALUMINUM BUSWAY

Aluminum busway is a popular commercial adaptation of bus bar. It is relatively new in the commercial market compared with traditional copper cable and copper bus. Its emergence as a practical and economical product is evidenced by its wide use in many of today's largest commercial buildings.

There are several reasons for recommending aluminum busway riser systems in preference to the older, more conventional cable and conduit systems.

Such risers are more compact than their cable and conduit electrical equivalents. Fig. 1 compares the minimum space requirements for a 4,000-amp load carried by aluminum bus and copper cables.

An aluminum busway has greater current-carrying capacity for a combination of loads than other systems. Considerable economies can be realized by combining loads with different peak times on the same feeder.

An aluminum busway riser saves switchboard room space. In effect, the busway, with its tap-offs, *is* the switchboard. Once a riser of adequate size, including spare capacity, has been installed, future loads may be tapped-off at any point along its length with a minimum of time and trouble. This flexibility is of great importance in commercial buildings where new tenant requirements or new machines may suddenly demand large increases of power at any one of a number of floors.

For busway applications, it is customary to silver-plate aluminum conductors the same as copper. An aluminum busway system weighs one-fourth as much as an equivalent copper cable and steel conduit system. This factor alone contributes to lower installation costs because the busway is easier to handle and installers can work more efficiently. Weight comparisons are shown in Fig. 2.

Relative costs for an aluminum and copper busway installation are shown in Fig. 3. Only relative values are shown because conditions and practices vary from job to job, depending on size of installation, working conditions, and a vertical or horizontal run. In general, it can be noted that installation savings will run about 25 per cent lower on most aluminum busway projects, as compared to those with copper of the same ampere rating.

Fig. 3 also indicates a 50 per cent greater installation cost, going from 600 to 800-amp copper bus, while these costs remain the same for the same capacity aluminum bus.

Fig. 4 compares the costs of a recently completed office building installation in New York City. Here, a complete material and installation cost breakdown for specific sizes and lengths of wire and cable is presented.

ALUMINUM BUSWAY INSTALLATIONS

SOCONY-MOBIL BUILDING, NEW YORK, N. Y.

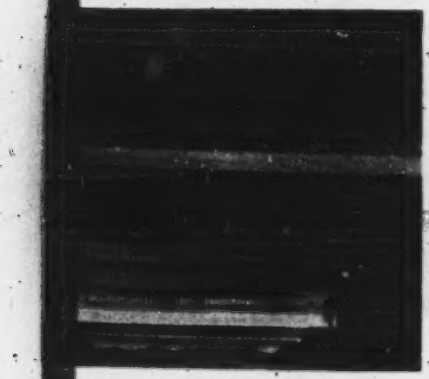
Practically all new office buildings are being designed today with an aluminum electrical backbone capable of supporting foreseeable future loads. A good example is the Socony-Mobil Building in New York.

Into this vast air-conditioned structure have been built eight 4,000-amp aluminum busways rising in two groups from basement to the 42nd floor. Four of these are 3-phase, 3-wire; and four are 3-phase, 4-wire, with full neutral. Two of the former type terminate on the 14th floor, and the remaining six extend to the 42nd floor.

Fig. 5 indicates the total linear footage and weight of aluminum bus actually installed as compared to the copper equivalent. Estimates submitted by other contractors were in line with those shown here.

Aluminum conductor busway was favored for this installation because of its lower voltage drop, a most important factor where long runs occur, as they do here. The longest busway run in the Socony-Mobil Building is about 700 feet. Over this length, the aluminum bus carries its full rated load at 86.6 per cent power factor (30-degree lagging load) with a drop of 3.50 per cent of source voltage. Copper busway with the same load would incur a voltage drop of 4.92 per cent, or 18 per cent greater than aluminum.

To match the performance of the aluminum busway with copper cable here would require twelve 3½-in. conduits, each carrying four 500 mcm cables. A comparison of estimated material and installation costs for each system is illustrated in Fig. 6. It can be seen that a copper cable and steel conduit installation would be more than four times as heavy as the equivalent aluminum conductor busway. For a 700-ft riser, the difference comes to about 110,000 pounds, or nearly an additional ton per floor.



E STATE BUILDING, NEW YORK, N. Y.

...een air-conditioning loads are making pres-...ectrical systems inadequate. The world's ... building solved this problem by installing a ...mp, 3-phase, 4-conductor, 265/460-volt alu-... busway system and a 4,000-amp, 3-phase, ...uctor, 460-volt aluminum busway system.

NEW YORK COLISEUM, NEW YORK, N. Y.

This 26-story office building has one of the first major installations of a higher voltage distribution system (480Y/277 volts). More than 2½ miles of busway incorporating aluminum conductors was used to feed power to this huge structure. The higher voltage system provides greater capacity and flexibility than conventional systems. Yet it requires only half as many, or half as large, risers and feeders. The use of lightweight aluminum busway sections made the installation easier and faster.

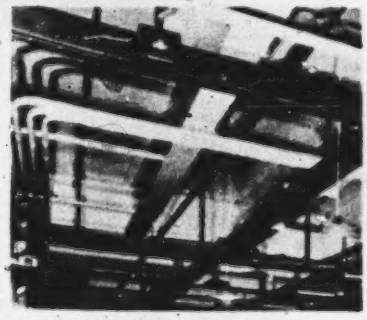
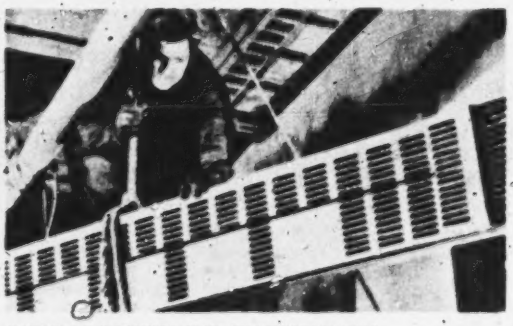
FOR CONDUITS AND CABLES VS BUSWAYS

	One Conduit with Cables	Twelve Conduits with Cables	Aluminum Conductor Busway	Copper Conductor Busway
Material cost per ft.	$ 9.37	$100.00	$112.50	$135.00
Installation costs per ft	2.50	42.00	7.50	10.00
Total costs	11.87	142.00	120.00	145.00
Ratio of costs to Aluminum Busway		1.18	1.00	1.21
Weight, pounds per 10 ft. Section		7,064	500	820
Ratio of weight to Aluminum Busway		4.14	1.00	1.64



FORD MOTOR COMPANY PLANT, SAN JOSE, CALIF.

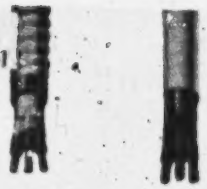
Since 1951, over 1,500,000 pounds of aluminum busway have been installed in various Ford plants. Use of this conductor in Ford's San Jose plant made a neat, safe, flexible installation that brought power to the job in any amount, at any location. Standard fittings, tools and methods of installation were employed.



CHRYSLER CORPORATION STAMPING PLANT, TWINSBURG, OHIO

The entire plant is covered with a network of aluminum busways. Light-duty, 50-amp plug-in busways serve the fluorescent lighting load. Plug-in busways, with ratings from 400 to 600 amp, braced for a 50,000-amp short-circuit current, serve the motor loads and general factory requirements. For heavy welding loads, 1,000-amp, low voltage drop, plug-in aluminum busways are used.

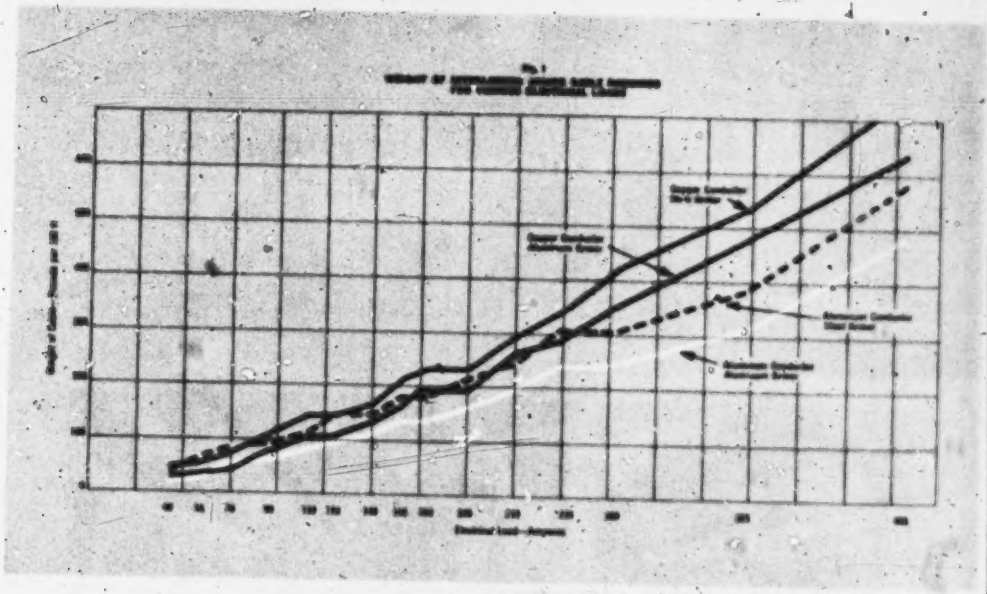
[fol. 3755]



ARMORED CABLES

INTERLOCKED ARMORED CABLE

This type of conductor is appearing more and more in industrial and power plant installations. It consists of an aluminum or copper conductor in steel or aluminum armor. The metallic exterior, or armor, is spiral-wound with successive interlocked convolutions. Armor and conductor materials may be combined in four commercially available types of cable—copper conductor in steel or aluminum armor, and aluminum conductor in steel or aluminum armor.



Interlocked armored cables have certain advantages over the common cable and conduit combination, especially for long open runs of considerable capacity where several cables may be carried in a single rack support.

Installation cost estimates of armored cable manufacturers and those quoted by electrical contractors have varied widely. Even so, the total cost of a copper cable installation in the more popular circular mill sizes would be 15 per cent to 20 per cent greater than for an equivalent aluminum cable installation.

Fig. 1 shows the weight of 3-conductor armored cables in the various combinations of copper, aluminum and steel for various electrical loads. The obvious advantage of aluminum's lighter weight and its attendant lower installation costs is a prime consideration. Weight savings run from about 20 lb per 100 ft for 3-conductor No. 6 wire to about 100 lb per 100 ft for 3-conductor 750 mcm cable. The same relationship holds true for other sizes of cables. This significant weight advantage reduces shipping costs, permits longer pulls and reduces the number of supports required.

Cable support systems for this type usually consist of troughs, racks, baskets or trays made of lightweight members, with bottoms of expanded metal plate or spaced rungs. Aluminum support systems are considerably easier to install than those made from other metals. They require no maintenance and have a practically unimpaired salvage value.

[fol. 5756]

The flexibility of aluminum-sheathed cables is demonstrated by this installation at the California Packing Corporation, Richmond, Calif. Notice how the cables may be twisted into right angle turns as they leave the cable tray. The use of clamps and trays makes installation of this type of conductor fast and convenient.

An aluminum interlocked cable at the same mill carries 12,000 volts from the secondary of the transformer at bottom right to switchgear at left.

Nine 500 mcm all-aluminum interlocked armored cables feed 2,300 volts into this switchgear at Alcoa's Davenport, Iowa, foil mill.

ALUMINUM-SHEATHED CABLE

Another product, relatively new on the building scene, that shows great promise is aluminum-sheathed cable. This type of conductor can eliminate conduits and other types of cable-carrying systems. Its flexibility and small diameter permit installation in areas inaccessible or difficult for typical conduit installations, and provide more economical use of limited space. The smooth, seamless sheath reduces the collection of electrolyte and moisture, and makes the cable impervious to insulation attacks by liquids and gases. Aluminum-sheathed cable has high tensile strength and rigidity, yet is easily bent with standard tools. It is mechanically strong and has excellent flame-resistant properties.

A tremendous market potential exists for this type of conductor, not only in control cable but in power and high-voltage applications as well. New developments in applying aluminum in this field will undoubtedly open up these markets, especially because of basic weight and cost savings over lead.

[fol. 5757] 2574

SHEET METAL ENCLOSURES, LARGE SWITCH ENCLOSURES, SWITCHGEAR

This power center controls pumps, compressors, generators, precipitators and other associated machinery in a large commercial building. Bus bars, terminals and complete housing are made of aluminum.

An all-aluminum, 480-volt switchgear unit is shown here. Main bus is rated at 1,600 amp, braced to withstand a 75,000-amp short circuit.

There are other electrical products for the building industry where aluminum offers distinct technical and installation advantages. In some instances, aluminum's physical properties strongly influence its choice over other metals.

Aluminum sheet metal enclosures, for example, have much lower induced electrical losses than ferrous enclosures, and better appearance and higher heat conductivity than their steel counterparts. In addition, they are lighter, much more corrosion resistant, and offer correspondingly reduced maintenance costs.

The use of an aluminum enclosure instead of a steel enclosure will enable a given size of switch to safely carry a greater load. For one thing, steel enclosures have appreciable magnetic losses. Another important factor is that aluminum, because of its higher thermal conductivity, dissipates heat four times better than steel.

Fig. 1 shows the cost estimates for a service entrance switch in an office building. The switch is rated at 6,000 amp, 2-phase, 4-wire in both aluminum and steel enclosures. Included in this cost estimate are the capitalized cost of the energy losses and costs for air conditioning required to remove additional heat generated by the switch in the steel enclosure.

The cost of the additional energy loss accruing to the steel enclosure should be considered when purchasing a service entrance switch of this size. In addition to the savings shown in Fig. 1, installation costs should be slightly lower for the aluminum enclosure because of its lighter weight. Fig. 1 also shows that a service switch in an aluminum enclosure may effect savings upwards of 20 per cent over a similar switch in a steel enclosure.

Fig. 1
COST OF 6,000-AMPERE SWITCH FOR OFFICE BUILDING

	Steel Enclosure	Aluminum Enclosure
Net Purchase Cost	$4,380	$4,538
Cost of Additional Energy dissipated	880	
Cost of Energy for Additional Air Conditioning	160	
Total actual cost	$5,420	$4,538
Cost difference	$882 or 19.5% more than purchase of aluminum enclosure switch.

ALUMINUM LIGHTING FIXTURES AND ACCESSORIES

Aluminum fixtures are available for almost every standard application. Alzak* reflectors are used extensively for high-quality lighting and especially where accurate light distribution should be employed. Among the applications requiring skillful control of light distribution are high bay lighting, floodlights and searchlights.

Among the many troffer-type fixtures widely used in offices and commercial applications is the Alzak troffer with parabolic reflectors and special, low brightness cross baffles or louvers. The outstanding features of this fixture are simple design, excellent quality lighting without the need of special lenses, low glare factor and high visual comfort index.

The rapidly spreading popularity of aluminum for troffers and luminous ceilings is due to its natural characteristics of light weight, excellent adaptation to light control, and economy.

[L 3760] # CONCLUSION

25277

It is hoped that this Alcoa Report has served to demonstrate aluminum's versatility and economy in electrical building products, and that those reading it will have gained some measure of useful information.

The correlation between the Alcoa Report and one section of the Ashley Report is very close. The latter included some conclusions and impressions from a poll of some 400 electrical contractors—all members of The National Electrical Contractors Association. The findings of the poll are summarized as follows:

1. Nearly three-fifths of the contractors had had experience with aluminum wire and cable.
2. There is a very widespread interest among contractors in aluminum electrical applications. Practically every contractor indicated a desire to be informed of the results of the survey.
3. There is a general opinion that aluminum is economical for wire sizes above No. 4/0, but noncompetitive below this size.
4. There is a strong awareness of aluminum splicing differences, coupled with the belief that present splicing methods are adequate and practical.
5. About half the contractors feel that there are appreciable labor savings in aluminum conduit installation, although some reported difficulties in conduit threading and steel tape pulling. The rest feel that there are economies, particularly in the larger conduit sizes, ranging in general from 5 to 30 per cent.
6. Four-fifths of the contractors who have installed aluminum feeder bus duct report installation savings. Most estimated savings are in the 5 to 20 per cent range.

This report is being deliberately submitted to echelons of business where it will provoke, we hope, considerable discussion from managerial, engineering, purchasing and operating personnel.

July 2, 1958.

Mr. L. C. Vipond
Office of Airports
Civil Aeronautics Association
Washington, D. C.

Dear Les:

One of our salesmen, Mr. Lawrence Kernan, has advised me of his recent visit and I hope this is just the beginning of more frequent calls at your office from Rome Cable personnel, including a certain R. C. Graham, as soon as he can get to it.

In regards to use of an aluminum conductor for L-824 Lighting Cable, our analysis indicates that a #6 AWG aluminum cable would definitely cost more and sell at a higher price than a #8 AWG copper in 600 volt Type A, 3,000 volt Type B and 5,000 volt Type B.

Simply as a matter of information, I might advise you that we have had very little experience with insulated aluminum buried directly in the ground. In fact, wherever we are selling a cable construction including an aluminum bare neutral it has become almost mandatory to use a wall of polyethylene insulation rather than neoprene in order to completely exclude any possible moisture affects.

If aluminum offered any economic or technical advantages in such a construction, I think we would be quite aware of its possibilities. However, I cannot visualize any economic or technical advantages if we must substitute the electrical equivalence as in this case.

Your interest in this matter is appreciated.

Kindest regards.

Very truly yours, Rome Cable Corporation, Bob. R. C. Graham, Chief Engineer.

Re: 14223/CMC/dw6145-FY60-3

Att: C. A. Weske, Procurement Division Director

Gentlemen:

This is in reference to your inquiry of August 25 to our Torrance, California, plant, pertaining to Portable Power Cable—600 volt, with stranded aluminum conductors.

There has been very little activity in the industry with aluminum conductor portable power cables. There has been some mining machine cable (parallel duplex) on which the service record showed very poor results due to the tension applied on the cable and due to the fact that it was run over by heavy equipment. Aluminum conductors do not have sufficient mechanical strength to withstand either of these punishments.

As a result, we do not have published information on this cable but are attaching hereto a general specification covering construction on 2/Conductors, 3/Conductors and 4/Conductors in both Type W and Type G—600 volt.

We trust this information will be of use to you, and if there is any further information required, please let us know.

Yours very truly, Rome Cable Corporation, O. O. Stedman.

PLAINTIFF'S EXHIBIT 377

October 19, 1959.

Mr. Harry Shopp, Chief Electrical Inspector,
County of San Diego,
1600 Pacific Highway,
San Diego 1, California

Dear Mr. Shopp:

I am sending this letter to you along with a copy to Art Vesco as I know Herb Ufer discussed this situation with you.

The point in question is whether or not bare aluminum wire should be used as a ground conductor buried directly in the earth. Our research department has done some Investigating on this and have come up with the following:

1. Problems involving the use of bare aluminum as a ground wire buried directly in the earth are inherent in the metal itself and cannot be attributed to poor quality of conductor. It is not felt that alloying the metal would help to the extent of being economical.

2. The Aluminum Company of America, the strongest advocates for the use of aluminum as electrical conductor, find it necessary to use copper for grounding conductors (buried in the soil) in and around their various plants. This company uses aluminum insulated conductors throughout in new installations.

In line with the above Rome Cable has reached a decision that they will no longer furnish or recommend the use of bare aluminum as a grounding conductor when buried directly in the earth.

We felt that the above information would be of value to you both.

Very truly yours, Rome Cable Corporation, R. D. Golly.

Internal Correspondence

August 24, 1960.

From: R. A. Schatzel
To: Mr. G. E. Rolston

Subject: Appliance Cords with Aluminum Conductor

Below is a report on development of SPT and appliance cords with aluminum conductors. If U/L approval is sought the problem and requirements are the same.

From the limited production on which this report is based the following conclusions may be drawn. If actual production were contemplated further development of improved methods would be required.

1) Based on the use of .010 aluminum wire we feel satisfactory bunched strand may be produced but at a slower speed than for bunching copper wire.

2) *Plastic Insulating*—With the use of a paper separator we believe that production of cord is possible. Down time due to breakage would be greater than with copper but tolerable. In short no insuperable production problems should exist.

3) *Cost*—If two AWG sizes larger for aluminum than for copper is required (16/al vs. 18/cu), #16 cord with paper separator would be comparable in cost with #18 copper without separator. From our tests on voltage drop, indications are that #17 AWG aluminum would be adequate. (Acceptance of this by Underwriters' could not be assured).

4) *Performance*—E.C. aluminum strand has inadequate strength and flex resistance to meet Underwriters' Laboratories indicated requirements.

[fol. 5766] Purpose:

To develop SPT Cord with aluminum conductors and to study the possibilities of the use of aluminum for this application.

Discussion:

The use of aluminum for the conductors of flexible cords would provide an outlet for considerable quantities of aluminum if it could be proven satisfactory for this service. Alcoa has been working for quite some time with the American Insulating Company on the development of SPT cord with aluminum conductors but the results have been somewhat less than satisfactory because of their inability to work closely enough with them to determine the problems involved in the manufacture of this product. The problem was, therefore, given to Rome Cable to determine if aluminum conductor SPT Cord could be economically produced and to investigate the possibilities of the use of aluminum for this application in comparison to the present U/L approved copper conductor SPT Cord.

Rome has been interested in using aluminum in appliance wire and cords.

Summary:

Samples of #16/2 and #18/2 conductor cord were produced. A preliminary study of costs indicates that a #16 aluminum conductor cord can be produced at a cost equal to or lower than the cost of a #18 copper conductor cord. The question was raised and tests were conducted which show that for this application, the aluminum equivalent may not need to be two AWG sizes larger than copper. If this is true, it would be a further cost advantage in favor of aluminum.

[fol. 5767] A comparison of the performance characteristics of aluminum conductor cord with copper conductor cord shows the aluminum to be relatively poor. The strength of the #16 conductor cord is approximately 75% that of the cord with #18 copper conductor and its flex life is roughly ⅓ that of copper. Underwriters' Laboratories have expressed themselves that for aluminum to be considered for this and appliance wire application, it should perform better than 50% as well as copper.

Procedure:

Sample Development

Wire Drawing

At the start of this investigation it was assumed that the .010" aluminum wire for stranding would be drawn at Rome. Several attempts were made to draw this on the old Rome fine wire drawing machines which had been set up for this purpose. After a considerable amount of work and investigation it was concluded that these machines were unsuitable due principally to slow drawing speed. .010" EC H-19 wire became available from Massena and wire from this source was used for most of the samples produced. The cost data for drawing .010" wire at Rome, which is shown later in this report, is based on providing Vaughn Ring Blox fine wire drawing machines and assuming that one operator could operate five machines.

Stranding

The .010" wire was bunched before annealing to take advantage of the greater strength of the hard drawn wire. Stranded conductor for the original samples was produced on the New England Butt buncher. After the Cook buncher from Massena became available, all strand was bunched on this machine as it was considered much more suitable. To [fol. 5768] avoid excessive breakage of the individual wires, the bunching speed was reduced to 50% of that used for bunching copper strand. At this speed there were relatively few breaks, but as the machine is not equipped with automatic stops, whenever a break did occur there was a loose end in the strand.

Annealing

The stranded conductor was annealed to ¼ hard temper.

Retipping

The aluminum strand was not retipped before insulating as is the practice with copper strand. Previous experience had shown that bunched aluminum strand is easily damaged by respooling, resulting in broken wires which cause "bird nesting" and conductor breaks at the insulator. Additional study of this problem is necessary.

Insulating

Samples of #16/2 and #18/2 were produced without separator and with paper fold separator. Without separator lengths ranged from 1000 ft. to 2500 ft., it being impossible to obtain longer lengths because of "bird nesting" and conductor breaks caused by the loose ends of broken wires in the strand. With separator the performance was much better, however, frequent breakage still occurs. More extended experience probably would lead to a solution. The separator was applied longitudinally at the extruder. It was also desired to obtain performance test data on the finished cord both with and without separator.

[fol. 5769] Samples and Preliminary Cost Data

Sample	Size	Strand	Insulated	Cost/M'
1	#18	16/.010"*	.126" x .227"	$ 7.38
2	#18	16/.010"**	.126" x .227"	6.72
3	#16	26/.010"*	.148" x .257"	10.18
4	#16	26/.010"**	.148" x .257"	9.09
5	#16	26/.010" paper fold*	.151" x .263"	10.42
6	#16	26/.010" paper fold**	.151" x .263	9.31
7	#18	42/34 bare copper	.126" x .227"	9.36

* .010" EC H-19 purchased from Massena. (More recent estimate from Pittsburgh, approximate Rome estimate).
** 3/8" rod purchased from Massena and drawn to .010" at Rome.

Tests:

Overall Strength Test

Samples of the finished cord were broken on the Scott rubber tensile testing machine. The results are the average of three tests.

Flexing Test

Samples were flexed on the Bureau of Mines Flex Testing Machine through an arc of 180° under tension of a six-pound weight. Results are the average of three tests.

Twisting Test

Samples were subjected to a twist test using the U/L twist testing machine for heater cords. Results are the average of three tests.

[fol. 5770] Results:

Sample	Lbs. Break	Flexing Test Cycles to Failure	Twisting Test Cycles to Failure
#16 26/.010 SPT-1 Al. Condr.	67.5	55	24
#16 26/.010 SPT-1 Al. Condr. with paper sep.	68.0	74	33
#18 16/30 SPT-1 Al. Condr.	39.0	43	16
#18 42/34 SPT-1 Copper Condr.	90.0	369	99
#18 16/30 SPT-1 Copper Condr.	88.0	220	65

The use of aluminum conductor in appliance wire and cords was informally discussed with Underwriters' Laboratories to obtain information on testing and possible requirements. U/L have previously made several investigations and have quite definite opinions. Without seeing any of our results or our opportunity to review theirs they seemed quite convinced that E.C. grade aluminum in these smaller cords would not meet service requirements. They felt that strength and flex resistance were inadequate.

The requirements they would stress were:

(a) Breaking strength compared to copper. Test to be made on uninsulated conductor. Strength should be at least 50% of soft copper.

(b) A complete study of the soldering techniques would have to be made in view of the fact that aluminum is reportedly much more difficult to properly solder than copper. In addition there would be a test on the flexibility of the soldered joint.

(c) A current flow test through soldered joints would be made which would be for roughly 60 days with a predetermined amount of current flowing. Following the current [fol. 5771] test the tensile strength of the joint would be made.

(d) A thorough study of the compatibility of insulating materials with the various soldering fluxes that might be used would have to be made.

(e) Various flexibility tests in comparison with #18 AWG copper would be made. These tests conceivably could range from a simple twist with pliers to the more complex cable flexing machines that we have. A lateral loop test would be involved here also, which is simply measuring the number of cycles taken to break the conductor when two points of the conductor are held a distance of 12 inches apart

and these points brought together and separated. This again would be compared with copper.

(f) The effects of corrosion on aluminum conductors under various atmospheres would be investigated.

(g) The impact test would be made as well as the standard crushing test.

In all the above tests they did feel it reasonable to expect that aluminum would do at least half as well as the results on copper. Up to this point their limited investigation indicates that aluminum is roughly about ⅓ that of copper with regard to flexibility. Our test results confirm this also.

Conclusions

1. Samples of aluminum conductor SPT-1 cord have been produced with a limited amount of success. It is believed that considerable improvement can be made but that EC grade aluminum will always be a problem from the standpoint of conductor breakage at the insulator. Breakage is no problem with copper conductor.

[fol. 5772] 2. Performance tests show aluminum conductor cord relatively poor in comparison to copper. Improvement may be attained if alloy properties can be developed.

3. A separator provides better processing and testing performance.

4. The preliminary cost data indicates that it would be possible to produce E.C. aluminum conductor cord at equal or lower cost as compared to copper conductor. Insulating costs because of use of separator and more breakage would probably remain higher than with copper. These could not be evaluated without production experience.

Firm of Edward E. Ashley
Consulting Engineers
10 East 40th Street
New York 16, New York

Dear Mr. Ashley:

We have given careful consideration to your letter of June 2 in answer to my letter of April 29th to you, concerning our proposal for a comparative study showing the economic advantages of utilizing aluminum building wire in lieu of copper building wire.

We certainly appreciate the time and effort that obviously has been put into the proposal outlined in your June 2 letter and after we have a clear picture of the basic engineering economics, then we will be in a better position to give careful consideration to undertaking the entire program as you have outlined it.

However, we feel that perhaps the basic economic advantage of aluminum should be evaluated before we decide on the mechanism for making this information available to others. We are particularly interested, at the present time, in the cost comparison study along lines outlined in my letter of April 29. Can you give us an estimate of just what this study might entail cost-wise? Also, can you estimate how long such a study might take?

Very truly yours, Aluminum Company of America,
R. R. Cope, Head, Electrical Section, Development Division

Confirmation

This will confirm my telegram of May 11th as follows: "We have received several reports today advising that Kaiser salesmen are quoting bare ACSR and aluminum conductor prices one percent off published schedules. Apparently covered conductors and service drop are not affected. Effective immediately we are reducing our prices by the same amount. New sheets dated May 11, 1959, are being published. Apparently Kaiser pattern is to reduce each price by factor of point nine nine and drop all digits beyond four decimal places. For example Peachbell X point 99 equals $.465993. Call this $.4659. Please follow this procedure pending receipt revised schedules. Revised prices will apply on all shipments made on and after May 11."

POLYETHYLENE INSULATED CABLES FOR PRIMARY DISTRIBUTION AND SIMILAR APPLICATIONS

By

R. C. Graham
Chief Engineer
ROME CABLE DIVISION OF ALCOA

The author presented a paper at the 1957 A.I.E.E. Winter Meeting on the subject "Polyethylenes For Higher Voltage Cables". It will be the object of this discussion to summarize elements of that and other information appropriate to primary distribution, together with a review of developments in this particular field.

HISTORY

Other authors at previous P.C.E.A. technical meetings have adequately covered the story of the birth and progress of polyethylene. Of interest to this group is the estimate that over 3,000,000 feet of polyethylene insulated power cable in the 5 to 15 KV ratings have been installed since 1947. Most of this is either underground, submarine, or in conduit - although considerable quantities of aerial cable are also involved.

Up until 1956 most of the experience was obtained in the plant distribution circuits of the chemical, oil, paper, and other heavy industry. Also, up until 1956 most utility experience with polyethylene was as insulation for station control cable, service drops, and series street lighting cables. However, since 1956 a steadily increasing quantity of polyethylene insulated cables in the 5 to 35 KV ratings has been installed by utilities for both underground as well as overhead primary distribution.

The satisfactory performance of polyethylene on these widespread and substantial historical applications point to an almost obvious expansion of its use which we believe will be principally in primary distribution circuits. Compared with other new non-metallic sheathed cable insulations, polyethylene has an outstanding performance record since World War II for these applications. In recognition of this experience the IPCEA-NEMA industry group have recently issued interim specifications for polyethylene insulated power cable through 15 KV rating.

The logical question is why should this material receive such consideration and interest for distribution circuits where the environmental conditions of a chemical or refinery plant are not present and since other well established types of insulation such as paper, rubber and varnished cambric have been doing a satisfactory job? There are various interesting technical reasons including reduced weight and dimensions, but the principal attraction involves economies which will be discussed later.

Polyethylene Insulation Characteristics

The electrical, chemical, physical and mechanical properties of polyethylene have been thoroughly documented in the literature by many authors.

[Vol. 5777]

Even while continuously immersed in water, it is electrically the best dielectric now used on solid insulated power cables. The electrical characteristics listed in the Table 1 are typical for polyethylene as compared with other conventional power cables.

TABLE 1

	Polyethylene	Butyl Rubber	P.I.L.C.	V.C.I.
Dielectric strength (a-c) Volts per mil	500	350	350	300
Impulse strength per mil	1300-1800	900-1200	1700-2000	900-1100
Dielectric constant (60 cycles)	2.3	3.5	3.5	6.0
Power factor (60 cycles)	.0004	.015	.008	.060
Insulation resistance (M per 1000 ft.)	50,000	20,000	10,000	5,000

Since polyethylene is a thermoplastic, its thermal properties are of major significance and an understanding of these characteristics is essential in determining proper cable design, ratings, and operating limitations. For example, the coefficient of expansion (volume) at maximum operating temperature is about 10.0×10^{-4} which is greater than other power cable insulations. This means that special internal as well as external shielding methods must be employed in the cable design to eliminate possible void formation during load cycles. Its thermal resistivity is in the order of 300-watt-cm units which is about one-half that for rubber, paper, and VC insulations.

Up to its softening temperature all electrical and, incidentally, physical properties of polyethylene are unusually stable as illustrated by the power factor comparisons in Table 2.

TABLE 2

Temperature Degrees Cent.	POWER FACTOR Polyethylene	Butyl Rubber	P.I.L.C.	V.C.I.
60	.0004	.015	.009	.070
70	.0004	.020	.015	.080
75	.0004	.025	.018	.087
80	.0005	.030	.021	.096
85	.0006	.040	.025	.110
90	.0007	.050	.030	---

* Maximum AEIC

** Maximum IPCEA

[fol. 5778]

The softening temperature for conventional polyethylene is 110°C and, when the entire volume of insulation reaches this temperature, it becomes soft in consistency, and upon cooling, could result in serious eccentricity and void inclusions. However, up to 100° centigrade the material exhibits negligible deformation (sometimes called cold flow) as illustrated in Figure (1). The development of higher density (linear) polyethylenes will appreciably extend the softening temperature.

This means that the limiting destructive temperature for conventional polyethylene is 110°C because of excessive softening. The destructive temperatures for other insulations are limited by other physical phenomenon but the end result is the same in that the cable will fail. For P.I.C.L. this value is in the order of 140°C because of oxidation of the oil and charring or carbonization of the paper. For V.C.L. this value is about 120°C. For ozone-resistant butyl insulation this value is in the order of 220°C. due to embrittlement and porosity of the insulation. For most polyvinyl chloride insulations this temperature is about 130°C because of excessive softening.

It has been demonstrated by test that a metallic sheathed polyethylene cable operated for a short time at an overload equivalent to a temperature well in excess of its melting point may, upon cooling, solidify in such a manner that the cable is still operative although an eventual repair or replacement is definitely warranted.

Table 3 illustrates a comparison of different 15 KV cable normal recommended maximum continuous operating temperatures as well as emergency overload ratings based upon 100 hours per year.

TABLE 3

Cable Type	Maximum Normal Temperature	Emergency Overload Temperature
Polyethylene	75°C	90°C
P.I.L.C.	81°C	96°C
V.C.L.	77°C	85°C
Butyl Rubber	85°C	100°C

The short time short-circuit ratings for polyethylene insulated cables with copper as well as aluminum conductors have been established and are given in an IPCEA publication P-32-382 dated August 1958.

It is an usual misconception that a failure on a polyethylene insulated cable will result in considerable melting and "flowing back" of the insulation from the point of fault. Deliberate fault conditions with conventional protective devices have been introduced on cable samples to

[fol. 5779]

simulate this effect. It was observed that the destructive area was limited to the same few inches as obtained with conventional insulations under similar test conditions.

Perhaps some mention should be made at this point regarding the long time effect of heat on polyethylene insofar as aging and oxidation are concerned. In a paper, "Accelerated Heat Aging of Polyethylene" by S. P. Foster and W. W. Spohn which appeared in December 1953 issue of "Wire and Wire Products" the following conclusion was made regarding the effect of accelerated heating aging on polyethylene. "The crystallinity of the polymer increases, reducing the apparent elongation. There is no oxidation degradation of the polyethylene under the test conditions used. Heat aging actually improves the polymer for some applications, such as wire and cable, and gives better abrasion resistance and less heat distortion at a given temperature."

Cable Design, Manufacture and Specifications

The design and manufacture of a polyethylene-insulated power cable follows conventional principles except that special precautions must be observed to eliminate the presence of any air voids and to guard against their formation in service. Excessive or continued ionization (corona discharge) in such voids produces an "eroding" effect that may lead to an eventual concentrated thermal failure due to heat of the arc. This effect has sometimes been referred to as corona cutting, which is a failure since polyethylene possesses inherently excellent resistance to corona. Because of the possible effects of internal corona it is recommended that only a cable design which has been proved to be corona-free at the operating voltage, both before and after load cycles, be specified. Failures due to this or similar causes on cable designed and produced in such a manner have been unknown.

The first important step in the design of a satisfactory polyethylene insulated power cable for the higher voltage ratings involves the use of a semi-conducting conductor shielding layer that is either adequately adherent to the polyethylene insulation or is one which may expand and contract at approximately the same rate as the insulation under load cycles.

Next, it is essential that the specified wall thickness of polyethylene insulation be extruded in such a manner so as to prevent any internal voids, bubbles, contamination, or strain. This requires a carefully controlled and gradual cooling of the insulation immediately after it leaves the die of the extrusion machine. We, based on test of our laboratories, recommend the use of high molecular weight natural (not colored) polyethylene for power cable insulation towards obtaining longest voltage life and maximum uniformity of other properties.

For the external shield, it is important to again utilize one of the various special or so-called "resilient" shielding methods to insure a corona-free cable at all times.

The outer jacket or covering may be either polyvinyl chloride thermoplastic

[fol. 5779]

simulate this effect. It was observed that the destructive area was limited to the same few inches as obtained with conventional insulations under similar test conditions.

Perhaps some mention should be made at this point regarding the long time effect of heat on polyethylene insofar as aging and oxidation are concerned. In a paper, "Accelerated Heat Aging of Polyethylene" by S. F. Foster and W. W. Spohn which appeared in December 1955 issue of "Wire and Wire Products" the following conclusion was made regarding the effect of accelerated heating aging on polyethylene. "The crystallinity of the polymer increases, reducing the apparent elongation. There is no oxidation degradation of the polyethylene under the test conditions used. Heat aging actually improves the polymer for some applications, such as wire and cable, and gives better abrasion resistance and less heat distortion at a given temperature."

Cable Design, Manufacture and Specifications

The design and manufacture of a polyethylene-insulated power cable follows conventional principles except that special precautions must be observed to eliminate the presence of any air voids and to guard against their formation in service. Excessive or continued ionization (corona discharge) in such voids produces an "eroding" effect that may lead to an eventual concentrated thermal failure due to heat of the arc. This effect has sometimes been referred to as ozone cutting, which is a fallacy since polyethylene possesses inherently excellent resistance to ozone. Because of the possible effects of internal corona it is recommended that only a cable design which has been proved to be corona-free at the operating voltage, both before and after load cycles, be specified. Failures due to this or similar causes on cable designed and produced in such a manner have been unknown.

The first important step in the design of a satisfactory polyethylene insulated power cable for the higher voltage ratings involves the use of a semi-conducting conductor shielding layer that is either adequately adherent to the polyethylene insulation or is one which may expand and contract at approximately the same rate as the insulation under load cycles.

Next, it is essential that the specified wall thickness of polyethylene insulation be extruded in such a manner so as to prevent any internal voids, bubbles, contamination, or strain. This requires a carefully controlled and gradual cooling of the insulation immediately after it leaves the die of the extrusion machine. We, based on test of our laboratories, recommend the use of high molecular weight natural (not colored) polyethylene for power cable insulation towards obtaining longest voltage life and maximum uniformity of other properties.

For the external shield, it is important to again utilize one of the various special or so-called "resilient" shielding methods to insure a corona-free cable at all times.

The outer jacket or covering may be either polyvinyl chloride thermoplastic

[fol. 5780]

or preferably black flame retardent (RoSeal) polyethylene in accordance with IPCEA specifications. Alternately, a lead sheath may also be employed as a covering either with or without further protective layers.

Because of economy and the advantages of longer lengths these cables are generally preferred in a single conductor arrangement although multiple conductor or triplexed assemblies may be satisfactorily designed and produced. The insulation thickness of the polyethylene has thus far been established as approximately 70% of the recommended thickness for rubber insulation which approaches dimensions of solid oil-impregnated, paper-insulated cable. This results in the comparative dimensions and weights for power cable as illustrated in Table 4 which indicates the possibility of easier and longer pulling lengths for polyethylene insulated and jacketed cable.

TABLE 4

Single Conductor 500MCM Copper, 15 KV Grounded Neutral

Cable Type	Approximate O.D. (Inches)	Approximate Weight (lbs. per 1000 ft.)
P.I.L.C. (Unprotected)	1.42	4100
Polyethylene (Non-leaded)	1.60	2350
Butyl Rubber (Non-leaded)	1.80	2700
V.C.L. (Non-leaded)	1.57	4150

Installation

Relatively simple low-cost installation procedures may be followed on polyethylene insulated constructions. Where polyethylene jacket is employed, no special pulling lubricant other than water is needed for pulling in ducts or conduit. For aerial, direct burial, or submarine installations, the same precautions and methods should be observed as for conventional, non-metallic sheathed, rubber-insulated cable.

Manual splicing and terminating methods have proved satisfactory for polyethylene power cable. Potheads are seldom required unless for some special installation condition. When potheads are used, the only real difference from other potted cable terminals is in the special filling compound used with polyethylene. Certain materials such as polyisobutylenes of the desired viscosity have proved satisfactory.

Figure (2) illustrates a suggested splicing procedure for shielded cable. The splicing tape is a special self-sealing polyethylene base material that resembles and handles like a rubber splicing tape. Distance "L" varies from 8 to 10 inches on 5 KV cable and 13 to 16 inches on 15 KV cable. Figure (3) illustrates a manual procedure for makeup of indoor terminations and Figure (4) illustrates an outdoor terminal.

[fol. 5781]

Economics

Figure (5) illustrates today's approximate price relationship for similar typical sizes of 5 KV rated power cables with copper as well as aluminum conductors covered with ozone-resistant rubber, solid paper, varnished cambric and polyethylene insulations. Since there is only a moderate difference in ampacities, we may evaluate all of these on an equal conductor size basis for all practical purposes. Analysis of this illustration indicates:

1. Polyethylene insulated cables provide by far the lowest cost unshielded non-metallic sheathed type of cable available today for this voltage range.

2. A 5 KV shielded polyethylene-insulated cable costs less than a 9 KV unshielded rubber-insulated cable.

3. Polyethylene-insulated cables are over 25 percent less costly than equivalent rubber-insulated designs.

4. The lowest initial shielded cable cost involves P.I.L.C. (paper insulated lead covered) which in the 9 KV range is about 5 percent less than shielded polyethylene. However, this differential could well be eliminated if evaluated on a "final installed" basis since the lighter weight and use of manual splicing and terminating methods for the polyethylene cable would provide appreciable savings in installation cost. Further, if a corrosion protective barrier or other coverings were added to the P.I.L.C., then even the initial cost of the polyethylene non-metallic sheathed cable would be less, since this latter cable would not ordinarily require such additional protection.

5. It is interesting that a 15 KV shielded polyethylene cable actually costs less than a shielded 5 KV ozone-resistant rubber-insulated cable for the same conductor size.

6. It is also significant that, at today's relative metal price for copper and aluminum, only polyethylene-insulated cables reflect any savings by incorporation of the equivalent size of aluminum conductor. In other cables, particularly rubber and V.C.D., the increased cost of coverings on the increased "equivalent" conductor dimensions more than off-set the relative metal savings; whereas the inherently lower covering costs for the polyethylene cables permit some metal savings. Of course, these differences will vary and are greatly dependent upon size and voltage rating.

Such economics warrant serious consideration of polyethylene-insulated cables for the lowest-cost underground primary system for residential distribution.

[fol. 5782]

Underground Residential Distribution

With recent development of the pad mounted transformer, this new form of distribution has become a popular subject with most utilities. It is not within the scope of this discussion to compare duct vs. buried systems or to compare the relative merits of 4160 vs. 12000 volt primaries. In any case, the cable cost is a very significant part of the total cost and it becomes imperative to seriously consider this element on an installed basis if the famous cost ratio to overhead is to be held within reason.

The previous dissertation on the economics of polyethylene insulation leads to the correct idea that here is a material almost tailor made for the job. Further, the incorporation of a lead sheath results in additional savings over a design involving shielding tapes and jackets. The overall lead sheath in proper thickness provides a truly impervious covering, full "tubular" electrostatic shielding, continuous grounding if buried, a degree of mechanical protection, and most if not all of the desired neutral capacity. This low cost lead sheathed, polyethylene insulated "concentric" cable design is now being used in substantial quantities by at least three operating companies. Simple manual terminating and splicing procedures are used. Occasional damage to the sheath does not result in cable failure since the insulation itself provides an adequate moisture barrier.

Over 15 KV

In addition to some European practice at higher voltages, there are at least three installations operating in this country in the 35 KV range. The first, installed in 1956, is described in the 1957 AIEE paper referred to in the opening paragraph. The second job involves an aerial cable installation described in AIEE paper 59-496, "A 35 KV Polyethylene Cable Installation" by G. J. Crowdes, and presented at the AIEE 1959 Summer General Meeting in Seattle. The third installation is very recent and involves nearly 10 miles of an aerial cable circuit at a large eastern utility. These applications lead to the belief that future developments will make polyethylene insulated cables practicable for circuit voltages in excess of this - perhaps as far as 69 KV, but not much beyond due to inherent material limitations.

Future

New polyethylenes promise a bright future for cable insulation. The high density materials have interesting properties, such as higher softening temperatures and greatly increased toughness, although their inherent stiffness may limit their general application in power cable. Trial installations of this material on 5 KV overhead circuits have already been made. New cross-linked polyethylene polymers hold great promise and other polyolefins materials such as polypropolene may provide an answer towards still better cables. The possibility of irradiated polyethylene must not be overlooked in looking forward with polyethylene.

Overhead Cables for Distribution

CURRENT TRENDS

No. 6 in a series of articles

Up until the last decade practically all overhead distribution involved some form of open-wire construction. Probably the most advantageous factor justifying this procedure has been economy plus an acceptable experience record. Like everything else, times are changing so that it is no longer axiomatic that open-wire circuits must continue to be used for overhead power distribution. Therefore, a brief story behind some of the modern cable designs for these applications may be of interest.

The need for cable is unquestioned. Overcrowded poles, severe tree conditions, storms, public relations, regulation problems and appearance are some of the contributing reasons for this need. The cable industry in recognition of this need has developed suitable cable products for almost every overhead distribution job and the Rome Cable Corporation has played a most active role in this progressive development. Cable costs have been so reduced by careful design and use of new materials that installed economics now closely approach open-wire construction in many instances. Today's distribution engineer would be remiss if he did not at least consider an appropriate type of cable for his new or replacement overhead distribution circuits. Rome Cable is prepared to supply all of these products and associated engineering services.

Primaries

There is a definite trend towards aerial cable in the 5 kv to 15 kv range but it is difficult to conclude whether this trend is more in factory-assembled or the field-assembled variety, since there are merits for each.

In the 5 kv range the cost of cable compared to open-wire construction may not be too attractive when evaluated on the installed cost per mile of line, averaging approximately twice as much. In the 15 kv range this picture improves somewhat. However, if this comparison is based upon final installed cost per KVA this differential between cable and open wire is considerably narrowed. Naturally, there must be other determining reasons for using cable, such as improved appearance, resistance to storms, less tree trimming, better voltage regulation and greater reliability.

Preference for cable design in the 5 kv rating utilizes ozone resistant rubber insulation (such as Rome Cable RoZone) with a suitable nonmetallic sheath (such as Rome Cable RoPrene or RoSeal) . . . unshielded and relatively easy to hot tap, particularly when the cable incorporates the "reverse-lay" feature. Economic preference for cable designs for the higher primary voltages, utilizes the same grade of insulation on each conductor covered with a bronze tape which serves as a combined shield and armor but makes "hot tapping" difficult and hazardous. These and other cables may be supplied with insulated copper or aluminum power conductors all properly bound to the correct Copperweld messenger as described in the new IPCEA-NEMA specifications for aerial cable or an equivalent type. Installation procedures for factory-assembled or field-spun cables are described in the technical literature as well as manufacturers' catalogs.

Secondaries

Until quite recently there has been relatively little activity or interest in using cable for overhead secondaries but several utilities have been investigating and experimenting with either field- or factory-assembled cables for this application. Joint pole construction, elimination of crossarms, reduction of hardware, ease of installation, improved appearance, storm resistance, improved regulation and less tree trimming are some of the features to be realized, provided final installed cost is not prohibitive.

It is here that aluminum, at least for the phase conductors, seems to offer definite economic and technical advantages since the lighter weight is a most useful feature for line construction. With the advent of these popular Triplex construction for service drops the idea of a similar factory-assembled cable for secondaries has certain merits. For single-phase secondaries, this cable generally consists of two insulated aluminum conductors (usually # 1/0 or # 2/0 AWG aluminum) spiralled around a suitable neutral messenger.

When this cable is used on conventional 150 foot pole spacings the service taps can be made at or near each pole with special fixtures now available. However, it is obvious that greater savings are possible with increased pole spacings and "flying" midspan service taps made where possible or convenient. Prefabricated designs to accomplish these taps have been developed. Thus, the combination of Triplex secondaries and services offer a new and advantageous construction idea at modest cost.

When secondary sizes larger than # 2/0 AWG are required, either spinning or a cable construction similar to primary aerial cable is suggested.

Services

The use of open-wire service drops is rapidly disappearing particularly in new construction and housing developments. Service drop cable, Type SD, utilizing concentric neutral has been too costly to merit universal acceptance unless some special feature such as reduced theft possibility was desired. Nine years ago the Rome Cable Corporation introduced the new popular neutral or self-supported Triplex type of service drop cable. This design received almost instant acceptance and has proven highly satisfactory. The power conductors, insulated with polyethylene, or Neoprene, are spiralled around a neutral messenger in accordance with IPCEA recommendations.

Aluminum unquestionably offers economic and technical advantages for the power conductors and has become the general choice of metal for this particular application. A popular neutral messenger has been a reduced size ACSR but the idea of hard-drawn copper has been gaining favor, particularly where there is planning towards Triplex secondaries with Copperweld messengers in order to provide copper-to-copper contacts on the exposed neutrals. Consideration of this "combination" design is suggested.

For further information on Triplex services or secondaries we suggest you obtain Rome Cable Bulletins RS-5 and MST-1.

Tree Wire

This discussion would not be complete without some reference to so-called Tree Wire installed on insulators for overhead construction. For primaries and unusually important secondary circuits this product would cost considerably less than insulated cable and somewhat more than weatherproof wire. Where extensive tree trimming is a problem or too costly the use of the newer low-cost special thermoplastic Tree Wire designs might be considered. Here, again, Rome Cable is ready with the information and the product.

PLAINTIFF'S EXHIBIT 387

Exhibits in Reynolds Metals Company depositions of John H. Krey, W. M. Franklin, Robert L. Teeter, Allyn Dillard.

March 29, 1961.

[fol. 5790] Confidential

January 28, 1959

Minutes of Insulated Wire and Cable Discussion

Copy sent to John Krey, February 2, 1959

Present: Messrs. W. M. Franklin, H. A. Adams, J. C. Warford, R. L. Teeter.

The Reynolds Metals Company has been meeting increasing objections from its customers, particularly its distributors, regarding the incompleteness of its line of wire and cable products. Since Alcoa's acquisition of Rome Cable Co. last week now leaves Reynolds as the only major aluminum or copper company without insulating facilities, it is expected that our sale of metal to electrical applications will suffer materially if some action is not take to enlarge our wire and cable product line.

It was recognized that our recent acquisition of the British aluminum stock, prohibited any early acquisition of a wire and cable company. This meeting was, therefore, called to consider what other alternatives might be available.

Messrs. Franklin, Adams and Warford felt that installation of our own compounding stranding, and installation facilities would be the next best alternative to acquisition. Pending detailed study of exact product line requirements and necessary facilities additions, it was expected that at least 2 to 3 million dollars immediate investment would be required.

Mr. Teeter did not agree that installation of our own facilities was the best alternative. He pointed out that establishment of the necessary reputation for quality and know-how in insulated products manufacture would take at least several years. In addition he questioned the availability at this time of the necessary 2 or 3 million dollars, particularly in view of the fact that a satisfactory return on investment could not be conservatively claimed for a period of several years after the installation. Finally, all agreed that the ability to offer copper products, where superior, was very desirable. Installation of our own facilities would permit this to only a limited extent.

All agreed that if funds were not available either for acquisition or for installation of our own facilities, a satisfactory temporary solution might be a team or joint merchandising arrangement with one of the better remaining independent insulated wire and cable manufacturers. For example, we could arrange to merchandise some of their items under the Reynolds' insignia, recognizing the source if desirable, and they could merchandise our wire and cable products similarly if they so desired. The following possibilities were discussed:

1. *John A. Roebling (Subsidiary of Colorado Fuel & Iron Co.)* This company has a national reputation for competitive quality, and a product line containing predominately those items subject to early penetration by aluminum, such as power cables, magnet wire, building wire, etc.: They do not manufacture ACSR and [fol. 5791] related products, thus a team merchandising arrangement would permit them to augment their own product line to their benefit as well as to ours.

   In addition, whereas we now buy the steel core wire for our ACSR from Detroit Steel, Roebling also offers this material and might in this manner be able to obtain our account.
2. *Simplex Wire & Cable Co.* It was doubted if any partnership arrangement would be of interest to them. Although their facilities are suitable, they do not currently manufacture building wire, service entrance cable, overhead transmission cable, or magnet wire; all of which would be of interest to us.
3. *Essex Wire Corp.* These people have previously indicated an interest in working with us in connection with a molten metal arrangement, but their line and reputation for quality are not as suitable for a team operation as the preceding companies.
4. *Triangle Conduit & Cable Corp.* Messrs. Adams, Franklin and Warford felt that this company was the least attractive of the four major independents for a team arrangement. In particular, its line does not include the heavier industrial cables of most interest to us.
5. *General Cable Co.* Too large to be interested.

6. *General Electric Co.* Except for the complicating legal problems raised, G.E.'s product line would fit nicely in with our own, and they could benefit from the addition of our line.

In addition to the above noted U.S. companies, Mr. Teeter advised the group of the existence of a partnership between Canadian British Aluminum and the Phillips Electrical Co. Ltd. in Canada called Phillips-CBA Conductors, Ltd., for the production of wire and cable products. Additional information is to be obtained about this relationship to see if our product line could be usefully supplemented by arrangement with Phillips-CBA Conductors.

The above possibilities are to be discussed with our respective managements, to be pursued as they indicate.

Robert L. Teeter.

RLT/rk

PLAINTIFF'S EXHIBIT 388

A Plan for the Joint Promotion of Copper and Aluminum in the Electrical Market By Phelps Dodge and Reynolds

Introduction

In view of the large price differential favoring aluminum over copper in the electrical field it is inevitable that we shall see a continuing substitution take place as technological improvements are made in overcoming aluminum's inherent mechanical disadvantages. First there was the overhead transmission cable, then the overhead distribution cables and the service drop cables and now the aluminum companies are organizing to go after the insulated cables.

Kaiser took over the U. S. Rubber Company's wire and cable division and launched a vigorous campaign to pro-

mote aluminum building wire and power cable but being the only company really pushing these products they have not made too much progress.

Alcoa bought the Rome Cable Company and have put in one of their own men as Vice President and General Sales Manager and we can expect that they will now aggressively push aluminum insulated cables along with Kaiser. Progress in the utility field can be expected as they are greatly concerned about rising costs and the stepping up of the public power competition. In the industrial and construction fields the price difference cannot help but bring about a greater use as soon as methods are found and publicized for overcoming the troubles with connectors and joints.

The next move was when Reynolds told us in June that they were going to go aggressively after the electrical market in which they had not been much of a factor. They intend to do one of three things—build a completely new facility estimated at around $30,000,000, purchase an existing company and enlarge it, or work out a deal with us to jointly promote both copper and aluminum in the electrical market. [fol. 5793] At the meeting held on June 17th between officials of Phelps Dodge and Reynolds, it was agreed that there was a sufficient common interest to justify having a joint task force prepare a plan whereby the two companies could cooperate in the sale of aluminum and copper in the electrical market, it being the feeling that the total volume of sales would be greater if the two companies acted together than if each went its own way.

Plan I developed by the task force called for a joint sales company equally owned which would sell the products manufactured by each of the parent companies. Reynolds rejected this because they did not think the sales company would have enough substance binding the two parties together with the result that it could come apart too easily.

Plan 2 was primarily Reynolds thinking and called for the joint company to lease the cable-making facilities of Habirshaw and their cable mill at Listerhill, Alabama. We were not enthusiastic about this because the leasing arrangements would be very complicated and they would have equal control of the company of which 80% of the sales force would be our people and the volume of copper products would be almost three times that of the aluminum products.

We have now come up with Plan 3 which so far has only been roughly outlined to Reynolds.

Basically, the plan calls for the formation of two companies, a manufacturing company to be equally owned and a sales company to be owned two-thirds by Phelps Dodge and one-third by Reynolds.

The manufacturing company would be known as "Phelps Dodge Reynolds Wire and Cable Corporation" and it is proposed that it be located in the south or middle west. [fol. 5794] One possible location would be the U. S. Rubber Company's plant adjacent to our Inca plant. This would have the advantage of enabling the company to get into production a year earlier than if a new facility were built and in view of the proximity of I. R. & W. would eliminate the necessity of having any copper wire drawing or stranding equipment in case it was necessary to fill out the manufacturing at times with copper products as these products could be obtained from our I. R. & W. plant.

The plant is more than adequate for the proposed operations, comprising 568,000 square feet on 60 acres of land. There would be ample space for the proposed operation, including space for a rod mill, casting shop, and a reasonable amount of room for further expansion and storage.

This plant would be on the lines of the American Electric Power Corporation which is a large user of aluminum transmission cable but unfortunately also has Anaconda, Essex and Kaiser on their lines. Ormet is also a large customer of theirs so any cable company using their aluminum would have a reciprocal position, therefore, consideration should be given to locating the plant on the lines of a utility system that could do more for us such as the Southern Company or Texas Utilities.

The plant would have the most efficient possible setup for the manufacture of aluminum cables in view of the very competitive nature of this market. This would involve a new rod mill particularly as Reynolds does not have a rod mill at present. It produces its rods by slitting heavy sheet.

Reynolds would contribute the wire and cable equipment [fol. 5795] now at its Listerhill plant on a depreciated value basis, and would discontinue that mill.

An estimate of the capital needed for the manufacturing company is $20,100,000 made up as follows:

Purchase price of U.S. Rubber plant	$ 4,000,000
Alterations of building	400,000
Equipment	5,200,000
Installation cost	1,200,000
Rod mill, including installation	2,000,000
Casting facilities	500,000
Pre-operating expenses	700,000
Engineering	700,000
	14,700,000
Contingencies (10%)	1,500,000
	16,200,000
Inventory of lifo aluminum and other materials	2,400,000
Other working capital	1,500,000
	$20,100,000

The above estimated equipment costs are based on new equipment and do not take into consideration the equipment to be furnished by Listerhill. The cost of the new equipment included in the above estimate corresponding to the Listerhill equipment is $2,600,000.

The proposed initial capacity of this plant, based upon the estimated business the sales company could obtain in 1960 would be approximately:

ACSR transmission cable	$15,000,000
All-aluminum bare cables	2,000,000
Aluminum bare and covered line wire	3,000,000
Aluminum service cable	1,500,000
Aluminum building wire and power cable	3,500,000
Total	$25,000,000

This would require approximately 50,000,000 pounds of aluminum per year although initially, at least, a part of the building wire production might be made with copper conductors.

[fol. 5796] The estimates are based on the following operating rates:

	1960	1965
Drawing	1 shift	3 shifts
Stranding	1½ shifts	3 shifts
Cabling	1½ shifts	3 shifts
Extruding	One or more shifts, depending upon the insulating volume of the various compounds.	

The above tabulation might seem to be out of balance for a five-year growth, but it is necessary to have a large initial investment in machinery, especially in ACSR, in order to obtain the required percentage of the immediate market.

Reynolds have indicated that at the present time they are doing $12,000,000 a year of ACSR transmission cable, all aluminum bare cables and line wire. They estimate that by 1960 the total market for these products will be 300,000,000 pounds or about $150,000,000, therefore, our sales of $20,000,000 would only be about 13% of the market.

Aluminum has replaced copper to a large extent in the service cable market and we believe the joint company can reach the $1,500,000 sales figure in 1960.

In our opinion the $3,500,000 figure for aluminum building wire and power cable for 1960 is on the high side but Reynolds are convinced that this market is going to develop rapidly and that by then we should be able to reach this amount.

Nema statistics unfortunately do not help us too much in forming our opinion on this as there are companies who are important in this field which do not report to Nema. Nema's aluminum sales only show $2,000,000 for the first six months of 1959.

The sales company is outlined in the attached memorandum.

[fol. 5797] It is recommended that we submit Plan 3 to Reynolds for their consideration making it clear that it is submitted for discussion purposes of the task force and has not yet been fully approved by Phelps Dodge, although we do consider it as a definite possible method of operating. If this plan should eventually be approved it would be our suggestion to proceed immediately with the formation of the sales company and agree to go ahead with the manufacturing company but consideration should be given to the fact that the prices for aluminum wire and cable at the present time are so low that the manufacturing company could not possibly show a profit using the market price of aluminum ingots. In fact some items are so low that the aluminum would have to be put in at no cost, therefore, the joint manufacturing company's new facility should be postponed until there are signs of better prices or some way is found whereby Reynolds can underwrite this loss the same as Kaiser and Alcoa must be doing for their fabricating subsidiary.

February 1, 1961.

Mr. John H. Krey, Vice President
Reynolds Metals Company
6601 Broad Street Road
Richmond, Virginia

Dear Mr. Krey:

The following will confirm our recent discussion. Our Board of Directors has decided to liquidate a portion of our Electrical Wire Division and we are now in the process of accomplishing the project. In this connection we wish to sell, as is, where is, certain machinery and equipment used in the manufacture and testing of electrical wire and cable, and located in our Buckthorn Plant, Trenton, N. J., and our Copper Wire Mill, Roebling, N. J. Excluded from the sale would be:

(1) The equipment used for cleaning and bundling copper rods, and for electrolytic copper recovery and overhead tramrail system, all located in the Copper Wire Mill.

(2) Equipment which is properly considered a part of the real estate or facilitates its operation and sale, such as the equipment contained in the boiler house, the electrical distribution system, yard railroad tracks, fire protection equipment, overhead cranes, incinerators, elevators, docks, radio and transportation equipment used by plant guards, yard railroad tracks.

(3) Office furniture and equipment, time clocks, certain industrial lift trucks.

We are prepared to sell this machinery and equipment at a price of one million dollars ($1,000,000). Any such sale would, of course, be subject to our mutual agreement on a list of items of machinery and equipment to be sold, arrangements for the removal and reconditioning of buildings after removal and detailed terms and conditions of sale.

Very truly yours, William C. Ridge, Executive Vice President.

Executive Vice President
John A. Roebling's Sons
640 S. Broad Street
Trenton 2, New Jersey

Dear Mr. Ridge:

This will reply to your letter of February 1, 1961.

Since your letter was received there have been, as you know, further discussions about the exclusions which you mentioned, and there are to be certain changes in the items which you listed. I believe it is now understood also that there is not to be any arrangement for reconditioning of buildings. Subject to these qualifications, your letter in general is in accordance with our understanding.

As you know, the inventory of equipment has not been completed. In order to clarify further our understanding of the items which are to be included in the sale I have asked Mr. Hedgecock to indicate in a general way the items which he understands are to be included. The list which he has prepared is enclosed.

Sincerely yours, John H. Krey, Vice President.

Enclosures

[fol. 5800] Items to Be Included in Sale

Copper Mill

This includes all of the production equipment in this building and its accessory items. This primarily consists of the complete tin plating lines, stranding equipment, marking and forming machines, wire drawing equipment including solution pumps, tanks, furnaces complete with atmosphere converter and controls, wire shaving equipment, turkhead and flattening equipment, bunching and spooling equipment, portable and floor scales, specialized handling equipment including industrial trucks, both rider and hand operated, battery charging equipment and batteries, complete die room equipment including all dies, equipment spare parts including motors and controls, wood and steel pallets and wood and steel reels, D. C. rectification equipment, including transformer, small maintenance shop and portable equipment, overhead tramrail and handling equipment serving production machinery including grabs, skids, all butt welders and brazing equipment, miscellaneous wire balers, wrapping machines, all motors and control equipment serving production units, tensile and electric test room equipment, operating data and instructions and records, including equipment drawings.

This excludes office equipment, rod cleaning system and tanks, copper recovery system, tramrail and other handling equipment over this area, workmen's locker facilities, general lighting, air and water piping.

The above basically includes all of the production and associated equipment listed in the copper mill asset records dated January 1, 1961 as Report No. 999, with the above listed exclusions. Not listed in this asset record but included in this transfer are miscellaneous supplies and equipment concerned with the production equipment and operations.

Buckthorn Plant

This includes all of the production equipment in this plant, as well as its accessory equipment. It also includes all operating data and instructions and records, including equipment drawings.

All maintenance shop equipment including maintenance

and production equipment and spare parts and hand tools and miscellaneous maintenance equipment for electrical, riggers, millwrights and other trades, box shop equipment, [fol. 5801] pipefitters shop equipment including hand tools and miscellaneous pipefitting maintenance equipment, air compressors and accessories, floor maintenance equipment, platform and floor scales, all laboratory and production testing equipment and accessories, development laboratory equipment associated with power cable.

All salvage center (stripping shed) equipment, all portable and floor scales. All industrial trucks including batteries and charging equipment. All general type material handling equipment including grabs, slings, etc. All D. C. generating equipment for production machinery and testing, all rubber mill equipment including Banbury mixer, conveyors, mills, calenders, tubers, slitters, boxes, bins, braiders, all patching equipment, continuous vulcanizing machines, cabling equipment, electrical test equipment, saturators, lead extruder equipment, lead strippers, strip covering machines, taping machines, test sparkers, service entrance machinery, spoolers, universal winders, presaturating equipment, Dialec wrappers, spiral marking striping, printing and polishing equipment, coilers, plastic extruders, testing and reel equipment, all tool room equipment and tools, vulcanizing equipment (dome and horizontal), rubber filling machinery, ventilating equipment, lacquering equipment, all winding machines, large and small coilers and other shipment preparation equipment, paper insulating and belting equipment, varnished cambric insulating equipment, taping equipment, all spooling and rewinding equipment, armoring equipment, curing tube equipment, horizontal and vertical impregnating tanks, pumps, oil purification systems and associated equipment, lead presses, lead melting pots, control pumps, all tools and dies for all equipment, all film covering (enamel wire) equipment, controls, rewinders and associated equipment, including weighing, wrapping and packing units, all fibrous covering (magnet) wire insulating and rewinding equipment.

The above includes all spare equipment parts, tools, dies, reels, spools, pallets and accessories for the production equipment. It is also assumed that the equipment attached to and part of the basic production equipment is included,

making each piece of equipment a complete operating machine.

The above basically includes all of the production and associated equipment listed in the Buckthorn Plant asset records dated January 1, 1961, as Report No. 999. Not included in this report but included in this transfer are miscellaneous supplies and equipment concerned with production equipment and operations.

Mr. D. P. Reynolds
General Sales Office

Dear Dave:

Subject: Insulated Wire and Cable Program

One of the most important projects we have before us at present is firming up a program on increasing the supply of aluminum to the electrical industry.

Walter Franklin, Dr. Irving Roberts, and others are presently investigating companies in the insulated wire and cable field with regard to their line of products, the physical making of equipment, and evaluation of products most adaptable to conversion to aluminum.

My feeling at this time is that the die is cast on direction we should take. Our principal competitors in primary production are committed to integrated supply of these products. General Cable will be affiliated with Olin-Revere Reduction Company. Kaiser has purchased U.S. Rubber, and I believe will acquire others. Anaconda has the Anaconda Wire and Cable Company.

To properly introduce and merchandise insulated wire and cable products, you must be in a position to have product control. Also important is a complete line of products to become a factor with the supply houses or distributors. They will want to associate themselves with a company with an integrated and complete line.

My purpose in this letter is to emphasize these points and ask that you personally review this subject with the group involved as soon as they complete their reports and have recommendations.

With best regards, J. M. Stuart.

PLAINTIFF'S EXHIBIT 398

Memorandum from
Corporate Finance Department

June 4, 1958.

To: W. C. Huebner
From: J. M. Rae
Subject: MEFA-8285

On Tuesday, May 27, 1958, I talked with the following people in Philadelphia regarding the company in Conshohocken, Pa.

Mr. William B. Walker, Executive Vice President
The First Pennsylvania Banking and Trust Company
Mr. Garner O. Fletcher, Sr. Trust Investment Officer
Girard Trust Corn Exchange Bank
Mr. John H. Rypass, Partner
E. W. Clark & Co. (Investment Bankers)
Mr. Shaler Stidham, Vice President
The Philadelphia National Bank

and in Conshohocken, Pa:

Mr. Donald P. Horsey, Vice President
The Philadelphia National Bank (Branch Manager)

Principal bank of account is the Philadelphia National Bank. It came to them through the bank in Conshohocken which they bought and now operate as a branch. The company has done business there for many years.

The senior management are men of long residence in Conshohocken, active in community affairs, the Presbyterian Church, and are very highly regarded. Opinion is that they are the type who would get along well with other management people.

They have been approached a number of times recently by people seeking to purchase or acquire this company by one means or another. The answer to such proposals has so far been a definite No! That does not mean, however, that an approach by our client would be rebuffed. One of the

officers at Girard Trust has a good entre through the Company's auditors through which he can ascertain the owner's true attitude regarding acquisition under the general conditions our client proposes. He will do so and write us the information he obtains. (Note: we asked this officer to refrain from any follow up).

All of the stock is held by Mr. H. S. Walker, the Chairman, and his family, and the family of his brother who died not long ago. Mr. Hervey J. Walker is 79 and certainly should understand and appreciate matters of estate taxes and capital gains taxes. He is the power in this company, very able, and has actually been the active operating management head for many years.

[fol. 5805] A. M. Callanan, Vice President, is the second man on the senior management team. He has always been and still is the principal marketing man for the organization. I am told he is a very able man, but he also is about 70 years old.

The third man on their senior management team is A. T. Cameron, Executive Vice President. He is the financial man, and an excellent one. Again, however, he is about 70.

Presumably, these three senior officers are about ready to retire. To take their places, I am informed that the company has a solid and progressive successor management team to take over. They also, I understand, are people who would fit in well for the kind of relationship our client seeks.

I am told the company has excellent products used for electrical transmission and distribution, both aluminum and copper cable of best modern type, also steel conduit products, and similar items. They have a nation-wide market which they serve through independent distributors. The distributor organization is said to be a very good one. Sales have shown very substantial growth in recent years, and they have more than kept up with the industry. Sales in 1957 were about $21 million, I understand, and profit margins are very satisfactory, but I couldn't get the exact figures.

The plant, I understand, is in excellent condition and much of the equipment is new. Manufacturing is said to be excellent. They have above average production management, thoroughly competent labor, and good labor relations. Products are well engineered and the company is alert in research

for new developments. A new product for which sales have been substantial and growing is known as the "underflooring" line.

Financially, the banks regard this company a strong and a very high credit risk. They believe it to be thoroughly sound in this regard, with excellent financial management. I was told they have a revolving credit line of $2,000,000 and currently borrowing about $1,000,000 from the principal bank.

In brief, this seems to be an excellent company in every respect.

In regard to Crescent Insulated Wire & Cable Co. (Inc.) in Trenton, I was unable to obtain information from Philadelphia banks other than that they do its banking with the Trenton Trust Company (known as Mrs. Roebling's Bank).

bc—F. W. Ohles, R. E. Pierce

July 25, 1958.

Mr. Donald P. Horsey, Vice President
The Philadelphia National Bank
Fayette at Fifth Avenue
Conshohocken, Pennsylvania

Dear Mr. Horsey:

I wish to thank you for bringing our interest in Walker Brothers to the attention of the Board at its July 22 meeting.

Naturally we are disappointed Mr. Hervey Walker should

be so firm in his decision about an exchange of stock with our client. In the event there is a change in his viewpoint, I think it desirable to indicate that our client's interest may be continuing even though it acquires another company in this field.

We have to respect the request for confidentiality but some background leading up to our contact of you may be of interest in the event there is a reconsideration in the future.

As you know, we are not commission brokers and our interest is in helping a client with whom we have had a long business association as both customer and client and which has resulted in their high regard for our discretion and for our judgment in the utility field.

Our client is desirous of expanding into the electric utility supply field. It specified that any company we might suggest have a well engineered product of high quality; a competent management of high integrity; the management willing and able to stay on and run the company; and an exchange of stock preferred though a cash transaction will be acceptable.

Walker Brothers was one of a number of companies we suggested for consideration which was satisfactory. We, of course, would not remain in the picture if Mr. Walker sincerely wished to discuss this matter directly with our client, but until it was certain there was genuine interest our client did not want it known that it was seeking to diversify. Also, although it is not looking for a bargain acquisition, any arrangement must be fair to both parties.

[fol. 5809] The stock of our client is listed on the New York Stock Exchange and has a long record for continuous dividend payments. Its revenues run well into the hundreds of millions of dollars and its financial strength would not be taxed in the slightest by any acquisition we have so far suggested. We are quite proud to be associated with this organization and know that you and the Walker company would be also.

Thank you again for your intercession and hope you will visit us if you ever have the opportunity when in New York City.

Sincerely yours, Walter C. Huebner, Assistant Manager.

[fol. 5811] Memorandum from Corporate Finance Department

July 17, 1958.

To: File
From: W. C. Huebner
Subject: The Okonite Company

There have been rumors circulated recently to the effect that both Kaiser and Phelps-Dodge were discussing acquisition with Okonite. On July 16 our assignment with respect to investigating the possible acquisition of Okonite was discussed with Mr. Edwin R. (Rex) Williams, Vice President (Special Situations) of Chase Manhattan Bank.

Okonite is a client of Chase and its account is under the supervision of Mr. Earle Allen, Vice President, Commercial Department, handling all accounts in the states of New York and New Jersey, with the exception of New York City proper. Mr. Allen was brought into the meeting and today visited Mr. Albert F. Metz, Chairman of the Board of Okonite at the company's headquarters in Passaic. The purpose of the meeting was to discuss with Mr. Metz, as his banker, the recent publicity given to possibility of the sale of Okonite and to ascertain validity of these rumors.

Mr. Allen told Mr. Metz, who is a close personal friend of his, that another client of the Chase is in a position to discuss acquisition with Mr. Metz if management was seriously entertaining any thought of selling the company.

Mr. Metz very emphatically assured Mr. Allen that Okonite was not seeking an acquisition with any other company, that in his opinion rumors of this sort were cast forth more to stir up a little action. Although the company's sales had fallen off along with the rest of the industry and there had been abnormal break-in expenses in connection with the new plant they had acquired from Studebaker in New Brunswick, New Jersey, things were beginning to work out, the new plant was operating satisfactorily, and the company was in no way in need of acquiring financial strength through merger or any other way. He told Mr. Allen that if there is any change in management's thinking with respect to a possible sale or merger, he would certainly advise the Chase of this immediately and would be very glad to discuss this with the Chase at that time.

[fol. 5812] Memorandum from Corporate Finance Department

June 23, 1958.

To: File
From: W. C. Huebner
Subject: Simplex Wire and Cable Company

An interview with John C. Toulmin, Senior Vice President of the First National Bank of Boston, was had Friday a.m., June 20. The meeting was arranged by F. W. Ohles through Donald L. Miller, Vice President, for the purpose of discussing Simplex Wire and Cable Co.

1st Boston is the banker for Simplex but, despite this, has relatively little information about either the company or its management. Everett Morss runs the company very tightly and does all the bank contact work himself. About nine months ago Toulmin suggested consideration of his estate problem and the need of establishing a market for the stock. At that time Morss was not interested.

Mr. Toulmin said that he would again contact Everett Morss on the desirability of obtaining a marketable security. If the reaction is favorable, he will then sound him out with respect to an exchange of stock with a good company. It is planned to do this the coming week (last in June) and advise me of the results.

Although Mr. Morss (age 58) is not now concerned about his estate, other members of the family are and this may have a bearing on Mr. Morss' outlook. Mr. Toulmin was advised of the confidentiality of our request and he agreed to respect it.

[fol. 5813] Memorandum from Corporate Finance Department

July 25, 1958.

To: File
From: Mr. W. C. Huebner
Subject: Triangle Conduit & Cable Corporation

On July 22nd I discussed over the phone with Schuyler Van Vechten, Director of Triangle, our interest on behalf of an unnamed client in the acquisition of Triangle. There was a Board meeting yesterday, July 24th, and Mr. Van Vechten brought this matter to the attention of the Board. He called this morning to give me the reaction of the Board.

It was unanimously decided not to pursue this possible acquisition. Incidentally, Van Vechten, who is Vice President of Lee Higginson Corporation, appears to be the only outside director on the Board. Both Mr. McAuliffe and Mr. Slater, Chairman and President respectively, are definitely not interested in being part of a large organization even though continuing to run Triangle as a subsidiary. The present management is very well satisfied with the company as it is now operating and much prefers to continue as an independent company.

After passing on this decision and reaction of the Board, Mr. Van Vechten went on to comment that the company sales for the first six months of 1958 were $26,000,000 vs. $28,000,000 for the first six months of 1957. Last year had been a very good year for the company with total sales of $56,300,000. However, a very good July and August are in prospect and the company expects to substantially better the 1957 results over the second half. Revenues for the full year 1958 are currently estimated by management at $65,000,000. The inference was given that Triangle could not hope to obtain a fair value for the company despite the favorable outlook during off year in the industry. Present book value of the stock is stated to be about $30,000,000 whereas management apparently feels it is worth $50,000,000. It may be that this wide discrepancy between management's thinking as to value and book value plays an important part in their reluctance to consider any merger possibility. I pointed

out to Mr. Van Vechten that we had participated in many merger and acquisition plans and that in all these fair value was the criterion for establishing terms rather than book value.

Although the Board had firmly refused any consideration of merging, Mr. Van Vechten thanked us for our interest in the company and said that he would definitely keep me informed of any change in management thinking.

[fol. 5814] Memorandum from Corporate Finance Department

July 22, 1958

To: File
From: W. C. Huebner
Subject: Triangle Conduit & Cable Corporation

This company has had close banking ties with the Chase Manhattan Bank ever since its establishment in Brooklyn in 1916, although it is now located in New Brunswick, New Jersey. Mr. John R. Lynch, Assistant Treasurer, Borough Hall branch, has been the officer in charge of this account for Chase Manhattan. Mr. Joseph G. Slater who was recently made President of Triangle is a friend of Mr. Lynch who contacted him in connection with our interest as to the availability of Triangle for acquisition. Mr. Lynch informed Mr. Slater that he was making this inquiry on behalf of Ebasco Services.

Mr. Schuyler Van Vechten, Vice President, Lee Higginson Corporation, is also a Director of Triangle and we were referred to him by Mr. Slater via Mr. Lynch. Mr. Slater also advised Mr. Lynch that management was not interested at this time in selling the company. This morning I called Mr. Van Vechten and outlined for him generally the conditions under which it was proposed to acquire Triangle and the criteria laid down by our client in selecting a company for acquisition. These were:

—Competent management of high integrity.
—A well engineered product of high quality.
—Our client was not experienced in this field and it was essential that present management of Triangle would continue to run the company and be satisfied with any arrangement.
—Our client preferred that the acquisition be made through an exchange of stock.
—Our client is not looking to make a bargain acquisition. Wanted to arrange a fair deal for Triangle. However, it was essential that the deal be fair also to our client.

Mr. Van Vechten said it would be difficult to obtain any decision without knowledge of our client. He did agree, however, that it may be possible to determine if there was any interest on the general grounds outlined to the point of willing to discuss terms of a sale. At this point our client would be willing to disclose itself but for good reasons did not wish it known that it was seeking such a company until such time as it was necessary to do so.

Mr. Van Vechten indicated that 1958 sales would be on the order of $65,000,000 versus 1957 sales of $56,000,000 and inquired if our client was of sufficient size, say sales in excess of $100,000,000 a year, to be able to acquire Triangle. I told him that they were and its resources were sufficient to acquire Triangle for cash if such would seem necessary. Mr. Van Vechten opined that our client obviously was big enough.

There is to be a board meeting of Triangle on Thursday, July 24. Mr. Van Vechten will discuss this proposal at the board meeting and will advise me on Friday, July 25 as to reaction of the board.

[fol. 5815] Memorandum from Corporate Finance Department

July 24, 1958.

To: File
From: Mr. W. C. Huebner
Subject: Walker Bros. of Conshohocken, Pa.

On May 27, 1958 Mr. John Rae visited his friend, Donald P. Horsey, Vice President of the Philadelphia National Bank and Manager of the Conshohocken branch, for the purpose of discussing Walker Bros., its management and the possibility that it might be available for acquisition. As a result of this meeting it appeared that an offer might be entertained by the owner-management. On July 10th I talked to Mr. Horsey more specifically and told him that a client of ours was definitely interested in acquisition through an exchange of stock of Walker Bros. Mr. Horsey is an outside director of Walker Bros. and has had a long business and personal association with the Company and the Walker family. He suggested that this matter be broached to the Board of Directors at the next meeting on July 22nd.

The decision of the Board was discussed with Mr. Horsey over the telephone today. In short, management is not now interested in any offer, no matter how favorable, involving the sale of the Company. Mr. Hervey S. Walker, Chairman of the Board, and his family are the sole shareholders of this Company. Despite the fact that he is 79 years of age he does not feel the need of establishing a market for his stock and feels that his estate is in good order. Mr. Horsey is of the opinion that this was a very firm refusal on the part of Mr. Walker but that other factors, such as any failing health on Mr. Walker's part, might change his viewpoint.

January 9, 1959.

Memorandum from
Corporate Finance Department

To: F. C. Gardner
From: R. L. Schlesinger
Subject: Summary of Alcoa Assignment

On May 19, 1958, the Aluminum Company of America asked for assistance in acquiring a company in the utility electric cable field. The Alcoa officials who came to New York and made the request were Ralph V. Davies, Vice President, Director and General Sales Manager, and Phil Coffin, Manager of the Utilities Sales Division. Later, in Pittsburgh, Frank L. Magee, President, and Matt Stanley, Assistant Treasurer were met also.

Certain criteria were laid down to guide our investigation:

Company must serve the utility industry
Product line be well engineered
Quality of production of high standard
Management must be compatible with Alcoa's, capable and of high integrity
Management to remain with company
Prefer acquisition through an exchange of stock and must obtain control, preferably 100%
If possible, location to be near Ohio River
Not interested in companies already affiliated with other primary metal producers

Phase I—Industry Pattern

The industry was studied to determine the companies engaged in this business and their relative position. There are about 120 companies in the field, including many subsidiaries and divisions of integrated metal companies.

Phase II—Selective Study

Upon completion of Phase I, a meeting was held with the client and a group of companies was selected for further review. Analysis was made in particular to determine their reputation as to technical ability and quality of management, financial position, and general availability. These companies were, in order of preference by Alcoa:

1. Okonite Company
2. Simplex Wire & Cable Co.
3. Triangle Conduit & Cable Corp.
4. Walker Brothers
5. Kerite Company
6. Crescent Insulated Wire & Cable Co.

Most of the other companies in the field, other than Rome Cable and General Cable, were either very small, divisions of integrated companies, or did not possess attractive fea- [fol. 5818] tures. Rome Cable was not included in the list because Alcoa had contacted it in October 1957. General Cable was also excluded because Alcoa was familiar with their management troubles and was averse to acquiring this headache.

Phase III—Approach

Okonite was selected for first approach. A. F. Metz, Chairman of the Board, was contacted. After considerable delay due to his nonavailability and other reasons, Metz agreed to a tentative meeting in late September of last year. Shortly prior to the meeting, it was announced that Kennecott was to acquire Okonite and this subsequently occurred. We believe that Okonite had an understanding with Kennecott while Metz was having telephone discussions with us.

Meanwhile our discussions with board members and bankers of the other companies had indicated lack of interest. Alcoa had acquisition discussions with Rome in 1957. They have recently been resumed. We have been in frequent contact with Alcoa during the current negotiations, and have furnished our preliminary views as to relative values and recommended course of action.

The death of the principal stockholder of Walker Broth-

ers of Conshohocken, Pa., occurred late last Fall. In December, we had discreet discussions with the trustee of the estate. Considerable time will have to elapse before further interest is developed.

We are in process of a second approach to Simplex of Cambridge, Mass. through the First National Bank of Boston. In the first approach Simplex was not aware of Ebasco's interest and John Toulmin, Senior Vice President of the bank simply discussed the possible sale of the Company with Everett Morss as a friend and banker.

At no time during any of our probing or discussing have we indicated that we represent Alcoa.

PLAINTIFF'S EXHIBIT 405

Memorandum from
Corporate Finance Department

August 12, 1958.

To: W. C. Huebner
From: R. L. Schlesinger
Subject: MEFA

Mr. Philip Coffin telephoned concerning the item in the Wall Street Journal today indicating that Okonite and Kennecott are close to a share for share stock swap. Coffin indicated that, while it, of course, might only be a rumor, they were very surprised and even shocked to read it. He would like Okonite to know that before they make any final move, Coffin's company would like to sit down and talk with Metz and his associates concerning this matter. They believe that their diversity of interests and products offer considerable to Okonite.

Coffin suggested that we contact Chase Manhattan to relay this on to Okonite.

Earle Allen, Vice President—Commercial Department of Chase, was on vacation so spoke to Rex Williams and Wal-

ter Dahmer. They promised to contact Metz of Okonite immediately and to report back to us no later than tomorrow morning.

Plaintiff's Exhibit 406

Memorandum from
Corporate Finance Department

October 17, 1958.

To: File
From: Mr. R. L. Schlesinger
Subject: Triangle Conduit & Cable Co., Inc.

Telephoned Mr. Davies of Alcoa today and gave him our views and steps taken concerning Triangle in the light of the Okonite acquisition by Kennecott.

On a previous contact with Triangle through Mr. Van Vechten, a Director of Triangle and a partner of Lee Higginson, we have been advised that Triangle was not interested in joining an integrated company (or any other company). Van Vechten was contacted by Mr. Huebner today to generally discuss the matter again. Van Vechten indicated that there might be some slightly increased interest on the part of Triangle but was not at all sure and would bring the matter up at a Board meeting which would be held before the end of October.

It was suggested to Mr. Davies that Mr. Huebner and myself visit McAuliffe and Slater, Chairman and President respectively of Triangle, at New Brunswick, N. J. to discuss the matter with them. This would be done after we are advised of the Board's views as indicated during their meeting this month. Van Vechten promised to telephone us after the meeting and prior to his departure for Europe around the 1st of November.

Davies agreed that it would be desirable for us to visit

the Triangle people. In the meantime he is expecting a visit on October 20 from representatives of Rome Cable basically on another matter but expects to discuss this same area of interest during the meeting. I mentioned to Davies that there would seem to be no objection in pursuing both companies at the same time and he agreed. I mentioned to Davies that in view of Alcoa's past problems with Rome that an independent study by Ebasco or some other firm might be desirable to speed any possible progress. Emphasized to Davies that this suggestion was by no means a promotional effort.

The way the matter stands now seems to involve a visit by Ebasco representatives to Triangle, if they are willing, sometime around November 1. Davies was advised that there might be a gap of some ten days before he hears from us again.

Memorandum from
Corporate Finance Department

To: File
From: R. L. Schlesinger
Subject: Rome Cable Corporation

Mr. Davies of Alcoa telephoned after his meeting today with Herbert Dyett of Rome Cable to advise us of what transpired at the meeting. Dyett is prepared to accept 8/10ths of a share for each share of Rome stock. He is leaving for Florida and would like Alcoa's views telephoned to him down there. Told Davies that in our judgment Dyett's offer was outside of any range of reasonableness. Davies said he was returning to Pittsburgh this afternoon and he would appreciate learning our progress on Triangle. Told him I would contact him as soon as possible and that in the meantime we would work up some figures on the Rome matter.

October 30, 1958.

W. C. Huebner received a phone call from Van Vechten, Director of Triangle. Van Vechten indicated that our approach to Triangle had been discussed at length at Triangle's Board of Directors meeting on Oct. 28. Triangle again indicated their lack of interest in this matter. Their confidence in their own future was indicated in the extra dividend (5¢) declared at the Board meeting.

Telephoned Davies and reported the status of the Triangle matter. Mentioned that although it is indicated that a further move in that direction in their behalf was inadvisable, it would not necessarily completely close it out indefinitely.

Discussed Rome matter again. Suggested that he give Dyett a fast answer indicating lack of interest in the 8/10ths offer but willingness to consider a reasonable offer. Davies

agreed completely and said he would telephone Dyett in Florida tomorrow. Davies believes Dyett's offer is a firm one and not subject to negotiation. Replied to him that he would have to be the best judge of this since he dealt with Dyett in person but it did seem to us that Dyett was maneuvering for at least the offer made by Alcoa a year ago (322,000 shares of Alcoa). Told Davies that based on the quick look we had made, in our judgment their previous offer was generous. Mentioned that of course we did not consider possible benefits to Alcoa through acquisition. Davies seemed to agree that their last offer was on the generous side.

Told Davies we had briefly looked into the matter from the standpoint of an offer ranging from 4/10th to 8/10th of a share. Within this range and using a price of 85 for Alcoa with 558,000 shares of Rome common stock outstanding, the following data were obtained:

[fol. 5825]

	Exchange Bases				
	.4	.5	.6	.7	.8
Shares Alcoa Issued (000)	223	279	335	391	446
Value @ 85 ($000)	18,955	23,715	28,475	33,235	37,910
Value pres. sh. Rome ($)	33.97	42.50	51.03	59.56	67.94
Return on Investment at $2 million earn. of Rome (%)	10.6	8.4	7.0	6.0	5.3
Alcoa div. requirement @ $1.20	268	335	402	469	535

Suggested to Davies that we approach Walker Bros. and Kerite in that order although both indicated lack of interest on previous contacts. Davies approved of this.

W. C. Huebner contacted Donald P. Horsey of the Philadelphia National Bank, the one outside director of Walker Bros. Horsey advised that Hervey Walker, Chairman of the Board of Walker Bros. and largest stockholder, had just died and that Horsey was named one of the trustees of his estate. He indicated that there probably would be no interest in any possible acquisition by another company—at least not for two years. He indicated further that Walker's estate was liquid and furthermore there are competent people running the company. This last development has not yet been reported to Mr. Davies.

ALUMINUM PRODUCERS AND IMPORTERS
MONTHLY REPORT OF RECEIPTS, SHIPMENTS, AND STOCKS

TO: Bureau of the Census, Washington 25, D.C.
ATTN: Industry Division

GENERAL INSTRUCTIONS

Two (2) copies of this report shall be filed at the above address each month, not later than the tenth (10th) day following the month covered by the report, by: integrated producers; non-integrated producers; smelters; other producers of secondary ingot, including reclaimers producing deoxidizing and chemical grades, and foundries which purchase and melt scrap; importers; foil fabricators; powder manufacturers; and forging companies. Distributors are not required to file this form. A report need not be filed for any month in which the total shipments are less than 10,000 pounds. In such case, please indicate by checking in the box following this paragraph and return the form without completing.

☐ Less than 10,000 pounds.

SPECIFIC INSTRUCTIONS

Section I - TOTAL RECEIPTS AND SHIPMENTS

Columns (c) and (d) - Receipts
Producers should report in thousands of pounds the weight of products listed in Column (a) which was received from imports and from other sources, separately, for use in producing products listed. Report metal actually received, including metal received under toll arrangements. If you operate both as a producer and as a distributor, receipts for resale should be excluded. Smelters should not include ingot from reclaimers as receipts of ingot. Smelters producing non-aluminum-base alloys, e.g. zinc-base, should not include as receipts the pig or ingot used in producing such alloys.

Column (e) - Shipments
Report in thousands of pounds the weight of products in Column (a) shipped to all customers, including shipments to outside companies and companies in which you have an interest; shipments within your company for fabrication beyond the shapes listed in Column (a); and shipments made under toll arrangements. Do not include shipments to GSA in Section I; but report these as a separate item in Section II. If you operate both as a producer and as a distributor, omit shippents of shapes purchased for resale. Report the product shipped in its most advanced form as listed in Column (a). Do not report as a shipment the stock you produce which is required to produce that product, for example, a company making both redraw rod and wire should report wire out not the redraw rod from which the wire was produced. A company making both forging stock and forgings should report forgings as shipments but not the stock from which the forgings were produced. Foundries purchasing and melting scrap should report as shipments the ingot equivalent of scrap purchased and used in the foundry operation.

Section II - SHIPMENTS ON RATED ORDERS

Columns (a) and (b) - Products and Product Code
Report product codes and designations of products shipped on rated orders, according to list in Section I. Companies supplying metal to foil producers, powder manufacturers and forging plants for military orders should not report rated shipments of such metal as A-E orders but as AF, AP, and Forging Stock orders, respectively; foil producers, powder manufacturers and forging plants will report rated shipments of their products as A-E orders.

Column (c) - Allotment Symbols
Show the allotment symbols (A-1 and 1-digit and AN numbers) used by your customers in placing orders against which you have shipped during the month. AN 9000 is the symbol used by distributors in replacing in inventory material shipped by them on rated orders. Show shipments to GSA as a separate item.

Column (d) - Shipments
Report the weight in thousands of pounds of each product shipped against individual ratings.

Section III - INVENTORIES OF SCRAP, PRIMARY PIG AND INGOT, AND SECONDARY INGOT

Report weight in thousands of pounds of inventories at end of month of (1) purchased scrap or scrap received on toll including ingot received from reclaimers, (2) primary pig and ingot, unremelted, (3) secondary ingot, including toll, unremelted.

Certification - The undersigned company and the official executing this certification on its behalf hereby certify that the information contained in this report is correct and complete to the best of their knowledge and belief.

[fol. 3830]

GENERAL INSTRUCTIONS

This report is required under the authority of Section 705 of the Defense Production Act of 1950, as amended.

1. Brass mills whose average monthly shipments of brass mill products (excluding shipments of intermediate shapes) was more than 200,000 pounds (metal weight) during the last six months of 1952 and copper wire mills whose average monthly shipment of copper wire mill products (excluding shipments of intermediate shapes) was more than 100,000 pounds (copper content) during the last six months of 1952 shall file a report on this form in *duplicate (2)* by the *15th* of the month following the period of report with the Bureau of the Census, Washington 25, D.C., Industry Division, REF: BDSAP-84.

2. This form shall be filed for each calendar quarter. The period of report is the calendar quarter just completed.

3. Shipments - Include all controlled materials orders shipped: by you for your own account; by other copper controlled materials producers for your account; or by you under toll arrangements for the account of controlled materials consumers. Include transfer of finished products from your company's mill to its fabricating plant(s). Exclude from this report actual shipments of controlled materials on toll basis to other producers of controlled materials. Also exclude transfer of products from your company's mill to mill stocks located elsewhere, for example, at depots. Include, however, shipments from your mill stocks at depots and warehouses to customers.

4. Unfilled Orders - Include all delivery orders for controlled materials (finished copper-base mill products as shown in paragraph 9 below) that have been accepted or acknowledged and have been scheduled for future production or delivery and for which controlled materials have not been shipped as of the close of business on the last day of the period covered by this report.

5. Unless otherwise directed by the Copper Division, companies operating more than one plant may file separate reports covering the operations of each plant, or may file a consolidated report covering all of their plants. Do not file both ways. If a company operates more than one plant, indicate under "name of company" on the report whether it is "individual" or "consolidated." Companies operating more than one plant are requested not to change method of filing without prior approval of the Copper Division.

6. Check (✓) in the space provided on the form the type of operation performed by your company.

7. In reporting weights, show total metal weight for all brass mill products; show copper content for wire mill products. Report all weights in thousands of pounds to the nearest thousand (000 omitted). *Example:* 6,849 as 7; 6,499 as 6; 720 as 1; amounts less than 500 pounds require no entry.

8. Do not include in this report copper raw materials, or brass mill or copper wire mill intermediate shapes. Include only brass mill products (including anodes, rolled, forged, or sheared from cathodes) and copper wire mill products, as listed in paragraph 9 below.

9. Separate information should be filed for each copper or copper-base alloy product that you produce. The following categories are classed as products for the purpose of this report.

Wire mill:
- a. Copper wire mill products.
  - Wire, uninsulated, bare, tinned, and/or alloy coated.
  - Insulated wire and cable:
    - Communication wire and cable.
    - Other insulated wire and cable.

Brass mill:
- a. Copper-base alloy sheet, plate, rolls, and strip, including anodes; but excluding strip for capping and discing for military ammunition.
- b. Military ammunition cups and discs, brass (net weight).
- c. Copper-base alloy rod, bar, wire, and shapes.
- d. Copper-base alloy pipe and seamless tubing.
- e. Unalloyed copper sheet, plate, rolls, and strip, including anodes.
- f. Unalloyed copper rod, bar, wire, and shapes, including anodes; but excluding copper wire mill products.
- g. Unalloyed copper pipe and seamless tubing.

Abbreviated classifications appear on the Form as follows:

Brass mill:
- a. Alloy sheet.
- b. Military cups and discs.
- c. Alloy rod.
- d. Alloy tube.
- e. Unalloyed sheet.
- f. Unalloyed rod.
- g. Unalloyed tube.

SPECIFIC INSTRUCTIONS

SECTION I

SHIPMENTS - Delivery Orders

Column (b) - Total. - Report in this column for items 1 through 9 the sums of items in columns (c) and (d). These sums represent the total shipments made on Authorized Controlled Materials orders and on delivery orders other than Authorized Controlled Materials orders during the period of report in accordance with the classification of copper-base mill products in column (a).

Column (c) - Other than ACM Delivery Orders. Report in this column for items 1 through 9 all shipments made on non-ACM orders for copper and copper-base alloy controlled materials.

Column (d) - ACM Delivery Orders. Report in this column for items 1 through 9 the totals of all Authorized Controlled Materials shipments against DMS allotment numbers extended to you by your customers, by toll consumers of controlled materials and by distributors. Do not include orders that have been cancelled. Entries in this column for items 1 and items 3 through 9 shall be the totals for all data for allotment numbers for each "Product" in Section II.

Items 1 through 9 - Enter data on the appropriate lines according to the classification of mill products shipped. Brass mills will enter for item 2 the sum of data reported for items 3 through 9.

UNFILLED ORDERS - Delivery Orders

Item 10 - Unfilled Orders - Report on this line all delivery orders for controlled materials (finished copper-base mill products as shown in paragraph 9 under General Instructions) that have been accepted or acknowledged and have been scheduled for future production or delivery and for which controlled materials have not been shipped as of the close of business on the last day of the period covered by this report.

Column (b) - Total. Report in this column for item 10 the sum of data in columns (c) and (d).

Column (c) - Other than ACM Delivery Orders. Report delivery orders other than Authorized Controlled Materials delivery orders, that have been accepted or acknowledged and have been scheduled for future production or delivery and for which controlled materials have not been shipped as of the close of business on the last day of the period covered by this report.

Column (d) - ACM Delivery Orders. Report in this column for item 10 all ACM delivery orders that have been accepted or acknowledged and have been scheduled for future production or delivery and for which controlled materials have not been shipped as of the close of business on the last day of the period covered by this report.

SECTION II

1. Report in this section Authorized Controlled Materials Shipments. Enter opposite each allotment number in the appropriate "Product" column the total of all shipments of the "Product" bearing that allotment number.

2. ACM shipments bearing program identification symbols A,B,C,D, and E should be totaled for each "Product" and entered for appropriate items in column (d), Section I.

NOTE: You should not receive nor report those ratings with a DO prefix, such as DO-A-1. The DO prefixed rating applies to orders for products and materials other than controlled materials (see DMS Regulation No. 1.) DMS means Defense Materials System.

[Vol. 5833]

ALUMINA AND BAUXITE

By R. C. Wilmot[1]

ALUMINA (Al_2O_3), the raw material for producing aluminum, comprises one-seventh of the earth's crust. Although bauxite is the only commercial ore of alumina, other potential sources of alumina are almost unlimited.

SUMMARY

World consumption of alumina in 1958 was estimated at 8 million tons; nearly 57 percent was consumed in North America and 38 percent in Europe. The consumption of alumina in the United States in 1958 was about 3.9 million tons, and by 1975 annual consumption may be 12 million tons.

World bauxite production in 1958 was estimated at 20.7 million tons, of which 57 percent was produced in the Western Hemisphere. Over 90 percent of the bauxite consumed in the United States is used in alumina production and the remainder by abrasive, chemical, refractory, and other industries. Bauxite consumption in the United States was 7 million tons in 1958 and by 1975 consumption may be 25 million tons.

Although the United States produces essentially all of its alumina requirements and is the world's largest consumer of bauxite, less than 20 percent of its bauxite requirement is produced domestically. The domestic bauxite reserve, which occurs mainly in Arkansas, is estimated at 50 million tons averaging about 52 percent Al_2O_3. The reserve is too small to permit production to be expanded significantly. The total world reserve of bauxite at the end of 1958 was estimated at 3.2 billion tons, with the largest deposits in Guinea, Australia, Jamaica, Hungary, Ghana, and Surinam.

As a result of improvements in technology it has been possible to reduce the grade of ore used in alumina plants. In 1930 ores used in the United States averaged 60 percent alumina, but by 1958 ore averaging as little as 50 percent alumina was being used. The average grade of ore treated will probably continue to decrease gradually, and successful application of processes now being tested would result in some plants using materials containing less than 35 percent alumina.

Bauxite, an ore containing hydrated aluminum oxide minerals such as gibbsite, boehmite, or diaspore, is formed by weathering processes acting on alumina-bearing rocks. The largest deposits occur in tropical or subtropical climates and are at or near the surface. Most bauxite is mined by open-pit methods, but bauxite is also recovered by underground mining methods in the United States and in Europe.

Assurance of an adequate and dependable long-range supply of alumina requires discovery of new sources and the solution of numerous mining and metallurgical problems. A challenging problem is the development of a commercial process for producing alumina from domestic low-grade materials. Problems of the Bayer process include the need to improve its efficiency and development of methods for utilizing tailings. There is insufficient information on quantity, grade, and type of potential alumina resources, and exploration is handicapped by lack of a rapid method of analyzing for alumina. Mechanical beneficiation of low-grade bauxites is hampered by the high loss of alumina in removing iron and silica.

BACKGROUND

SIZE, ORGANIZATION, AND GEOGRAPHIC DISTRIBUTION OF THE INDUSTRY

World alumina consumption in 1958 was estimated at about 8 million tons, of which 40 percent was consumed in the United States, 38 percent in Europe, and 17 percent in Canada. Usually, alumina plants are in or near the consuming country. Most alumina production facilities of the world are owned by aluminum producing companies.

World bauxite production in 1958 was estimated at 20.7 million tons, of which 57 percent was produced in the Western Hemisphere. Major producing countries in the Western Hemisphere are Surinam, British Guiana, and Jamaica. Production was begun in Jamaica in 1952, and by 1957 that country was the world's leading producer with an output of 4.6 million tons.

The capacity and location of the United States alumina plants, their sources of bauxite, and the aluminum plants that consume most of the alumina production are shown in figure 1. Approximately 95 percent of alumina shipments in 1958 went to the aluminum industry; the remainder was shipped to abrasive, refractory, chemical, or other plants. Harvey Aluminum, Inc., when in full production, will import about 100,000 short tons of alumina a year from Japan.

Six alumina plants used about 93 percent of the bauxite consumed in 1958. The remaining 7 percent was consumed by about 150 widely distributed companies for abrasive, refractory, chemical, and other uses. Three of the four alumina producers are vertically integrated from the mine through production of semifabricated aluminum. The fourth company uses bauxite purchased from a foreign source. In 1958 six independent companies produced bauxite in the United States on a small scale, mainly for specialty uses. All ore from Alabama and Georgia, some from Arkansas, and part of the South American imports, which total approximately 600,000 tons a year, is consumed directly in the form of bauxite without passing through an intermediate alumina production stage.

Bauxite exports represented less than 1 percent of the new supply.

DEFINITION OF TERMS, GRADES, AND SPECIFICATIONS

Alumina is aluminum oxide, Al_2O_3, prepared by calcining $Al_2O_3 \cdot 3H_2O$ at approximately 2,000° F. Naturally occurring forms include corundum, emery, ruby, and sapphire. In the commercial form it is a fine white powder containing about 0.5 percent impurities. A typical analysis of alumina used in the production of aluminum follows:

Chemical composition:	Percent
Silica (SiO_2)	0.02
Iron Oxide (Fe_2O_3)	.02
Titanium dioxide (TiO_2)	.008
Phosphorus pentoxide (P_2O_5)	Nil
Potash (K_2O)	Nil
Sulphur trioxide (SO_3)	Nil
Soda (Na_2O)	.45
Calcium oxide (CaO)	.02
Lead (Pb)	Nil
Alumina (Al_2O_3)	Bal.
Ignition loss and water absorption:	
Loss on ignition (1,000° C.)	2.67
Water absorption (loss dry-basis)	3.16
Screen analysis (Tyler mesh):	
+48	Nil
−48+100	.5
−100+200	53.5
−200	46.0
−325 (wet on original sample)	12.0

Activated alumina is a highly porous and granular form of aluminum oxide having preferential adsorptive capacity for moisture from gases, vapors, and some liquids. When saturated, it can be reactivated by the controlled application of heat within the temperate range of 350° to 600° F. to drive off the moisture. It is used as a drying agent, catalyst, or catalyst carrier.

Tabular alumina, also Al_2O_3, is prepared by heating $Al_2O_3 \cdot 3H_2O$ to slightly below the fusion point of alumina (3,700° F.). It is used in refractories, in insulators, and as a filler in plastics.

Bauxite is the term used for ores containing monohydrate or trihydrate aluminum oxide minerals, used primarily in the production of alumina. Most of the aluminum oxide (Al_2O_3) is present as gibbsite, boehmite, or diaspore. Major impurities in the ore are iron oxides, aluminum silicates, and titanium oxides.

There are three types of bauxite. The Surinam or trihydrate type is mainly gibbsite ($Al_2O_3 \cdot 3H_2O$) and usually contains 50 percent or more alumina, 2 to 15 percent silica, and 5 to 15 percent iron oxide. The European or monohydrate ($Al_2O_3 \cdot H_2O$) type is composed of boehmite or diaspore. A typical European-type ore analyzes 55 percent alumina, 4 percent silica, and 10 to 20 percent iron oxide. The Jamaica or mixed type is a mixture of monohydrate and trihydrate minerals. It contains about 50 percent alumina, 1 to 2 percent silica, and 20 to 30 percent iron oxide.

Crude bauxite, or bauxite as mined, contains amounts of free moisture ranging commonly from 5 to 25 percent and, in domestic ores, averaging about 15 percent.

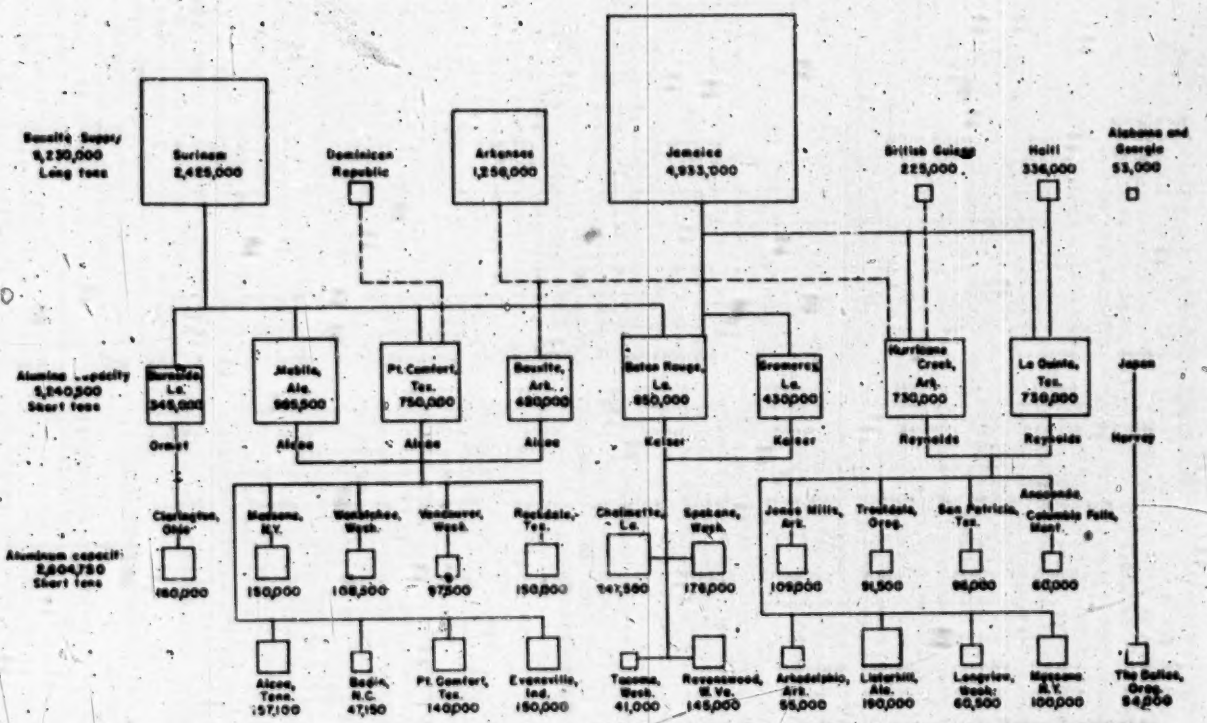

FIGURE 1.—Bauxite Supply and Alumina- and Aluminum-Plant Capacities in the United States in 1958 (Includes Plants Under Construction).

Bauxite specifications vary with plant and ultimate use. Table 1 gives the chemical analyses of bauxites used by the metallurgical, abrasive, chemical, and refractory industries. National stockpile specifications for all grades except chemical have been established (*3*).[1]

TABLE 1.—*Chemical analysis of typical bauxites by grade*

[Percent]

Grade	Al_2O_3	SiO_2	Fe_2O_3	TiO_2
Metallurgical	85-88	5-15	4-20	
Abrasive	Min. 85	Max. 5	Max. 6	Min. 2.5
Chemical	Min. 85-88	Max. 5-12	Max. 2	
Refractory	Min. 85-91	Max. 1.5-4.5	Max. 3	Max. 2.5

[1] Most of the remainder represents water of crystallization.

Red mud, the residue that results after alumina is extracted from bauxite by the Bayer process, consists largely of a complex sodium aluminum silicate and iron oxides. In the combination process the red mud is the feed to a subsequent lime-soda sinter step. The residue from the combination process is called brown mud or sinter mud and contains calcium silicates and iron oxides but little sodium aluminum silicate.

TECHNOLOGY

GEOLOGY AND EXPLORATION (*7*)

The commercial production of alumina is derived almost entirely from the hydrated oxides of aluminum contained in bauxite. Potential nonbauxitic sources are the aluminum sulfates such as alunite formed from hydrothermal solutions; the aluminum silicates such as the feldspars formed by igneous intrusions the aluminum silicates such as the andalusite-sillimanite series formed in schist belts by metamorphism; and the hydrated aluminum silicates such as clay formed in beds by the processes of weathering and sedimentation.

Bauxite is formed by the weathering of alumina-bearing materials such as feldspars or clays. Ideal conditions, most likely to occur in wet tropical or subtropical climates, are nearly continual rainfall, constant warm temperatures, and relatively good drainage over a long period of time (*1, 16*). The formation of hydrated aluminum silicates or hydrated aluminum oxides is strongly influenced by the degree of acidity or alkalinity of the weathering solutions. The Arkansas bauxite deposits were formed by weathering of nepheline syenite intrusions during the period between the formation of the Midway marine clays and the deposition of the Saline formation of the Wilcox group of continental sediments. Some later transported deposits were formed in the unconsolidated clays and sands near the syenite stocks.

Bauxite forms on a wide variety of rocks. European and Jamaican bauxites are frequently found in the sinkholes on the erosion surfaces of limestones. Indian bauxites are associated with basalts, and the bauxites of Western Africa and the Guianas in South America are associated with the weathering of schistose rocks. Many of the largest deposits are of the Pliocene or later ages and are covered by little, if any, overburden.

Prospecting is done along the unconformable surfaces on which the weathering interval was suitable for the formation of bauxite. There is no rapid method of chemical analysis for alumina, but differential thermal methods have been developed for quick approximations of the kaolinite and gibbsite content of samples.

Since bauxite forms by weathering, the ore body, which may be buried by normal geological processes, is usually nearly horizontal and close to the surface. Initial drilling is done at 400- to 4,000-foot intervals and development drilling at 50- to 200-foot intervals, depending on the depth and continuity of the deposit.

MINING

Open-pit mining accounts for 80 percent of the bauxite produced in the United States, also accounts for most of the bauxite produced in the rest of the world except Europe. In Arkansas, stripping is done by draglines, shovels, and carryalls. Stripping ratios of as much as 10 feet of overburden to 1 foot of ore are used and a ratio of 15 to 1 is considered feasible. Several pits in Arkansas have been mined to depths of more than 100 feet, and about 200 feet is estimated to be the present economic limit for large ore bodies. The pits stand well for unconsolidated rocks, but slumping does occur. Bauxite deposits in Jamaica lie at the surface, and stripping is limited to vegetation and topsoil (*11*). In Surinam, as much as 80 feet is stripped by draglines, hydraulic giants, or dredges (*22*).

Underground mining accounts for more than 80 percent of French bauxite production and is widely used in other parts of Europe including the U.S.S.R. European deposits frequently are in steeply folded limestone beds, and the ore-shoot pattern is typical of sinkhole deposition. Room-and-pillar or shrinkage stoping is used, depending on size, dip of the ore body, and condition of the back.

The flat-lying underground deposits of the United States are worked by room-and-pillar or longwall methods. The unconsolidated lig-

[2] Italicized numbers in parentheses refer to items in the bibliography at end of chapter.

nitic clays and sandstones of the back are weak and must be supported by a cap of bauxite about 2 feet thick. A modified longwall method, which retreats by mining diamond-shaped rooms along a cave line, has been developed by Reynolds Mining Co. for use in its Hurricane Creek mine in Arkansas. Using this method, average recoveries of the ore mined were about 80 percent, although in soft parts of the ore body recovery may be as low as 50 percent.

Restoration of mined-out open-pit areas to usefulness is required in Jamaica and is becoming increasingly important in other areas. Subsidence where bauxite was extracted underground is of minor importance today but may become more serious in the future.

BENEFICIATION

Bauxite is often washed to remove silica or clay minerals. The high-iron ores of Surinam are concentrated by jigging or heavy-medium separation.

In submarginal bauxites the iron oxides, clay minerals, and part of the titanium minerals are often so finely dispersed through the ore that physical methods have not produced successful separations.

During World War II a pilot plant was operated by the Bureau of Mines at Bauxite, Ark., to test various ore-dressing procedures, including gravity, flotation, and magnetic methods (*20*). Beneficiation by magnetic techniques to eliminate iron is practiced on a limited scale on bauxite for nonmetallurgical uses (*5*).

PROCESSING

Although research on the extraction of alumina has continued for many years, virtually all of the commercially produced alumina is obtained by a process patented by Karl Bayer in 1888 (German Patent 43,977) for use on bauxite. A number of modifications and improvements have been made in the process to adapt it to various types of bauxite. The process involves a caustic leach at elevated temperature and pressure, followed by separation of the resulting sodium aluminate solution and selective precipitation of the alumina. There are two principal variations of the Bayer process: (1) The European Bayer, in which the approximate conditions of leaching are a pressure of 210 p.s.i., a temperature of 390° F., a caustic concentration of 400 grams per liter, and a digestion time of 2 to 8 hours to effect solution of the monohydrate mineral boehmite; and (2) the American Bayer, in which a pressure of about 60 p.s.i., a temperature of about 290° F., a caustic concentration of 170 grams per liter, and a digestion time of ½ to 1 hour are used to dissolve the trihydrate mineral gibbsite (*3, 18, 19*). The American process is used for treating trihydrate bauxites, because it requires less evaporation and lower temperatures and is more adaptable to continuous digestion.

In both processes the pregnant solution is separated from the red mud tailings by countercurrent decantation and filtration. The liquor is cooled until it becomes supersaturated, then seeded with crystals of aluminum trihydrate. About one-half of the alumina in solution is precipitated in a 36- to 96-hour period. The precipitate is then filtered, washed, and calcined at 2,000° F. to obtain the final product. Caustic soda is regenerated in the precipitation step and, together with the unprecipitated alumina, is recycled to the digesters. For some nonmetal uses the alumina is left in the trihydrate form or is only partly calcined.

The finely divided residue resulting from leaching contains Fe_2O_3, TiO_2, and a complex sodium aluminum silicate compound. This compound represents a loss of soda and alumina, and the quantity discarded in the residue is related to the silica content of the bauxite. Approximately 1.1 units of alumina and 1.2 units of soda are lost for each unit of silica in the ore. Bauxite must contain less than 8 percent silica for economic treatment by the Bayer process.

Approximately 4 long dry tons of bauxite is required to produce 2 short tons of alumina, which will yield upon electrolysis slightly more than 1 short ton of aluminum. The materials other than bauxite required in the Bayer process are soda ash; lime for causticizing the soda ash; and fuel oil, gas, or coal (*2*).

Crude bauxite from the mines usually is crushed to about 2-inch size in hammermills, gyratories, or jaw crushers. Free moisture, but not the water of crystallization, is removed from the ores by drying when they are to be transported considerable distances. Bauxite from Surinam and British Guiana is dried to less than 3 percent free moisture. Bauxite from Jamaica and Haiti, after drying, may still contain as much as 15 percent free moisture to prevent dusting when the ore is transported. Further treatment depends upon the end use. Ores for refractory uses are calcined in rotary kilns at 2,500° to 2,900° F. and for abrasive uses at 1,700° to 2,400° F. to remove water of crystallization.

Bauxite with more than 8 percent silica is treated by the combination process (*3*), which first became commercial as a result of the reduced supply of imported high-grade bauxite during World War II. In this process, bauxite containing 12 to 15 percent silica is first subjected to a Bayer leach. The resulting red

mud, which contains the complex sodium aluminum silicate compound, is sintered with limestone and soda ash, then leached with water to recover alumina and soda. The brown mud residue has a composition, on a dry basis, somewhat similar to that of Portland cement.

The additional cost required in capital investment, raw materials, and processing by the combination method is partly offset by higher recoveries of alumina and soda and partly by lower mining costs. A major advantage of the combination process is the decreased need for selective mining, as high-silica bauxite, previously regarded as unsuitable for alumina production, can be used. The upper limit of silica for use in this process is now about 15 percent; however, in practice, bauxite containing as high as 25 percent silica is mined and blended with low-silica ore in proportions that will give a feed material of approximately 12 to 13 percent silica. The combination process is used in the two plants in Arkansas and in plants in the U.S.S.R. and China (*21*).

In 1952 the American Bayer process was modified to treat the high-iron, low-silica bauxite of Jamaica. The major modifications resulted from difficulties in filtration of the red mud slurry and from the small amount of boehmite in the ore (*19*).

In the U.S.S.R., alumina is extracted from nephelite flotation concentrate containing about 30 percent alumina, obtained as a byproduct of apatite from deposits in the Kola Peninsula (*21*). The process used is a variation of the lime-soda sinter method, but no soda is added as it is already present in the feed.

In Norway alumina is extracted commercially from high-iron bauxites by the Pedersen smelting process. In this process, bauxite, limestone, coke, and iron ore are smelted in an electric furnace to produce pig iron and a calcium aluminate slag containing 30 to 50 percent alumina. The slag is leached with sodium carbonate solution, and the alumina trihydrate is precipitated by carbon dioxide. During World War II the process was also used at a Swedish plant to treat andalusite.

During World War II the U.S. Government erected four demonstration plants to test the following alkaline and acid processes:

1. Laramie, Wyo.—Anorthosite calcined with limestone and soda ash; sinter leached with soda solution to extract sodium aluminate; alumina trihydrate precipitated by carbon dioxide and calcined to alumina (*23*).

2. Harleyville, S.C.—Clay sintered with limestone; sinter leached with sodium carbonate solution to form sodium aluminate; alumina trihydrate precipitated by carbon dioxide and calcined to alumina.

3. Salt Lake City, Utah.—Alunite roasted, then leached with sulfuric acid solution; alumina and potassium sulfate recovered from the alum.

4. Salem, Oreg.—Calcined clay leached with ammonium bisulfate to form an alum; converted to aluminum hydroxide and calcined to alumina.

After the war the plants were shut down before the processes had been adequately tested. In 1952 to 1954 the plant at Laramie was reactivated by the Bureau of Mines and successfully operated at an output of 30 tons of alumina a day. The cost of producing alumina from anorthosite or other aluminum silicates, at the rate of 1,000 tons a day, was estimated to be one-fourth to one-half again as much as the cost of producing alumina from bauxite.

By 1956 all the Government-erected plants had been sold to industry to be used for other purposes.

USES

More than 90 percent of the alumina production is consumed by the aluminum industry. Alumina also is used for abrasive, refractory, or chemical applications in which a high degree of purity is desirable. Its minor uses include production of the nose cones of missiles, artificial sapphires, and thread guides for textile plants.

Over 90 percent of the bauxite consumed in the United States is used by 6 alumina plants and the remainder by about 130 abrasive, chemical, refractory, and other plants. Fused bauxite is used in bonded or coated abrasives or as abrasive grain. Since 1949 the refractory industry has used increasing quantities of bauxite as a substitute for diaspore clays. Aluminum sulfate and other aluminous chemicals are produced from bauxite for treating water and sewage, dyeing, tanning leather, and sizing paper. Bauxite is also used in the production of high-alumina cement, in low-density insulating materials, as an adsorbent or catalyst by the oil industry, and as a flux in making steel and ferroalloys.

BYPRODUCTS

Most bauxites contain small quantities of gallium and vanadium, which dissolve in the Bayer process liquors. Gallium is recovered in the United States by one company, and vanadium is recovered in a French operation. In Norway iron is produced as a byproduct of the Pedersen process. In the U.S.S.R. potash, soda, and cement are produced as byproducts in recovering alumina from nepheline syenite.

RESERVES (*3, 7, 13, 21*)

The earth's crust averages 15 percent alumina, but the commercial ore (bauxite) usually contains more than three times this proportion.

The world bauxite reserve of 3.9 billion tons, as estimated in 1956, is shown by country in table 2. The reserve is sufficient to last 100 years at the 1956 rate of production.

The world-reserve figure has approximately doubled since 1950. Part of the increase resulted from an extension of areas under investigation. In Guinea, other parts of West Africa, Jamaica, and Australia discoveries have totaled hundreds of millions of tons.

The ability to use lower grade material has also resulted in lower cutoff grade and has been another factor in increasing estimates of reserves. As an illustration, ore used in the United States in 1950, whether of domestic or foreign origin, averaged about 60 percent alumina and 2 percent silica. By 1957 one-half the ore used in the United States contained about 50 percent alumina and at least one-fifth averaged 12 percent silica.

The United States bauxite reserve, totaling 50 million tons and averaging 52 percent Al_2O_3 and 10 percent SiO_2, is 97 percent in Arkansas and 3 percent in Georgia and Alabama.

The potential resources shown in table 2 are essentially bauxite and bauxitic clays that typically analyze 32 to 45 percent alumina. Other immense sources, not included in the table and containing less than 32 percent alumina, are nepheline syenite, anorthosite, clays, kyanite, and shales.

The United States potential resource includes bauxitic clays and bauxitic laterites. The resource of bauxitic clays, associated with the bauxite reserves in Arkansas, is estimated at 140 million tons with an average analysis of more than 35 percent alumina. Large deposits of bauxitic laterite in Oregon contain 35-percent alumina, less than 10 percent silica, and about 30 percent iron oxide.

Several hundred million tons of low-grade bauxitic laterite has been discovered in Hawaii on the islands of Kauai, Maui, and Hawaii. The Bureau of Mines and the Geological Survey have made preliminary studies to evaluate this material.

SOURCES OF STATISTICAL INFORMATION

Statistical information on stocks and production of alumina and shipments of alumina classified by recipient industry are collected annually by the Bureau of Mines. The Bureau also collects data on the consumption of alumina by the aluminum industry.

Statistical information on domestic bauxite is collected and published periodically by the Bureau of Mines and the Bureau of the Census. Other sources of information include special studies presented in the technical press, reports of aluminum producers and investment companies, and reports by other agencies such as the Federal or State Geological Surveys. The Bureau of Mines publishes quarterly reports and a comprehensive annual report.

Information on foreign bauxite consumption is almost wholly lacking, and data on alumina production and trade in foreign countries are incomplete.

PRODUCTION, CONSUMPTION, AND FOREIGN TRADE

Table 3 shows domestic alumina production and shipments to consuming industries by producers. From 1954 through 1958, shipments to the aluminum industry represented 95 percent of the total shipments. Before 1958, United States foreign trade in alumina was relatively small.

TABLE 3.—*Production and shipments of alumina in the United States, calcined equivalent*

[1] Consumption 1948–52; shipments 1953.
[2] Not available.

United States production, imports, and consumption of bauxite are shown in tables 4 and 5 and world production in table 6.

Exports of bauxite, 1949 to 1958, inclusive, ranged from 18,000 to 139,000 tons, averaging about 56,000 tons. The principal recipient was Canada, and part of the export was returned to the United States in the form of abrasives.

SELF-SUFFICIENCY

Before 1958 practically all the United States alumina requirements were met by domestic production. However, in 1958 one company with requirements of slightly more than 100,000 tons per year, representing 3 percent of United States needs, began importing alumina from Japan.

Table 4 shows United States self-sufficiency in bauxite for recent years. Since about 1920 there has been a declining trend in self-sufficiency, and by 1958 domestic production accounted for only 14 percent of the total new supply. The domestic reserve of bauxite is sufficient to maintain an annual production of approximately 1.5 million tons for several decades; any increase in demand must be supplied by imports.

TABLE 4.—*United States supply and self-sufficiency of bauxite*

[Thousand long tons]

Year	Domestic production (dry basis)	Imports (crude and dried) [1]					Percent self-sufficiency
		Jamaica	Surinam	British Guiana	Other [2]	Total

Surinam, Jamaican, and Refractory grade bauxites and crude aluminum oxide abrasives are in group I of the list of strategic and critical materials for stockpiling. Government stocks have been acquired, and at the end of 1958 the status of the inventories was as follows:

1. Surinam—quantity acquired substantially equals or exceeds the basic objective.
2. Jamaica—quantity on hand is sufficient to complete the basic and maximum objectives.
3. Refractory—quantity acquired substantially equals or exceeds the basic and maximum objectives.
4. Crude aluminum oxide—quantity acquired substantially equals or exceeds the basic and maximum objectives.

Abrasive-grade bauxite is listed in group II, and in 1958 none was under procurement.

DEFENSE PROGRAM

In order to meet the requirements of the aluminum industry, alumina plants were built by the Government during World War II. The construction of alumina plants was encouraged during the Korean hostilities through issuance of accelerated tax amortization certificates and guaranteed market contracts for aluminum.

During World War II, the bauxite reserve in the United States was more than doubled as a result of an extensive exploration program undertaken by the Federal government and industry. Other government programs assisted the sharp expansion in domestic bauxite production from less than 0.5 million tons in 1940 to an alltime high of 6.2 million tons in 1943. During the Korean hostilities, bauxite mining operations in Jamaica and Surinam were increased with government assistance.

PRICES AND COSTS

The cost of alumina at reduction plants in 1949 was reported as 3.48 to 3.65 cents a pound of aluminum (*18*). Since an average of 1.91 pounds of alumina is required to produce 1 pound of aluminum, the cost of alumina was about $36 to $39 a ton. The value of shipments of alumina and bauxite, as reported by producers, is shown in table 7.

The price of bauxite sold on the open market is largely based on alumina content and impurities present. As most bauxite is either consumed by the mining companies and their affiliates or purchased under long-term contracts, average quoted prices are not a reflection of a strongly competitive market but are largely nominal.

[3] Average value of shipments.
[4] 1958 only.

TAXES AND TARIFFS

A State severance tax of $0.10 per short wet ton is levied on bauxite mined in Arkansas. Bauxite produced in Jamaica is subjected to royalties and taxes totaling about $2, and in Surinam these total about $2.50 per long dry

ton. Domestic producers are granted a depletion allowance of 23 percent on income from domestic production and 15 percent on income from foreign production.

United States duties of 0.25 cent per pound of alumina used for producing aluminum, $0.50 per long ton on crude and dried bauxite, $1 per ton on calcined bauxite used for refractories, and 15 percent ad valorem on calcined bauxite for other uses were suspended for a 2-year period until July 16, 1960. The 0.25 cent per pound duty on alumina or aluminum hydroxide imported for other uses was not suspended.

TRANSPORTATION

Alumina produced in the South Central United States is transported usually in trainload lots, to the reduction plants. Freight to the Pacific Northwest is about $12 a short ton. Alumina is also transported by barge up the Mississippi River. The free-flowing properties of dry alumina are utilized when loading or unloading by hopper, conveyor, or pneumatic methods.

Approximately 60 percent of the world bauxite supply is produced in the tropics. The aluminum content of most of this ore is transported considerable distances in the form of ore, alumina, or metal to the principal markets in the North Temperate Zone.

Methods of transporting bauxite have been improved through development of such equipment as 35-ton trucks with heated bottoms to minimize sticking, aluminum gondolas, and ships and piers that are designed to make the greatest possible use of belt conveyors for loading and unloading. New shallow draft ships, which can navigate the Surinam rivers with a full load, do not require a stop at Trinidad to top off the cargo.

RESEARCH

During World War II an extensive research program aimed at developing methods for recovering alumina from low-grade ores was undertaken by the Bureau of Mines. Methods for upgrading low-grade bauxites (those with high-silica and/or high-iron content) were investigated. Acid and alkaline processes for extracting alumina were tested and the most promising methods investigated on a pilot-plant scale. During this period other Government and private organizations conducted research on similar processes.

Current Bureau of Mines research includes a fundamental study of the reactions in the alkaline sinter process, an evaluation of acid and alkaline processes to serve as a guide for further research, and a study of methods for upgrading Arkansas bauxites and recovering the alumina from Hawaiian bauxite and Oregon laterite. Research on mining techniques is underway in Arkansas.

All six companies producing aluminum have laboratories in which research is in progress on improving present processes for recovering alumina or developing methods for recovering alumina from noncommercial materials. Anaconda Aluminum Co. has built a 50-ton-per-day pilot plant for testing an acid process for recovering alumina from Idaho clays. North American Coal Corp. and Strategic Materials Corp. are investigating, jointly, an acid process for recovering alumina from low-grade ores and coal-mine wastes. In addition, studies at some laboratories are directed toward expanding the use of alumina by the refractory, abrasive, petroleum, and other industries.

ALUMINUM

By R. A. Heindl[2]

NAPOLEON III had tableware made of aluminum but he also recognized that such a light metal had military potential and through financial assistance encouraged experimental research on its production. Today tableware and military applications represent only a small part of the total aluminum consumption.

SUMMARY

The discovery of a commercial process for the electrolytic recovery of aluminum, late in the 19th century, opened a new chapter in the world's industrial history. Growth of the primary aluminum industry in the United States has been so rapid that the quantity produced annually now exceeds that of any other nonferrous metal. Since 1955 aluminum production in the United States has exceeded 1.5 million tons annually. Aluminum is of great importance in the aircraft industry, and efficient, competitive operation of many other industries requires a continued supply of the light metal.

The basic process for producing aluminum, developed independently by Hall and Héroult nearly 75 years ago, is by electrolysis of high-purity aluminum oxide in a bath of molten cryolite. Research in reduction cell design and development of larger cells has led to economies in power and manpower requirements. There has been much research on other processes for recovery of the metal, but none has proved more economical.

Except for a few years immediately before World War II the United States has been the world's leading producer of aluminum and accounted for more than 40 percent of world output in 1958. The output of Canada, the second largest producer, represented an additional 17 percent of the total. The capacity of the domestic primary industry has always been nearly equal to demand. For the past 10 years U. S. imports have accounted for an average of 12 percent of the total supply of crude and scrap aluminum; and 81 percent of the bauxite used in 1958 was imported.

The recovery of secondary aluminum, from 1954 to 1958, averaged 16 percent of the apparent consumption of primary and secondary aluminum. New scrap is the source of nearly 80 percent of the secondary metal recovered.

The primary aluminum industry expanded sharply under the impetus of World War II and the Korean hostilities—partly with the aid of Government funds and incentives. In 1940 there was one domestic primary aluminum producer, by 1958 there were six, three of which were completely integrated from the mine to aluminum fabricating plants. Much of the primary production is consumed in semifabricating plants owned by the producers.

Since approximately 20 percent of the cost of aluminum is electric energy, the aluminum industry has until relatively recent times, built plants near sources of low-cost hydroelectric power. However, since World War II, demand for power in industrially developed countries has increased sharply and competing industries can pay more than the aluminum industry for power. The domestic aluminum industry turned first to hydroelectric power, second to natural gas, then to lignite, and in 1957 new aluminum smelters were built near large coal deposits. Aluminum producers in many foreign countries have constructed plants in relatively isolated and thinly populated areas where hydroelectric power could be made available.

The progressive research, development, and sales policies of the aluminum producers have resulted in the displacement of many materials from their historical market by aluminum. The relatively stable price of aluminum has been an important factor in the increased usage of the metal. Industries which consume major quantities of aluminum are: Building and construction, transportation, consumer durables, containers and packaging, electrical equipment, and machinery and equipment. As applications for aluminum are developed and current markets are expanded, production and

[1] Italicized numbers in parenthesis refer to items in the bibliography at the end of this chapter. Alumina, bauxite, and the recovery of alumina from nonbauxitic raw materials are discussed in the Alumina and Bauxite Chapter.

[2] Assistant chief, Branch of Light Metals.

consumption of this versatile metal are expected to continue to expand at a greater rate than the national economy.

Maintenance of an adequate aluminum supply requires assured sources of alumina and electrical energy. Continuation of research on reactions in the electrolytic cell may result in a decrease in power and manpower requirements. Alloy and product research will lead to the development of new uses, such as automobile engine blocks, which would consume large quantities of aluminum.

BACKGROUND

Recognizing that alumina was the oxide of a metal, Sir Humphry Davy, in 1808, named the metal "alumium" which he later change to "aluminum." Later the spelling "aluminium" came into general use and is still used in many countries. In the United States the simpler spelling "aluminum" was adopted.

Davy's attempts to isolate the metal were unsuccessful, but in 1825 Hans Christian Oersted produced aluminum by treating aluminum chloride with potassium amalgam. Frederick Woehler, some years later, produced an impure powdered aluminum using potassium as the reducing agent. Henri Ste. Claire Deville, in France, using sodium metal as the reducing agent, produced the first commercial quantities of aluminum in 1854. Although much research was done on lowering the cost of the sodium, aluminum was never produced by this method at a price competitive with other nonferrous metals. In 1857 aluminum was $27 a pound and the price was reduced to $17 by 1859.

In 1885 less than 300 pounds of aluminum was produced in the United States, but the discovery of an electrolytic process in 1886 by Charles Martin Hall in the United States and independently by Paul Héroult in France opened the way for a new industry. Using this new process, by 1895 production had increased to 900,000 pounds and prices had decreased from $10 to $0.59 a pound. Now, nearly 75 years following the discovery of the process, equipment has undergone considerable change and refinement, but the Hall-Héroult electrolytic process still is used. In 1958, when primary aluminum production was more than 1.5 million tons, the price of ingot averaged 26.9 cents a pound.

Beginning in 1954 and continuing through 1958, production of primary aluminum in the United States has exceeded that of any other nonferrous metal. The United States has been the world's leading aluminum producer except during the pre-World War II period, 1934 to 1940, when for 5 years Germany was the leading producer. Since 1942 Canada has been the second largest producer. Estimates for 1958 indicate that production in the U.S.S.R. is approaching that of Canada.

The Aluminum Company of America (Alcoa), owning bauxite, alumina, and aluminum producing facilities, was the only domestic producer from 1886 to 1940.

SIZE AND ORGANIZATION OF INDUSTRY

At the end of 1958 the primary aluminum industry was composed of six companies. Three of these companies, representing more than 85 percent of the U. S. productive capacity, were vertically integrated from mining through production of semifabricated shapes.

Figure 1 illustrates the organization of the domestic industry and shows plant locations, capacity, and plants under construction at the end of 1958. Table 1 summarizes this information.

TABLE 1.—*Primary aluminum productive capacity by companies, Dec. 31, 1958*

Company	Number of aluminum reduction plants	Annual capacity, thousand tons	Percent of total
Aluminum Company of America (Alcoa)	7	798	36.4
Reynolds Metals Co.	6	601	27.4
Kaiser Aluminum & Chemical Corp.	4	537	24.5
Anaconda Aluminum Co.	1	60	2.7
Harvey Aluminum, Inc.	1	54	2.5
Ormet Corp.	1	144	6.5
Total	20	2,194	100.0

Harvey Aluminum, Inc. and Ormet Corp. (a subsidiary of Olin Mathieson Chemical Corp. and Revere Copper and Brass, Inc.) produced primary metal for the first time in 1958, but Harvey, Olin, and Revere produced semifabricated shapes from purchased ingot prior to that year.

At the end of 1958 the world capacity to produce primary aluminum, shown in table 2, was estimated as 4.9 million short tons.

TABLE 2.—*World primary aluminum productive capacity*

Country or continent	Annual capacity	
	Thousand tons	Percent of total
United States	2,194	45.2
Canada	885	17.6
Europe	767	15.8
Asia	108	2.2
U.S.S.R. and Iron Curtain countries	846	17.4
Others, including South America, Africa, and Australia	76	1.6
Total	4,854	100.0

PLATE 1.—Bauxite Supply and Alumina- and Aluminum-Plant Capacities in the United States in 1959 (Includes plants under construction).

GEOGRAPHIC DISTRIBUTION OF THE INDUSTRY

The aluminum reduction industry is a major consumer of electric power and uses approximately 3 percent of the domestic electric power generated. In order to maintain its competitive position, large quantities of low cost dependable electrical energy are a necessity for this industry. Before 1950 plants were built near sources of low-cost hydroelectric power such as the Niagara Falls area, the Tennessee Valley area, and the lower Columbia River area of the Pacific Northwest. However, aluminum consuming and other industries entered these areas, and in some instances the cost of power from new facilities was increased. Since 1950, in addition to situating plants in the limited number of places where new hydropower supplies became available, the industry has built several large plants where natural gas, lignite, or bituminous coal for thermally generated electric power are available. New plants in the Ohio River Valley are near the markets and can take advantage of lower water freight rates (*9, 11*).

As indicated by figure 1, alumina, the basic raw material for the primary aluminum smelters, is produced in the South Central United States in Arkansas, Texas, Louisiana, and Alabama. The reduction plants are more widely dispersed. See table 3.

TABLE 3.—*Geographic distribution of aluminum reduction plants*

Location	Number of aluminum reduction plants	Annual capacity, thousand tons	Percent of total
Pacific Northwest	8	699	31
New York, Ohio, and West Virginia	3	335	15
Arkansas and Louisiana	3	411	19
Alabama, Tennessee, and North Carolina	3	294	13
Texas	3	365	17
Total	20	2,104	100

Completion of new facilities under construction in 1959 will result in new capacity in Indiana and increased capacity in New York, Ohio, Texas, and West Virginia.

DEFINITION OF TERMS, GRADES, AND SPECIFICATIONS

Pig.—Metal as initially produced by a primary reduction plant, taken directly from the reduction cell and cast into a convenient form. Pig is cast in a wide variety of sizes but the usual commercial size is 50 pounds, with a 99.5 percent guaranteed minimum aluminum content.

Ingot.—A cast form suitable for working or remelting that has been poured from either a melting or alloy furnace. The common commercial size is 30 pounds and the aluminum content is 99.5 plus percent.

Potline.—A number of reduction cells or pots, usually 100 to 150, connected in electrical series.

Super-purity aluminum.—Contains a minimum of 99.99 percent aluminum.

Aluminum Alloys.—Generally divided into two major groups: Wrought and casting. Table 4 gives the chemical composition for two alloys of each type. Unalloyed metal usually contains 99.5 percent aluminum and small quantities of iron and silicon. Even when no alloying elements have been added, the quantity of impurities present has to be controlled carefully. Metal with over 99.5 and up to 99.85 percent aluminum is available at costs up to 3 cents per pound more than standard commercial metal. It is used where superior electrical conductivity or corrosion resistance is required. Purities higher than 99.85 percent are necessary for certain applications.

There are several acceptable methods of designating aluminum alloys. However, a 4-digit code for wrought alloys was adopted by The Aluminum Association in October 1954. The first digit indicates the major alloying ingredient. If the first digit is 1 the alloy has

TABLE 4.—*Chemical analysis of some aluminum alloys, in percent* [1]

Type and number	Cu	Fe	Si	Mn	Mg	Zn	Ti	Cr	Other elements	
									Each	Total
Wrought 1100 [2, 3]	0.20	Fe+Si 1.0		0.05		0.10			0.05	0.15
Wrought 2024 [4]	3.8–4.9	1.50	0.50	0.30–0.9	1.2–1.8	0.25		0.10	0.05	0.15
Casting 43	0.10	0.8	4.5–6.0	0.30	C.05	0.20	0.20		0.05	0.15
Casting 108	3.5–4.5	1.0	2.5–3.5	0.30	0.03	0.20	0.20			0.50

[1] Values are maximum unless shown as a range; aluminum is remainder.
[2] Aluminum minimum—99.00 percent.
[3] Replaces commercial designation 2S.
[4] Replaces commercial designation 24S.

a minimum aluminum content of 99.00 percent. Digits 2 to 8 in the first position designate copper, manganese, silicon, magnesium and silicon, zinc, and other element, respectively; 9 is an unused series.

If the alloy has a minimum aluminum content of 99.00 percent; the second digit indicates special control on impurities and the last two digits indicate the minimum aluminum content figures to the right of the decimal point. Thus, 1030 indicates 99.30 percent minimum aluminum content without special control on individual impurities.

When the first digit is 2 through 8, indicating a major alloying ingredient, the second digit indicates alloying modifications and the last two digits identify the alloy; usually by the commercial code number previously used to designate the same alloy. Thus, 2014, formerly alloy 14S, contains copper as the major alloying ingredient with no alloy modification.

Additional letters, O and F, and letters H and T with numbers, may follow the alloy digits and designate the temper of the alloy.

No uniform system has been adopted by the industry for designating casting alloys. These alloys may be designated by American Society for Testing Materials numbers, U.S. Federal Specifications, Society of Automotive Engineers, commercial, and individual company symbols.

TECHNOLOGY

PRIMARY ALUMINUM *(16, 17, 19)*

Primary aluminum is produced exclusively by the electrolysis of alumina in a molten cryolite bath. Purity of the alumina used must be greater than 99.0 percent. The electrolytic reduction cell consists of a carbon-lined box containing a pad of molten aluminum which serves as the cathode, a carbon anode, and an electrolyte of molten cryolite in which the alumina is dissolved. Small quantities of aluminum fluoride are used in the electrolyte to combine with Na_2O, an impurity in alumina, to form artificial cryolite, and the melting point of the bath is lowered by the addition of small quantities of fluorspar. The anode may be either one large block of carbon or a number of small blocks of carbon. The alumina is reduced to aluminum at the cathode, and carbon is oxidized to carbon dioxide at the anode. The overall reaction may be written:

$$Al_2O_3+2C \rightarrow 2Al+CO_2+CO$$

The carbon lining, which contains the molten aluminum, is built into a steel shell. Typical dimensions of the shell are 20 feet long, 10 feet wide, and 3 feet deep. It is lined first with refractory insulation. The insulation is then lined with carbon blocks, joined by carbon cement, or a monolithic lining is prepared by baking carbon paste in place. The carbon lining usually must be replaced after 3 to 4 years.

The carbon anodes are consumed at a rate of about 1 inch of vertical length per 24 hours of operation and the method of replacement is important in regard to overall costs. There are two methods of replacing anode carbon through: (1) Soderberg continuous anodes and (2) prebaked anodes.

In the Soderberg anode a reinforced rectangular steel shell, open at the top and bottom, is suspended above the furnace. Carbon paste or briquets of coke and pitch are added periodically as the anode is consumed. Current enters the anode through rows of pins inserted into the carbon mass either vertically or horizontally. The heat of the bath and the heat resulting from the electrical resistance of the carbon bake the paste or melt and bake the briquets so that at a point approximately 20 inches above the bath the carbon becomes a hard monolithic mass. The steel pins, in addition to conducting current, support the carbon mass. As the carbon descends through the hopper and is consumed, the lowest pins are periodically withdrawn and replaced at higher levels in the anode box. The optimum anode-cathode distance is maintained by raising or lowering, simultaneously, the pins which are baked into the lower part of the carbon block. Inasmuch as the pad of molten metal builds up at approximately the same rate as the anode is consumed this adjustment is usually made only when metal is withdrawn from the cell.

In the prebaked anode system sets of 16 to 24 prebaked carbon blocks are used. The size of the blocks varies from plant to plant; in one plant the blocks are 20 inches wide, 31 inches long, 12 inches high, and weigh about 400 pounds. The blocks are supported in the bath by steel stubs or rods which conduct the current to the carbon. These stubs are inserted into a hole in the top of the finished block and anchored in place by casting molten iron around the stub. The blocks are raised or lowered separately to maintain proper position with respect to the bath and are replaced individually as they are consumed (7).

The Soderberg system requires less labor and, with the exception of moving the steel pins, is a continuous method of feeding anode carbon. The prebaked system results in better electrical efficiency in the reduction cell but requires fabricating and rodding facilities not used in the Soderberg system.

The molten bath or electrolyte may be as deep as 14 inches, but the anode is usually only 2 inches from the pad of molten aluminum. The resistance of the bath is sufficient to maintain an optimum operating temperature of

950° to 1,000° C. At this temperature the alumina dissolved in the bath varies from 6 to 10 percent. When the alumina concentration drops to 2 percent, the electrical resistance of the cell increases sharply and the voltage drop across the cell increases from 5 volts to 30 or 40 volts. The phenomenon is known as the "anode effect." As soon as this condition occurs, the crust of frozen cryolite on top of the bath is broken and more alumina is added to the cell which then returns to normal operating condition.

Every 1 to 3 days the molten aluminum is removed from the cell by aspiration. Cast iron pots with airtight lids and downward sloping spouts are used. The molten metal is blended with other batches and then may be fluxed, alloyed, cast, or if the fabricating facility is nearby, transported molten to the fabricating plant.

Plants constructed since 1950 have much larger cells than were used in older plants. These cells utilize currents from 65,000 to 125,000 amperes, with the majority of plants having 80,000- to 100,000-ampere cells. The voltage drop across a single cell is 4.5 to 5.0 volts and across a potline 600 to 800 volts.

The larger cells require less manpower per pound of aluminum produced, but special problems are encountered in cells designed to use 100,000 and more amperes. The large currents cause powerful magnetic fields in the metal and bath, resulting in violent agitation. This agitation causes a fog of aluminum to be dispersed in the bath which increases the possibility of reversing the reduction reaction. Another detrimental effect is that the molten metal piles up toward the negative leads causing a variation in the anode-cathode spacing. Moreover, localized thermal effects may distort the carbon lining (*4*).

Current efficiency varies from 85 to 90 percent; losses are principally due to physical losses of metal and reoxidation of aluminum by carbon dioxide. Owing to the electrical resistance the voltage efficiency is only 40 percent with heat being lost by radiation, and in the exhaust gases, in tapped metal, and in electrodes removed from the cell. As a result the overall energy efficiency is about 35 percent. About 7.5 to 8.5 kw.-hr. is required in the cell per pound of aluminum metal produced. Total plant requirements are less than 10 kw.-hr. per pound.

Table 5 summarizes the raw materials used in producing one pound of aluminum.

To prevent pollution of the atmosphere, gases from the cells are passed through a collection system which removes alumina, carbon, and fluorides.

TABLE 5.—*Raw materials and energy required to produce one pound of aluminum*

	Unit	Quantity
Alumina	Pound	1.93
Cryolite	do	0.02–0.03
Aluminum fluoride	do	0.02–0.03
Fluorspar	do	0.003
Anode carbon	do	0.55
Cathode carbon	do	0.02
Electrical energy	kilowatt-hour	7.5–8.5

The relatively low tensile strength of commercially pure aluminum limits its use in heavy durable products. However, by alloying, cold rolling, or heat treating, aluminum alloys with strengths approaching those of mild steels have been developed. There are more than 100 commercially-available aluminum alloys and several new alloys usually are developed each year. The alloys offers a wide variety of combinations of mechanical strength, ductility, electrical conductivity, and corrosion resistance. A small addition of manganese increases the strength of wrought aluminimum. Magnesium and silicon, together or separately, give aluminum alloys with good corrosion-resistance and strengths. Copper and zinc are used to produce alloys with high strength-to-weight ratios. Small quantities of other metals such as nickel, chromium, titanium, and tin are sometimes added for grain refinement or to impart special characteristics.

The production of super-purity aluminum requires a second electrolytic step in which a cell, known as the Hoopes cell, with three molten layers is used. The bottom layer is the anode, a relatively impure aluminum alloyed with copper to increase its density. The intermediate layer in the conventional Hoopes cell is molten cryolite with barium fluoride added to give it a density greater than that of pure aluminum. The top layer, which serves as the cathode, is molten super-purity aluminum.

Direct smelting of aluminum-silicon alloys from clay has been investigated. High-purity clay is used to minimize contamination of the alloy by iron and titanium. An electric furnace with graphite electrodes has been used with a carbon reductant, which may be coke, charcoal, sawdust, hogged fuel, or mixtures of these materials. At operating temperatures pure aluminum would volatilize or react with oxides of carbon. This is prevented by the addition of silicon which alloys with the aluminum and promotes absorption of the aluminum vapors (*3*).

Methods for recovering commercial grade aluminum from Al-Si alloys have been investigated. Experimental procedures have included

leaching the alloy with a molten metal such as zinc in which the aluminum dissolves and the silicon and impurities are relatively insoluble. The zinc is then distilled from the dissolved aluminum. In the subhalide process a crude aluminum alloy is treated with $AlCl_3$ at approximately 1,000° C. to produce $AlCl$. The reaction is reversed by lowering the temperature; pure aluminum condenses and the $AlCl_3$ vapors are recycled.

Many other methods of recovering aluminum have been proposed (*8, 16*). Such processes include the treatment of alumina with aluminum sulfide and carbon at an elevated temperature; hydrogen reduction of alumina at pressures above 100 atmospheres and temperatures above 400° C.; reaction between alumina and aluminum carbide at 1,980° C.; and electrolytic reduction of complex alumino-organic compounds such as $NaF.2Al(C_2H_5)_3$.

SECONDARY ALUMINUM (3, 15)

Much aluminum scrap is processed into secondary aluminum ingot without preliminary treatment. New scrap requires little or no sorting, and manual sorting of old scrap is too expensive to be widely practiced. Scrap in the form of borings and turnings is dried and the oil removed by burning. Tramp iron is removed by magnetic separators. Dross and foil also usually require treatment before being melted. From 40 to 95 percent of the scrap is recovered as metal. Low recoveries are obtained from drosses and skimmings; high recoveries from segregated sheet and clips.

Most scrap is melted in 5- to 25-ton capacity reverberatory furnaces operated on a 24-hour cycle. Important advantages of this type of furnace are its ease of mechanical charging, low flux consumption, and a melt loss of only 2 to 5 percent. The molten aluminum is protected from surface air oxidation by a layer of flux, which usually contains sodium chloride, potassium chloride, and cryolite. Other salts which may be included are calcium chloride and sodium fluoride. The melt may be refined by passing chlorine gas through the molten metal or by using reactive salts such as aluminum fluoride or soduim silicofluoride in the flux. Nitrogen is introduced to degas the melt and bring the dross and oxides to the surface.

Some scrap processing plants have dust- and fume-collecting equipment. Electrostatic precipitators and Venturi scrubbers apparently are effective in removing volatile alkali chlorides and fluorides as well as particles of aluminum, magnesium, and silicon from the exhaust gases. In small, intermittent operations, furnaces may be in the open or poorly hooded and therefore can be contributors to air pollution (*1*).

Secondary smelters consuming aluminum scrap produce specification wrought and casting alloys. Casting alloys account for most of their production. Once the scrap has been melted alloying ingredients or primary aluminum are added to bring the melt to specification.

USES (5)

Aluminum is used in many products because of its low density, high electrical or thermal conductivity, resistance to corrosion, low neutron absorption cross-section, nontoxicity, malleability, reflectivity, nonmagnetic and nonsparking properties, or high strength-to-weight ratio. In many applications aluminum is in direct competition with copper, steel, magnesium, lead, wood, plastics, rock wool, or fiberglass.

Shipments of aluminum are usually divided into three major categories: (1) Wrought products, such as rolled, extruded and forged shapes, (2) cast products, and (3) products for dissipative uses in which the metal loses its identity as in its use as an alloying ingredient in nonaluminum base alloys, a deoxidizer in the production of steel, or in the production of aluminum chemicals. Net shipments, classified as wrought or cast products, are shown in table 6. In addition, nearly 325,000 tons of ingot was shipped to Government stocks in each year 1957 and 1958, and it is estimated that 100,000 tons has been consumed annually in dissipative uses.

More than 25 percent of the aluminum consumed domestically is used for construction in such items as siding, roofing, curtain walls, flashing, insulation, windows and screening, and builders' hardware.

The transportation industry is also a major consumer of aluminum accounting for more than 20 percent of total consumption. The high strength-to-weight ratio of aluminum makes it valuable in any carrier, but this factor has been most important in aircraft. In buses and truck trailers it often accounts for 15 to 40 percent of the total weight of the vehicle. Since 1945, railroad equipment manufacturers have greatly increased their use of aluminum for trim and accessories. A few "all aluminum" passenger and freight cars have been built.

During the 1920 decade a number of automobiles used large quantities of aluminum, but the price and supply of aluminum were such that as automobile production increased and steel technology improved, the use of aluminum in automobiles gradually decreased until 1946 when only about 7 pounds of aluminum were used per automobile. Since then, this decreasing trend has been reversed. In 1955 an

[1] Withheld because estimates did not meet publication standards of the Bureau of the Census owing to the associated standard error.

average of 30 pounds per car was used and the 1959 models contain an average of 57 pounds of aluminum per car. Major aluminum components in automobiles are pistons, automatic transmission parts, and trim. One automobile manufacturer in the United States late in 1959 began producing a car powered by an engine made largely from aluminum.

Only in the past 25 years have marine applications of aluminum become important. During this period alloys with high mechanical strength and high corrosion resistance have been developed, and the problem of bimetallic corrosion has been largely eliminated by proper insulation. Approximately 2,000 tons of aluminum was used in the superstructure, decks and deckhouses, stack enclosures, bulkheads, and lifeboats of the SS United States. Many small pleasure craft are fabricated almost entirely from aluminum.

More than 15 percent of the total quantity of aluminum consumed goes into consumer durable goods including refrigerators, air conditioners, washing machines, furniture, utensils, and small appliances.

Ten percent of the aluminum consumed is used in the electrical and communications industries. In most instances aluminum cable with steel reinforcing has displaced copper for cross country transmission lines. It is estimated that aluminum conductors account for 90 percent of all new transmission lines in the United States. Aluminum conductor is also used in urban distribution lines and service drops.

Aluminum containers and packaging including foil, caps and closures, and collapsible tubes account for nearly 10 percent of total aluminum consumption.

Its use in machinery and equipment, in the chemical and metallurgical industry, and miscellaneous uses consume approximately 20 percent of the total aluminum supply.

Super-purity aluminum has a number of applications including its use as a catalyst for producing high octane gasoline, as an electrical capacitor foil, and in consumer products such as automobile and appliance trim and costume jewelry.

SUBSTITUTES

Aluminum has replaced many materials that can now be considered as substitutes for aluminum. If aluminum supplies were curtailed, or the price increased, steel and stainless steel, magnesium, zinc, titanium, lead, copper, plastics, fiberglass, or wood could be substituted for aluminum in applications where these materials have been used previously. Steel, stainless steel, magnesium, and zinc can be substituted for aluminum in the automotive industry. Magnesium could replace aluminum for certain components in commercial aircraft, and stainless steel and titanium may replace aluminum in jet aircraft. Fiberglass, titanium, and wood may be substituted for aluminum in small boats. Copper could replace aluminum in electrical applications and lead foil or plastics could serve as substitutes in packaging.

The increase in aluminum consumption has resulted, in part, from the decrease in the price of aluminum in relation to other metals. Historically a 1 percent decrease in the ratio of the price of aluminum to the composite price of copper, lead, and zinc has increased aluminum consumption by 1.4 percent.

SECONDARY SOURCES AND RECOVERY

The recovery of secondary aluminum, from 1954 through 1958, as reported to the Bureau of Mines, averaged 16 percent of the apparent consumption of primary and secondary aluminum. The scrap from which secondary aluminum is recovered is designated as either "new scrap" or "old scrap." New scrap is generated from (1) fabricating operations such as alloying, stamping, forging, extruding, machining, and casting and (2) rejected semifabricated and manufactured items. Old scrap is aluminum that has been used in end products and is collected for metal recovery after the products are worn out or discarded. New scrap consumption and metal recovery data are based on quantities treated outside of the generating plant and do not include "run-around" scrap consumed in the generating plant.

New scrap is the source of nearly 80 percent of the secondary aluminum recovered. The relatively small recovery from old scrap reflects the fact that the aluminum industry is a new and growing industry. Moreover, the high ratio (4:1) of new to old aluminum scrap shows that old aluminum-containing products are not being replaced as rapidly as new ones are going into use. The tonnage of aluminum in use represents a growing reservoir of old scrap for the future.

Consumers of scrap aluminum are divided into four major categories: (1) Secondary smelters, (2) primary producers and fabricators, (3) foundries and miscellaneous manufacturers, and (4) chemical plants. The secondary smelters accounted for 72 percent of the scrap consumed from 1954 through 1958. During this period smelters produced an average of 270,000 tons of secondary aluminum ingot annually. Much of this was consumed in the production of castings.

As indicated by the data in table 7, small quantities of aluminum are recovered from nonaluminum-base alloy scrap and some of the aluminum recovered is consumed in the production of such alloys and also in aluminous chemicals.

RESERVES

Reserves and resources of bauxite are tabulated in the Alumina and Bauxite Chapter.

SOURCES OF STATISTICAL INFORMATION

Data on production, shipments, stocks, and value of primary aluminum are obtained monthly from all domestic producers by the Bureau of Mines. Alumina consumption is obtained annually. The Bureau also canvasses, on a monthly basis, secondary smelters and other scrap consumers to determine stocks and receipts of scrap from which monthly consumption is calculated. Production of ingot by secondary smelters is calculated from their monthly reports of stocks and shipments. Coverage of the secondary aluminum industry is estimated at more than 80 percent. Data on the operations of the members of the Aluminum Smelters Research Institute are obtained from that association. The data on both primary and secondary aluminum are published monthly and annually; the secondary data include an estimate for full coverage of the industry.

The Bureau of the Census collects and publishes monthly data on net shipments of aluminum wrought and cast products. The Bureau of the Census also obtains monthly information on imports and exports of all forms of aluminum. The 1954 Census of Manufacturers included statistics on employment, materials consumed, electric energy purchased, and expenditures for plant and equipment.

With the exception of 1 year, data on aluminum consumption are incomplete. In 1952, under the Controlled Materials Plan, aluminum suppliers were required to report quantities of metal shipped to different segments of the consuming industries. Since then The Aluminum Association has published, semiannually by percent, shipments of wrought products, sand castings, and permanent mold castings to different major uses, as reported by its members. Although coverage is limited to members of the Association which represent about 80 percent of the wrought products producers and a much smaller part of the casting industry, the breakdown for wrought products and sand castings is believed to be representative of the entire industry. The statistics on permanent mold castings are believed not to be representative of the entire aluminum permanent mold casting industry.

PRODUCTION, CONSUMPTION, AND FOREIGN TRADE

In 1900 aluminum was produced in only four countries, and output totaled 7,500 tons. By 1958 there were 25 producing countries having a total production of 3.9 million tons. The United States with a production of 1,566,000 tons accounted for 40 percent of the 1958 world total. Since 1900 the output of the domestic primary aluminum industry has increased at an average rate of 11 percent per year compared to an increase in the Gross National Product of 3 percent per year. From 1951 to 1956 domestic production doubled, and since 1954 aluminum output has been greater than that of any other nonferrous metal.

Figure 2 illustrates the increase in domestic aluminum production since 1940. Table 8 gives the sources of the U. S. aluminum supply, crude and scrap, during the decade 1949 through 1958.

From 1949 to 1958 imports have accounted for an average of 12 percent of the total supply of crude and scrap aluminum. Canada, which supplies much of the world with aluminum, accounted for more than 85 percent of the U. S. imports during the same decade. Only 1.4 percent of the total U. S. supply has been exported during the 10-year period.

[3] Includes 324,311 tons shipped to the Government.
[4] Includes 325,126 tons shipped to the Government.

World production of primary aluminum is given in table 9. In 1958 Canada was the second largest producer, but this position was being challenged by the U.S.S.R. The rapid growth of the U.S.S.R. industry is illustrated by the fact that construction of the first aluminum plant in that country was not started until 1930.

In mid-1958 domestic primary aluminum producers expressed concern over the increased availability of aluminum from the U.S.S.R. on world markets and the undiminished importation of aluminum to the United States when the domestic industry was operating at only 70 percent of capacity. By the year's end exports of aluminum from Iron Curtain countries to the free world had decreased to the normal level.

Statistical information on the consumption of aluminum in the United States by industries

or by end products is incomplete. Total apparent consumption of aluminum, calculated from primary production and primary producers' stock changes, net imports of crude, semicrude and scrap, and recovery from scrap, is shown in table 11. These consumption figures do not allow for stock changes at any consumption level, at secondary smelters, nor for metal going to Government stocks.

SELF-SUFFICIENCY

As indicated in the previous section an average of only 12 percent of the U. S. aluminum supply was imported during 1949 to 1958. The capacity of the domestic industry always has been approximately equal to the demand. Domestic supplies of economically competitive bauxite are limited, and bauxite imports in 1958 accounted for 86 percent of the total ore supply. (For further details see the Alumina and Bauxite Chapter.)

STRATEGIC CONSIDERATIONS

Aluminum is on Group I of the list of strategic and critical materials for stockpiling. Government stocks have been acquired, and at the end of 1958 the inventory approximately equaled or exceeded the basic and maximum objectives.

In view of the stockpile position, the fact that the major import source is Canada, the geographic dispersion of the industry, and a 35 percent increase in domestic production capacity since 1955, the strategic position of primary and secondary aluminum, exclusive of ore supplies, is good.

DEFENSE PROGRAM

Under the impetus of both World War II and the Korean hostilities, domestic primary aluminum capacity expanded sharply. During these periods (1941–45 and 1951–52) aluminum came under the Controlled Materials Plan and the metal was distributed under a system of priorities.

Primary production capacity was 245,000 tons in 1940 and owned by one company, Alcoa. By 1943 capacity was increased to 1,164,000 tons including 668,000 tons belonging to the Government and 80,000 tons owned by Reynolds. Peak wartime production of 920,000 tons was reached in 1943, and then as supplies exceeded demand, production dropped to a postwar low of 410,000 tons in 1946. After the war Government plants, which were not economically competitive, were sold and converted to nonaluminum uses. Those which could be operated competitively were sold to Alcoa, Reynolds, or Kaiser (then Permanente Metals Corp.). After disposal of the Government plants, domestic primary aluminum capacity was 680,000 tons.

The pattern of the industry was unchanged from 1946 until the Korean hostilities. From 1951 through 1954 inclusive, 613,000 tons of Government-aided capacity came into production. Expansion during this period differed from World War II expansion in that none of the facilities were owned by the Government and all were located near electric power sources, which would permit economic operation of the plants in peacetime. The Government issued accelerated tax amortization certificates and entered into market guarantee contracts with the companies. Market guarantee contracts with Aloca and Kaiser expired late in 1958, and the contract with Reynolds was scheduled to expire by mid-1959. The expiration date of the remaining contract with Harvey Aluminum, Inc., was indefinite, but it will probably end in 1963. During 1957 and 1958, under these guarantees, the three largest producers shipped 647,000 tons of aluminum to the Government.

PRICES AND COSTS

The aluminum industry's price policy probably has been an important factor in the rapidly increasing usage of the metal by many consuming industries. While prices of other major nonferrous metals have increased between 100 to 150 percent from 1939 to 1959, the price of aluminum ingot increased only 34 percent during the same period. The average price of aluminum ingot in 1925 was 28.2 cents a pound and gradually decreased to the World War II price of 15.0 cents a pound. The first increase was in 1948, but the 1925 price was not approached until August 1957 when the postwar high of 28.1 cents a pound was reached. At the end of 1958 the price of ingot was 26.8 cents a pound.

Primary aluminum prices are relatively stable. Sharp fluctuations in the supply-demand balance are reflected in changes in scrap and secondary ingot prices. When aluminum was in short supply in 1955, the average price of two widely used alloys produced from scrap was 5 cents a pound more than the price of primary ingot.

One company reported the following mill costs (in cents a pound of pig) for 1953 (*18*):

Raw materials (includes alumina at cost including transportation and alloying materials)	4.71
Energy (for reduction only)	2.93
Manufacturing costs	6.43
Total	14.07

Transportation costs on shipments of pig, general administrative expense, and selling expense brought the total cost to 16.20 cents a

pound of pig. The average price of pig in the United States in 1953 was 19.7 cents a pound.

TARIFF

The Tariff Act of 1930 established an import duty of 4 cents a pound on crude aluminum. This was reduced to 3 cents in 1939. Pursuant to the General Agreement on Tariffs and Trade the duty was reduced to 2 cents a pound in 1948 and to 1½ cents in June 1951. Further negotiations under the agreement in 1956 resulted in three periodic reductions to the 1.25 cents a pound tariff that became effective July 1958. At that time the duty on typical aluminum manufactures was 3.5 cents a pound plus 17 percent ad valorem.

TRANSPORTATION

Much of the aluminum produced in the Pacific Northwest has been shipped to consuming areas east of the Mississippi River. The proximity of the new plants in the Ohio River Valley to the consuming areas results in lower transportation costs. Movement of alumina, by rail, from the alumina plants in the South Central United States to the consuming plants in the Northwest and Northeast represents a considerable item of cost.

GOVERNMENT POLICIES

As described in the section, Defense Program, the Government, through direct financing or incentives, has encouraged expansion of the aluminum industry from the mine through semifabricating facilities. Government programs have focused on promotion of a competitive industry and have resulted in the entry of new producers and assured that part of the production from new facilities will be made available to nonintegrated consumers of crude aluminum. Government policies relating to the development of power in agricultural areas have also had a profound effect on the formation and location of the industry.

RESEARCH

To hold markets won by displacing traditionally used materials and to continue to expand into new fields and applications, the aluminum industry, in 1958, spent more than $25 million on research and product development. This expenditure included research on bauxite and alumina production and utilization.

Industrial research covers the entire field of metal production, from the reduction cell, through the development of alloys and casting techniques, the study of protective and decorative finishes, and detailed investigations of end use applications of the metal. The producers develop technical data for their own use, as well as for the use of their customers.

Over the years, intensive efforts to improve the efficiency of the reduction step have resulted in significant decreases in power and manpower requirements. In 1938 power requirements were 10 to 11.5 kw.-hr. per pound of metal produced. Plants built since 1950 require only 7.5 to 8.5 kw.-hr. per pound. Manpower requirements have decreased from nearly 100 manhours per ton in 1939 to 24 manhours in 1954.

The industry's continuing alloy research program has resulted in the development of alloys with increased strength at elevated temperatures, increased electrical conductivity and improved corrosion resistance. Anodizing processes have been developed to protect and color aluminum surfaces. Methods of surface treatment and new basic materials have been developed in recent years to increase the commercial application of aluminum products protected by vitreous enamels.

From 1955 to 1959 the aluminum industry directed a major part of its end product development effort toward the automotive industry. The success of the effort was shown by the increased use of aluminum in automobiles and recent adoption of an air-cooled aluminum engine by one manufacturer. Applications in architecture and home building and packaging and containers also have been the subject of intensive investigation.

The Bureau of Mines at the Northwest Electrodevelopment Experiment Station, Albany, Oreg., began research late in 1951, under a cooperative agreement with Apex Smelting Co. of Chicago, to develop a smelting technique for producing aluminum-silicon alloy in a 3-phase ferroalloy-type arc furnace. A mixture of hogged fuel and coke proved to be promising as a reducing agent. Based on the work at Albany, the National Metallurgical Corp., a subsidiary of Apex Smelting Co., installed a commercial-size furnace for the production of silicon at Springfield, Oreg.

Subsequently, the Bureau conducted independent smelting research on the use of wood chips and coke in an arc furnace to smelt aluminum silicates containing 20 to 55 percent alumina, as a means of recovering aluminum from nonbauxitic sources. The early phases of this research have been described (*3*).

The Bureau of Mines was also investigating methods for producing commercial-grade aluminum from the crude aluminum-silicon alloys made by carbothermic reduction of domestic clays. One method involved leaching the crude alloy with molten zinc to selectively dissolve the aluminum, which was then recovered by distillation of the zinc.

The Bureau has also initiated research on the

fundamental physical chemistry of fused salt electrolysis in the aluminum reduction cell. The cathode and anode processes in the electrolysis of the fused cryolite bath were being studied and pertinent physical, chemical, and thermodynamic data obtained.

COPPER

By A. D. McMahon[1]

COPPER has been associated with the progress of civilization since prehistoric times, possibly as long ago as 6000 B.C. However, the acceleration in growth of world demand from 10,000 to 4 million tons annually has occurred in the past 150 years as a result of the development of electrical power and expansion of the brass and bronze industry.

SUMMARY

The progressive expansion of copper production in the United States began with the discovery of large deposits of native copper near Lake Superior in Michigan about 1845. Extensive ore bodies were found in Arizona, Montana, New Mexico, and Utah in the last half of the 19th century, and today the mining districts in these States account for approximately 85 percent of the Nation's mine production, which grew from 730 tons of recoverable copper in 1850 to about 1 million tons annually since 1955.

Copper mining, smelting, and refining in the United States are largely controlled by 4 companies; and, of the 30 large fabricators of raw copper, the plants handling over 50 percent of the total volume of business are owned or controlled by the large copper producers. They have completely integrated operations from the mines to the finished copper and copper-alloy products. The large copper deposits outside the United States are similarly controlled; Chile's production is derived mostly from three mines owned by two American companies; Northern Rhodesia's output comes from four large mines; one company controls Belgian Congo's several mines which are worked as a unit; and three mines account for nearly three-quarters of Canada's output.

Copper ores occur in many types of deposits associated with igneous, sedimentary and metamorphic rocks. Porphyry copper deposits make up most of the world's reserve and are mined principally by open-pit or block-caving methods. In 1958 open-pit mining accounted for 76 percent of the ore mined and 71 percent of the copper produced in the United States.

Most of the present copper production is derived from sulfide ores beneficiated by flotation. This process has been highly perfected for the sulfide minerals, but only a measure of success has been attained on copper carbonates, and flotation of the copper silicates remains to be solved.

Smelting sulfide concentrate involves producing a matte and slag in a reverberatory furnace and then oxidizing the sulfur and iron in the matte in a converter to release copper metal. Impurities in the copper are removed by electrolytic or fire refining.

Leaching followed by cementation or electrolysis is the process used to recover copper from oxide ores—carbonates and silicates. Recovery of copper from mixed oxide-sulfide ores is more difficult but is accomplished by ferric sulfide leaching or leach-precipitation-flotation. About 9 percent of the U.S. production of copper comes from ores treated by hydrometallurgical methods.

Copper is widely used because it has high electrical conductivity, high heat conductivity, good corrosion resistance, and because it is strong, yet malleable and ductile and can be alloyed readily with many other metals to acquire or impart desirable characteristics. Nearly half of the copper consumed is used in virtually pure metallic form, primarily by the electrical industry in manufacturing generators, motors, electric locomotives, switchboards, telephone and telegraph equipment, light and power lines, and other items. Most of the remainder is used in manufacturing brass, bronze, and other copper alloys. During war, copper's chief uses are for military materiel requirements and for essential industrial production. Aluminum serves as a substitute for copper and its alloys in a number of electrical, mechanical, and decorative applications; stainless steels, copper clad metals, and plastics have also replaced copper for some uses.

Progress in conservational practices have been made possible by technological advances in mining, metallurgy, and equipment design. One of the most important measures is the reclamation of copper from scrap that provides nearly one-fourth of the U.S. supply.

[1] Commodity specialist.

In the United States the price of copper quoted by the principal producers fell from an alltime high of 46 cents a pound in July 1956 to 25 cents in January 1958. The quotation moved up 1½ cents in July 1958, indicating some market strength. Reestablishment of the copper excise tax July 1, 1958 and effective cuts in mine production halted the decline in price. By October 24, copper was quoted at 29 cents.

Mine production in 1958 was at the annual rate of 979,000 tons. Production and consumption of copper usually follow the general trend of the economy. Planned expansion at established mines and development of new properties continued, indicating that producers are confident in the long-term outlook for an increased demand. Consumption of new copper in the United States is expected to parallel population increase. Copper consumption for new uses will be offset by further encroachment of aluminum and other substitutes. Reports of planned foreign power projects, industrial expansions, and development of backward areas indicate substantial future increases in foreign requirements for copper.

The major problems facing the copper industry today are in the marketing and utilization fields, which involve development of new uses, price, competitive metals, competitive foreign production, and conservation in mining and processing.

The United States has been the largest copper producing and consuming country in the world for many years. Before World War II, production exceeded domestic consumption, but the large war and postwar requirements resulted in a prolonged shortage even though about one-fourth of the total supply was provided by imports. Spurred by Defense legislation, the principal producers increased capacity to reach a supply-demand balance in early 1956. A downturn in U.S. demand beginning about the middle of 1956 led to cutbacks in mine production in 1957 and 1958 to equalize output with consumption. There was no slackening in foreign demand however, and world production reached an alltime high in 1957.

Chile, Canada, Mexico, Peru, Northern Rhodesia, and the Belgian Congo provide approximately 85 percent of the U.S. receipts of foreign copper. The copper excise tax which had been suspended by Acts of Congress since April 30, 1947, except for a short period (July 1, 1950–April 1, 1951), became effective July 1, 1958 at 1.7 cents per pound. Because of the easier supply situation, export controls on refined copper were removed in September 1956, and 1958 exports rose to the highest level since 1929.

The world reserve of copper, in terms of metal content, is estimated at 170 million tons of copper. The principal resources accounting for 93 percent of this total are in 7 countries: Chile, Peru, United States, Northern Rhodesia, Belgian Congo, U.S.S.R., and Canada. The large quantity of copper in use and recoverable in the form of scrap provides an additional dependable reserve of available copper; in the United States this source is estimated to be about 30 million tons.

BACKGROUND

Copper was probably the second metal used by man, gold was the first. The very early history of copper is obscure, but according to the theories of some archaeologists and anthropologists, its first appearance was associated with the Neolithic civilization during the late Stone Age. Discovery is believed to have been about 6000 B.C. The early age of copper probably had its greatest development in Egypt. Definite records have been found of the working of the copper mines on the Sinai Peninsula by King Seneferu about 3800 B.C., and the discovery of crucibles at these mines indicates that the early art of extracting the metal included some refining.

Little is known about ancient copper mining, although it is certain that both open-cut and underground mining was practiced. The most important copper-ore deposits were in Sinai, Syria, Baluchistan and Afghanistan, Caucasia and Transcaucasia, the Taurus region, Cyprus, Macedonia, Iberia, and Central Europe. The copper in use among the Sumerians of southern Mesopotamia (3500–3000 B.C.) was obtained from Asia Minor (where certain ores contain the same impurities as are found in metal relics) which also supplied the Assyrians much later. The production peaks in this region fall between 2400–2000 B.C. and 1500–1200 B.C.

Copper was worked in many parts of Egypt from Dynasty III (2800 B.C.) onward. About 10,000 tons was produced over 1,500 years; thereafter Egypt became dependent upon imports from Cyprus and Armenia. In Cyprus, copper mining began about 2500 B.C. The mines were operated successively under the dominion of the Egyptians, Assyrians, Phoenicians, Greeks, Persians, and the Romans. The same deposit produced 37,000 tons of copper in 1958.

European copper mines belonging to the Bronze Age are known in Austria, Germany, France, Spain, Portugal, Greece, and Tirol (Tyrol). In Tirol, the mines of Mitterberg

seem to have been worked from about 1600 B.C. in the Bronze Age to the Hallstatt period of the Iron Age, about 800 B.C. Probably the most important copper deposits in Europe were those of Spain and Portugal including the outstanding Rio Tinto ore body which is still being mined. In Britain copper deposits found in Anglesey, Cornwall, Devon, and Shropshire are of historical interest, having been developed by the Romans after the great invasion of 43 A.D.

The Copper Age in the Americas probably dawned between 100 and 200 A.D. Although some bronze appeared about this time in South America, a so-called Bronze Age was not evident, and both North and South America passed more or less directly from Copper into the Iron Age. Copper was first produced in the American Colonies in 1709 at Simsbury, Conn.; the Spaniards are credited with finding the copper-producing area of southwestern New Mexico about 1800; and a significant ore body (Ely mine) was discovered in Orange County, Vt., in 1820. However, it was not until after the discovery of the Northern Michigan ore deposits in the early 1840's that production in the United States exceeded a few hundred tons a year. Extensive ore bodies were found in Montana and Arizona during 1860–80. Smelter output from domestic ores increased from 728 tons in 1850 to 30,240 in 1880. The first of the large low-grade porphyry ore bodies, at Bingham, Utah, was brought into production by the Utah Copper Co. (later absorbed by the Kennecott Copper Corp.) in 1906. The ore dressing methods and procedures of flotation that were developed to process successfully tremendous quantities of low-grade copper ores encouraged search for and development of other porphyry deposits that account for most of the domestic copper reserve.

SIZE AND ORGANIZATION OF THE INDUSTRY

The value of copper output in the United States is second only to iron among metals. The United States has been the largest copper-producing country in the world since 1883, except for 1934 when Chile ranked first. In 1958, the United States produced 26 and 25 percent, respectively, of world mine and smelter production. Other principal copper-producing countries were Chile, U.S.S.R., Northern Rhodesia, Canada, and Belgian Congo in that order. Countries of the western hemisphere produced 53 percent of the world's total mine output.

The primary copper industry of the United States is composed of approximately 200 companies engaged in the production and sale of copper. The principal segments of the industry—mining, smelting, refining, fabricating, and marketing—are dominated in varying degrees by a few large vertically integrated companies.

Twenty-five mines produced 97 percent of the domestic copper output in 1958; the 5 largest produced 52 percent, and the 10 leading mines furnished 76 percent. The balance was supplied by small copper mines and producers of other ores, which contained recoverable byproduct copper. Three companies, Kennecott Copper Corp., Phelps Dodge Corp., and The Anaconda Co., usually account for about three-fourths of the annual domestic mine production. Kennecott and Phelps Dodge are by far the largest producers and supply about 35 percent and 25 percent, respectively, of the total each year. The principal copper-mining companies in the United States in 1958 were:

Company	Recoverable copper content of ore mined (short tons)	Percent of U.S. total
Kennecott Copper Corp.	318,000	32
Phelps Dodge Corp.	253,000	26
The Anaconda Co.	113,000	12
San Manuel Copper Corp.	78,000	8
International Smelting & Refining Co.	42,000	4
White Pine Copper Co.	41,000	4
Miami Copper Co. (including Copper Cities)	31,000	3
Magma Copper Co.	31,000	3
Total, above companies	905,000	92
Total, United States	979,000	

Copper-smelting capacity (exclusive of the Lake smelters in Michigan) in the United States in 1958 totaled approximately 8.6 million tons of charge. Four companies control about 90 percent of this capacity. Copper-smelting companies and their approximate percentage of the total U.S. smelting capacity are:[1]

Company	Percent of total capacity (tonnage)
Phelps Dodge Corp. and Phelps Dodge Refining Corp.	31
Kennecott Copper Corp.	28
American Smelting & Refining Co.	13
The Anaconda Co.	12
International Smelting & Refining Co.[1]	4
San Manuel Copper Corp.	4
American Metal Climax, Inc.	3
Magma Copper Co.	3
Tennessee Copper Co.	1
Total	100

[1] A subsidiary of The Anaconda Co.

Lake-smelter capacity in 1958 totaled 157,000 tons, as follows:

	Short tons
Calumet & Hecla, Inc.	100,000
White Pine Copper Co.	45,000
Quincy Mining Co.	12,000

Electrolytic copper refining capacity in the United States in 1958 was about 1,762,000 tons. Three companies dominate this section of the copper industry and control almost 80 percent of the annual capacity.

Refining companies and their approximate percentages of the U.S. electrolytic refinery capacity in 1958 are:

Company	Percent of total U.S. capacity
American Smelting & Refining Co.	27
Phelps Dodge Corp.	27
International Smelting & Refining Co.[1]	14
Kennecott Copper Corp.	12
American Metal Climax, Inc.	8
The Anaconda Co.	8
Inspiration Consolidated Copper Co.[2]	3
Cerro de Pasco Corp.	1
Total	100

[1] A subsidiary of The Anaconda Co.
[2] 38 percent controlled by The Anaconda Co.

Kennecott Refining Corporation was constructing an electrolytic refinery near Baltimore, Md., in 1959, it will have an annual capacity of 200,000 tons.

About 10 percent of the primary refined copper produced in the United States is fire refined in Michigan, New Mexico, Texas, and New Jersey from crude materials produced in Michigan, New Mexico, and Arizona, and from foreign crude materials.

There are about 30 large copper fabricating companies in the United States making sheet, strip, wire, rods, pipe and other extruded and rolled shapes. Twelve of these companies handle over 50 percent of the total volume of business and are owned or controlled by the large copper producers, giving them completely integrated operations from the mines to finished copper and brass products. The following fabricating companies are controlled by these companies.

Fabricating company	Controlled by
Chase Brass & Copper Co.	Kennecott Copper Corp.
Kennecott Wire & Cable Division, The Okonite Co.	Kennecott Copper Corp.
American Brass Co.	The Anaconda Co.
Anaconda Wire & Cable Co.	The Anaconda Co.
Phelps Dodge Copper Products Corp.	Phelps Dodge Corp.
Revere Copper & Brass Co., Inc.	American Smelting & Refining Co.
General Cable Corp.	American Smelting & Refining Co.
Wolverine Tube Corp.	Calumet & Hecla, Inc.
C. G. Hussey & Co.	Copper Range Co.
New Haven Copper Co.	Tennessee Corp.
Titan Metal Manufacturing Co.	Cerro de Pasco Corp.
Lewin Mathes Co.	Cerro de Pasco Corp.

The larger independent fabricators not now controlled by the major producers include:

Bridgeport Brass Co.
Bristol Brass Corp.
Chicago Extruded Metals
Olin Mathieson Chemical Corp.
Mueller Brass Co.
Reading Tube Co.
J. A. Roebling's Sons Div., the Colorado Fuel & Iron Corp.
Rome Cable Corp.
Scovill Manufacturing Co.
Triangle Wire & Cable Co., Inc.
Volco Brass & Copper Co.

GEOGRAPHIC DISTRIBUTION OF THE INDUSTRY

Copper is widely distributed in nature, and almost every country has some copper-ore deposits; 22 countries each mined over 10,000 tons of recoverable copper in 1958, and about 20 other countries recorded some output. In spite of the wide distribution, there are relatively few large copper mining areas in the world.

Most of the copper produced in the United States comes from five Western States. Chile's production comes principally from three mines; Northern Rhodesia's output from four large mines; Belgian Congo's production from properties of one company, and three mines supply about 75 percent of Canada's output.

Concentration mills and smelters are usually near the principal mines and some process custom ores from smaller producers. There are eight smelters in Arizona; one each in Utah, Montana, Nevada, New Mexico, and Tennessee, one in Texas, and one each at seaports in Washington, New York, and New Jersey.

About 55 percent of the electrolytic refining capacity is accounted for by five refineries on the Atlantic Coast in New York City, Carteret and Perth Amboy, N.J., and Baltimore, Md.; five electrolytic refineries in Arizona, Washington, Montana, Utah, and Texas provide the remainder. Three Michigan plants fire-refine Lake copper, and fire-refined copper is also produced in New Mexico, Texas, and New Jersey.

Most of the major copper-fabricating plants (brass and wire mills) are in the Connecticut Valley area. Two California plants were

placed in operation in 1957. Secondary smelters are far less concentrated, and about 3,000 foundries and miscellaneous users of copper materials are scattered throughout the United States.

For many years before World War II, U.S. smelting and refining capacity was excessive for treating domestic materials, and the excess capacity was used to treat substantial quantities of foreign crude materials. Since the war, foreign producers have made great progress in building their own reduction plants. In 1958 there were approximately 95 primary smelters and refineries in 25 foreign countries.

DEFINITION OF TERMS, GRADES, AND SPECIFICATIONS

There are three basic classes of commercial copper that arise from the high affinity of molten copper for oxygen, and the methods employed for its control. They are designated as Tough Pitch Copper, Oxygen-Free Copper, and Deoxidized Copper. Several types of each class of commercial copper are available in refinery shapes, and wrought and cast products. Eighteen such types are recognized by the American Society for Testing Materials in its Classification of Coppers. This classification is shown in table 1 and the terms used are defined as follows:

TABLE 1.—*Classification of coppers*

Designation	Type of copper	Forms in which available							
		From refiners				From fabricators			
		Wire bars	Billets	Cakes	Ingots and ingot bars	Flat products	Pipe and tube	Rod and wire	Shapes
Cath	Electrolytic cathode	Available in cathodes only.							
		Tough pitch coppers							
ETP	Electrolytic tough pitch	X	X	X	X	X	X	X	X
FRHC	Fire-refined high conductivity tough pitch		X	X		X	X		
FRTP	Fire-refined tough pitch		X	X		X	X	X	X
ATP	Arsenical tough pitch								
STP	Silver bearing tough pitch	X			X			X	X
SATP	Silver bearing arsenical tough pitch								
CAST	Casting				X				
		Oxygen-free coppers							
OF	Oxygen-free without residual deoxidants	X	X	X		X	X	X	X
OFP	Oxygen-free, phosphorus bearing		X	X				X	X
OFPTE	Oxygen-free, phosphorus and tellurium bearing								
OFS	Oxygen-free, silver bearing	X	X	X		X		X	X
OFTE	Oxygen-free, tellurium bearing								
		Deoxidized coppers							
DHP	Phosphorized, high residual phosphorus	X	X	X		X	X	X	X
DLP	Phosphorized, low residual phosphorus		X	X		X	X		
DPS	Phosphorized, silver bearing								
DPA	Phosphorized, arsenical								
DPTE	Phosphorized, tellurium bearing							X	X

Electrolytic copper is that refined by electrolytic deposition. *Fire-refined copper* is refined by using a furnace process only. *Tough-pitch copper* is electrolytic or fire-refined copper cast in refinery shapes and containing a controlled quantity of oxygen in cuprous oxide. *Oxygen-free copper* is refined copper cast under a deoxidizing atmosphere that eliminates all cuprous oxide without using metallic or metalloidal deoxidizers. *Deoxidized copper* is refined copper freed from cuprous oxide through use of metallic or metalloidal deoxidizers.

High conductivity copper has a minimum conductivity of 100 percent I.A.C.S. in the annealed condition. *Casting copper* is fire-refined tough-pitch copper, usually derived from secondary metal and cast into ingot and ingot bars only for use in making foundry castings, but no wrought products. *Phosphorized copper* is a general term applied to copper deoxidized with phosphorus. It is the most commonly used deoxidized copper. *Arsenical copper, phosphorus bearing copper, silver bearing copper, tellurium bearing copper.*—Copper containing the designated element in

amounts as agreed upon between the supplier and the consumer. Any of these alloyed coppers can be produced as tough-pitch, oxygen-free, or deoxidised varieties. Table 1 shows the ones commonly supplied.

Several refinery shapes are made depending partly on the end use of the copper.

Wire bar is a refinery shape for rolling into rod (and subsequent drawing into wire), strip or shape. Wire bars are approximately 3½ to 5 inches square in cross-section, usually from 38 to 54 inches in length, and weighing from 135 to 420 pounds. They are tapered at both ends when used for rolling into rod for subsequent wire drawing and may be unpointed when used for rolling into strip. *Cake* is used for rolling into plate, sheet, strip, or shape. It is rectangular in cross-section of various sizes and ranges from 140 to 4,000 pounds or more in weight. The refinery shape used primarily for tube manufacture is termed billet. It is circular in cross-section, usually 3 to 10 inches in diameter and in lengths up to 52 inches; weight from 100 to 1,500 pounds. *Ingot and ingot bars* are employed for alloy production (not fabrication). Ingots usually weigh from 20 to 35 pounds and ingot bars from 50 to 70 pounds. Both usually are notched to facilitate breaking into smaller pieces and are used for remelting. Unmelted flat plate produced by electrolytic refining is called *cathode*. The customary size is about 3 feet square and about ½ to ⅞ inches thick, weighing up to 280 pounds.

Copper is graded principally according to its chemical composition and electrical resistivity. Specifications adopted for selected American Society of Testing Materials (ASTM) designations are as follows:

B4—42 Lake copper wire bars, cakes, slabs, billets, ingots and ingot bars (must originate on the northern peninsula of Michigan).

(a) Low resistance lake copper—minimum purity of 99.900 percent, silver being counted as copper.

	Resistivity, maximum international ohm (meter, gram)
Wire bars	0.15328
Cakes, slabs, and billets:	
When specified for electrical use at time of purchase	.15328
Other uses	.15694
Ingots and ingot bars	.15694

(b) High resistance Lake copper—minimum purity of 99.900 percent, silver and arsenic being counted as copper. Lake copper, having a resistivity at a temperature of 20° C. (68° F.) greater than 0.15694 ohm (meter, gram), shall be known as "high resistance lake."

B5—43 Electrolytic copper wire bars, cakes, slabs, billets, ingots and ingot bars—minimum purity of 99.900 percent, silver being counted as copper.

	Resistivity, maximum international ohm (meter, gram)
Wire bars	0.15328
Cakes, slabs, and billets:	
When specified for electrical use at time of purchase	.15328
Other uses	.15694
Ingots and ingot bars	.15694

B115—43 Electrolytic cathode copper—minimum purity of 99.90 percent, silver being counted as copper. The copper shall have a resistivity not to exceed 0.15328 international ohms per metergram at 20° C. (annealed).

B170—47 Electrolytic copper, oxygen-free, wire bars, billets, and cakes—minimum purity of 99.92 percent, silver being counted as copper. The copper in all shapes shall have a resistivity not to exceed 0.15328 ohms (meter, gram) at 20° C. (annealed).

B72—55T Fire-refined casting copper—must conform to the following requirements as to chemical composition:

	Grade A percent	Grade B percent
Copper plus silver, minimum	99.75	99.50
Arsenic, maximum	.0075	.10
Antimony, maximum	.012	.012
Bismuth, maximum	.008	.008
Iron, maximum	.010	.010
Lead, maximum	.100	.80
Nickel, maximum	.10	.10
Oxygen, maximum	.10	.10
Selenium, maximum	.040	.040
Sulfur, maximum	.01	.01
Tellurium, maximum	.014	.014
Tin, maximum	.025	.05

B216—49 Fire-refined copper for wrought products and alloys—must conform to the following requirements as to chemical composition. (No resistivity specifications.)

	Percent
Copper plus silver, minimum	99.88
Arsenic, maximum	.012
Antimony, maximum	.008
Selenium plus tellurium, maximum	.025
Nickel, maximum	.05
Bismuth, maximum	.008
Lead, maximum	.004

COPPER-BASE ALLOY TERMS

Copper and copper-base alloys comprise a series of metals that include all the alloys which are at least 40 percent copper and where the amount of copper is not less than the amount of any other constituent. There are essentially four well-known kinds of copper-base alloys, e.g. brass, bronze, nickel-silver, and cupro-nickel. Modern nomenclature for certain compositions departs from the original concept that brasses are copper-zinc alloys and bronzes principally copper and tin. Metallurgical research has developed important new alloys and necessitated revision of many original, simple definitions.

Brass may be defined as any copper-base alloy containing zinc as the principal alloying constituent, with or without smaller quantities of other elements. Some of the alloys known as nickel-silver could be termed "brasses," but

these alloys also possess enough distinctive qualities to warrant separate classification. There are alloys that are definitely brasses by definition, yet have names that include the word "bronze;" for example, *commercial bronze* containing 90 percent copper and 10 percent zinc.

The term *bronze* is seldom used alone and the copper-tin alloys have come to be known as *phosphor bronze* because of the small residual phosphorus content. With a suitable modifier the term *bronze* also extends to various copper-base alloy systems where the principal alloying element is other than tin or zinc. These systems include *aluminum bronzes*, *beryllium bronzes*, and *silicon bronzes*.

Nickel-silver, formerly known as German silver, is a copper-alloy containing both nickel and zinc. Its name derives from its predominantly silvery color. *Cupro-nickels* are essentially copper and nickel, the nickel content usually 10, 20, or 30 percent. In addition to these, there are many special and proprietary alloys that include *aluminum-tin bronze*, *aluminum-silicon bronze*, *cadmium bronze*, *chromium copper*, *beryllium copper*, *leaded copper*, and *selenium copper*.

Copper-base alloys are also grouped in two classes according to specifications required in the processes of fabrication. These two classes are wrought alloys and casting or foundry alloys. The *wrought alloys* of copper are regarded as only those made by alloying the various components and casting into slabs, cakes, or billets for hot or cold rolling, drawing, extrusion, or forging. *Casting alloys* are made from a complex assortment of industrial nonferrous scrap by scientific selection, smelting, and refining processes. Many compositions suitable for casting in sand or permanent molds are entirely unfit for working operations.

TECHNOLOGY

GEOLOGY

Deposits of copper are found in a variety of host rocks under greatly varied structural conditions. The periods of their formation range from Precambian to Tertiary, embracing most of known geologic time.

Copper deposits are characteristically associated, both in time and place of formation, with igneous activity. With the Tertiary deposits, and less notable with earlier deposits, both extrusive and intrusive rocks are present. In most copper districts the igneous rocks are of intermediate composition (diorites and monzonites), with the quartzose and porphyritic phases in the intrusive bodies and corresponding compositions in the extrusive rocks.

337366—60——2

Most copper deposits are associated in origin with intrusive bodies, and the deposits tend to group around relatively small stocks or cupolas that are upward projections of batholiths. There is, however, a notable difference in the relation of different types of deposits to the stocks. In the United States the Tertiary copper deposits of the eastern Cordilleran region are in and grouped around the tops of stocks. Much of the copper occurs in the stocks, and most of it is within a few thousand feet of the stocks. The deposits of pre-Cambrian, Paleozoic, and part of those of Mesozoic Age are not so closely associated with exposed stocks. In fact, many of them are several miles from known intrusive bodies, and relatively little copper occurs in stocks. The difference seems to be due to the distance below the surface at which the igneous bodies are intruded and the copper deposits are formed.

Many of the Tertiary stocks were intruded near the surface, as they cut lavas of the same general age which were at most a few thousand feet thick. Solutions moving to the top of and outward from such bodies could not travel far before the change in heat and pressure would cause precipitation of copper minerals in or only a few thousand feet from the stock. Solutions from bodies that were far below the surface could travel farther from the source before loss of heat and decrease of pressure would cause precipitation of copper minerals; therefore, the deposits may be thousands of feet from their igneous source.

Copper occurs in many mineral combinations both in hypogene and supergene deposits. For hypogene deposits associated with igneous rocks, in which copper is the chief metal of economic value, there is not a very wide range in the temperature of deposition, but variations in physical and chemical conditions give corresponding variations in types of deposits. This does not imply that copper does not deposit over a considerable range of temperatures, because copper combined with iron as chalcopyrite or cubanite apparently deposits at a higher temperature than that combined with antimony as tetrahedrite or with sulfur as simple copper sulfide, chalcocite.

Copper deposits are commonly classified as porphyry, cupriferous pyrite, sedimentary, and vein deposits.

Porphyry copper deposits contain most of the world's estimated commercial reserve of copper. Porphyry is an igneous rock in which larger crystals are set in a finer groundmass. In the commercial sense the term *porphyry copper deposits* is not restricted to ore in porphyry but is applied to deposits characterized by huge size, uniform mineral dissemi-

nation, and low average copper content. Many porphyry copper deposits were formed by the secondary enrichment of lean primary sulfides brought about by weathering or other surficial processes and subsequent leaching and deposition of the copper at lower levels from descending surface waters. This action usually develops an upper leached zone containing oxide minerals underlain by an enriched section of higher grade sulfide ores. In most porphyry deposits the primary mineralization is of sufficient grade to constitute an ore of copper. The major porphyry copper deposits of the world are in Southwestern and Western United States, Chile, Peru, and U.S.S.R.; there are smaller deposits in Mexico and Canada.

In the Central African copper belt, the copper ores of Northern Rhodesia occur in *sedimentary deposits* underlain by metamorphic and igneous rocks and overlain by a thick series of younger sediments. The sedimentary beds have been strongly folded into a series of complex anticlines and synclines. The anticlines have been eroded and leave down folded basins of the synclines in the older underlying rocks where concentrations of copper minerals are found. Most of the orebodies consist of sulfide ore, but considerable oxidized ore occurs in certain sections. Belgian Congo deposits are similar to those of Northern Rhodesia except for tighter folding and more abundant faulting. The better known occurrences consist of oxidized ore near the surface but large sulfide deposits exist at depth.

Cupriferous pyrite deposits are usually lenticular or podshaped, contain pyrite and/or pyrrhotite, with chalcopyrite, and are found in crystalline schists or slates lying parallel with the foliation. Pyritic lenses were at one time the world's main source of copper; noted deposits are in Spain, Cyprus, Turkey, Sweden, and in the United States.

Vein deposits are the result of filling open fissures or of replacing wall rock along narrow cracks, thus forming workable ore bodies. The vein system at Butte, Mont., is characteristic of this type of deposit.

MINERALOGY

Copper is found in nature in numerous minerals and in various combinations with other elements. Some 165 copper minerals are known; however, only about 12 are commercially important and about 6 minerals are the source of over 95 percent of the copper mined. Occasionally enough of the minor minerals are found in some ores to be considered a source of copper, but usually they are associated with the major copper minerals.

The principal copper minerals are as follows:

Mineral	Composition	Specific gravity	Copper percent
Native: Native copper	Cu	8.9-8.9	100
Oxides:			
Cuprite	Cu_2O	6.0	88.8
Tenorite	CuO	6.5-6.5	79.9
Malachite	$CuCO_3.Cu(OH)_2$	3.9-4.03	57.3
Azurite	$2CuCO_3.Cu(OH)_2$	3.77	55.1
Chrysocolla	$CuSiO_3.2H_2O$	2.0-2.4	36.0
Antlerite	$CuSO_4.2Cu(OH)_2$	3.9	53.7
Brochantite	$CuSO_4.3Cu(OH)_2$	3.9	56.2
Atacamite	$CuCl_2.3Cu(OH)_2$	3.75-3.77	59.5
Chalcanthite	$CuSO_4.5H_2O$	2.208.2	25.4
Sulfides:			
Chalcocite	Cu_2S	5.5-5.8	79.8
Digenite	Cu_9S_5	5.5-5.6	78.1
Covellite	CuS	4.6-4.6	66.5
Chalcopyrite	$CuFeS_2$	4.1-4.3	34.5
Bornite	Cu_5FeS_4	4.9-5.4	63.3
Enargite	Cu_3AsS_4	4.43-4.45	48.3
Tetrahedrite	$Cu_8Sb_2S_7$	4.7-5.0	45.1
Tennantite	$Cu_8As_2S_7$	4.7-5.0	57.5

There are three important groups of copper-bearing minerals. Primary or hypogene minerals, or those deposited at considerable depth in the earth by processes related to igneous activity. Examples of these are bornite, chalcopyrite, enargite, etc. Oxidized copper minerals are formed by weathering of copper sulfides exposed by erosion. Cuprite, malachite, azurite, and chrysocolla are the chief minerals of the oxidized zones of copper deposits. Brochantite and atacamite are found in the upper portions of orebodies in arid regions. The third group is of secondary or supergene sulfides. These minerals are formed when copper is leached from sulfides exposed near the earth's surface, carried downward in solution, and precipitated near water level. The simple sulfides, chalocite and covellite, are members of this group, although not exclusively so, and other copper-bearing sulfides are occasionally placed in this category.

Native or elemental copper is commonly found in the oxidized zone of most of the principal copper deposits of the world, but usually in small quantities. In contrast to this usual occurrence, the great native copper deposits of the Lake Superior region in Michigan are now believed to be of hypogene origin. The deposits of the Lake Superior district and Corocoro, Bolivia, are the only ones of economic importance in which elemental copper is the chief ore mineral.

The copper minerals found most frequently at the surface are the green and blue copper carbonates and the green silicates. These colors are distinctive; however, a rock with a very small percentage of copper may be colored green. Cuprite, tenorite, native copper, atacamite, chalcanthite, and occasionally other rare copper minerals are found in outcrops; these minerals together with the carbonates and silicate minerals, are usually formed by the weathering of copper sulfides. Chalcopy-

rite and, to a smaller extent, bornite may exist in outcrops or in float, but when found at the surface in arid districts usually are in the form of kernels surrounded by alteration products.

PROSPECTING AND EXPLORATION

Surface prospecting often based on the distinctive coloration due to weathering of copper minerals is the method by which most of the world's present copper mines were discovered. However, the exploration responsible for the expansion of many mines to present day capacities resulted from costly geologic and geophysical investigations, exploratory drilling and underground workings.

Tracing float, trenching and test pitting are the usual surface prospecting methods used. Search for copper minerals that do not outcrop and lie at considerable depth is done by geophysical methods, drilling or shaft sinking. Geophysical prospecting utilizes the gravimetric, magnetic, electric, seismic and thermic properties of rocks and minerals, natural to the ground tested, or produced artificially. Geophysical surveys provided information that encouraged development of two outstanding deposits: (1) Pima mine in Arizona where the ore body lays beneath 200 feet of valley fill and (2) the buried Sherritt Gordon Lynn Lake nickel-copper deposit in Canada. Gravity surveys in an underground copper mine at Bisbee, Arizona partly supplanted exploratory crosscutting and diamond drilling.

Initial exploration to define limits and boundaries and show the importance of newly found deposits is usually accomplished by drilling. Three principal types of drills are employed; churn drills, core drills, and hammer or percussion drills. Diamond drilling is most widely used in exploration because of its speed, adaptability for directional drilling, and core recovery.

MINING

Both open-pit (or open-cut) and underground methods are used in mining various types of copper ore deposits. The choice of method depends on the size, grade, and depth of the ore body and relative mining costs for the required output. Open-pit mining is the most profitable method of exploiting thin flat beds of ore with shallow cover. Large bed-like masses and ore bodies with widely disseminated mineralization (known as porphyry ore) are mined by the open-pit power-shovel method if they lie close enough to the surface so the cost of removing the overburden is not excessive. If the overburden-to-ore ratio is too high, these deposits usually are mined by underground caving systems designed for low-cost mass production. An open-pit copper mine is shown in figure 1.

The general features of open-pit mining appear simple but good management and systematic work are essential. The shape and position of the ore body must be predetermined to allow planning of stripping disposal, approaches, benching design, pit slope, transportation, equipment and other necessities to promote handling a maximum amount of ore and waste. The advantages of the open-pit are: (1) The ease with which mine production can be increased or decreased; (2) the ease with which the mine can be shut down or started up; (3) more selectivity in mining; and (4) complete extraction of the ore. Drilling, blasting, loading, and transportation constitute the cycle of open-pit ore extraction, and improvements of all operations are problems of constant research. Recent advances include the use of rotary drills instead of churn drills for blast-hole drilling; use of the lower cost fertilizer grade ammonia nitrate explosive; the trend toward larger shovel dippers and larger trucks; and the installation at some mines of inclined belt conveyors and skips to remove ore from the pits.

A substantial portion of the world's copper production is mined from deep deposits by underground methods, other than block caving, which are adaptable to maximum extraction of ore from the various types of ore bodies with the greatest safety and at minimum cost. Most of the common underground methods, (square set, rill, shrinkage, top slicing, sublevel caving, cut and fill, long-hole, room and pillar, etc.) with variations are used in mining copper ores. Ore handling systems at large mines are almost completely mechanized and great tonnages of ore are moved at low cost with a minimum of labor. Advancements have been made in lowering transportation and other costs in some mines, making it possible to mine ore bodies or portions of ore bodies not considered economically recoverable a few years ago. Improved drilling equipment, muckers, slushers, haulage equipment, and underground conveyors have increased efficiencies at many copper mines. In some, transportation on haulage levels is controlled by a dispatcher who transmits messages to motormen over a mine telephone or radio system. Inter communication among motor operators is possible, preventing collisions and delays. One way traffic underground is a recent development contributing to reduction of accidents and efficiency in mine haulage.

The growth of open-pit mining since 1939 is shown in figure 2. In the United States

FIGURE 1.—An Open Pit Copper Mine. (Courtesy Kennecott Copper Corp.)

open-pit mining in 1958 accounted for 76 percent of the ore mined and 71 percent of the copper produced. The block-caving operation at San Manuel and the White Pine Copper Co.'s room-and-pillar system account for the slight percentage increase in production from underground mines since 1955.

BENEFICIATION

Processing sulfide ores of copper now provides and, in the foreseeable future, will continue to provide the bulk of the copper produced. The concentrators treating sulfide ores follow similar flowsheets employing crushing, grinding, classifying, flotation, thickening, and filtering (figure 3).

The flotation process for separating copper sulfide minerals from gangue material is far advanced and is used universally except at some small operations, which may employ gravity concentration using jigs or vibrating tables. Large concentrators following good milling practice recover about 90 percent of the copper in the concentrate. The typical copper concentrate, in the United States, contains 25 to 30 percent copper and sometimes gold, silver, molybdenum, and selenium.

Recovery of copper carbonate minerals, either alone or together with copper sulfides by sulfidation and xanthate flotation has been achieved with a certain degree of success, but flotation of the silicate minerals, dioptase and chrysocolla, remains to be solved. Numerous procedures for floating silicates have been reported, but the processes are uneconomic.

LEACHING

Approximately 9 percent of the U.S. production of copper is by hydrometallurgical methods. Leaching followed by cementation or electrolysis is the process used to recover copper from ores containing copper oxide minerals.

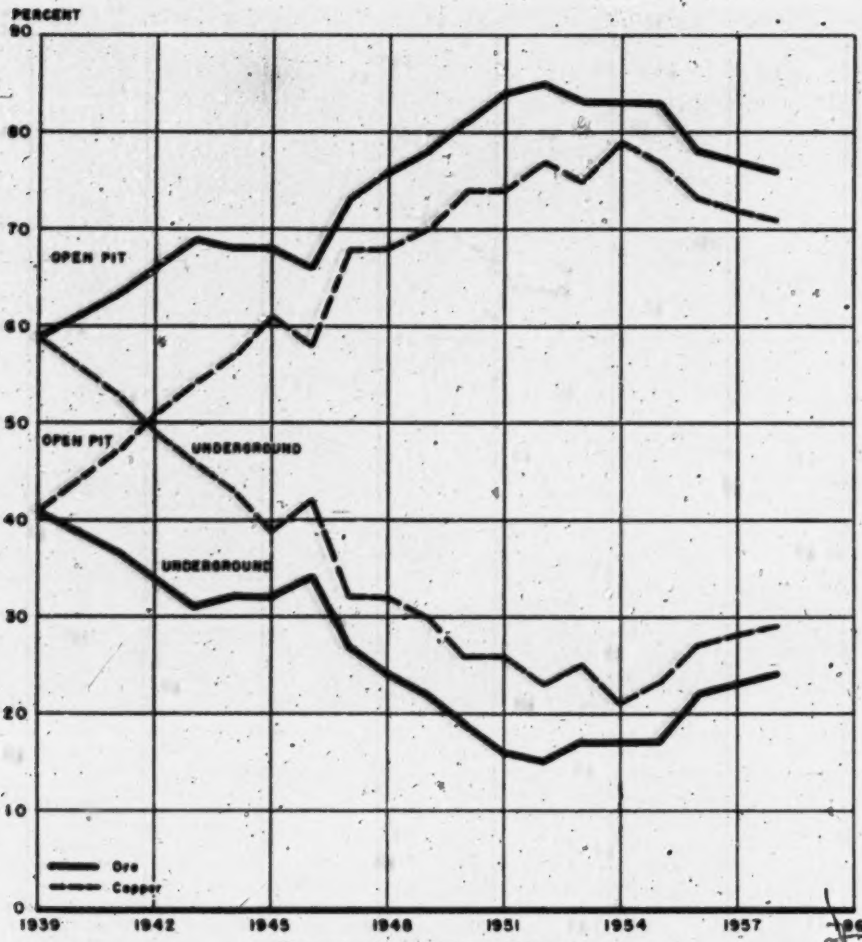

FIGURE 2.—Growth of Open-Pit Mining.

Oxidised copper minerals, such as the carbonates and silicates are readily attacked and the copper dissolved by a number of the more common acids and alkalies; the copper is precipitated from solution by electrolysis or by iron replacement of the copper, and in the case of ammonia leaching by simply boiling off the ammonia. The usual practice is to leach the ore with dilute sulfuric acid followed by recovery of the copper by cementation on scrap iron.

Leaching of mixed oxide-sulfide ores is more difficult. Ferric sulfate is an active solvent of most oxidised copper minerals and to an extent is effective on free copper sulfides. Complete extraction is possible on oxides and carbonates in comparatively short periods while sulfides are more slowly acted upon. To overcome the resistance of double sulfides, such as chalcopyrite and bornite, to this reagent, controlled roasting prior to leaching allows com-

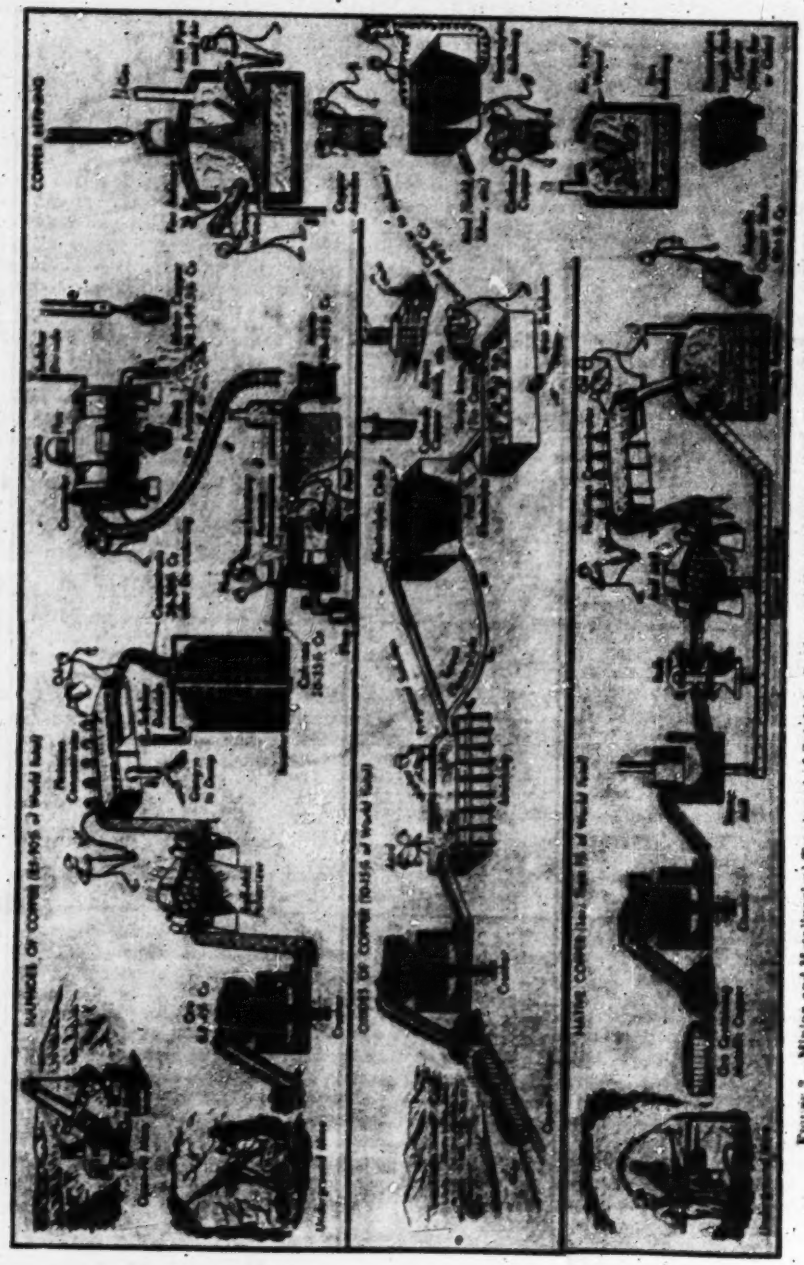

FIGURE 3.—Mining and Metallurgical Treatment of Sulphide, Oxide, and Native Copper Ores. (Courtesy Westinghouse Engineer)

mercial extraction. Acid-ferric sulfate leaching of mixed oxide-sulfide ores followed by electrowinning was for years standard practice by the Inspiration Copper Co. in Arizona, but recently the dual metallurgy process involving leaching followed by flotation concentration was begun. In this process leaching dissolves the recoverable oxide content of the ore, and part of the sulfide content. The washed and drained residue from this operation is then treated by flotation concentration to win the remainder of the recoverable sulfide copper content. Leach-precipitation-flotation of mixed ores has been employed on a commercial scale at one mill in Arizona and by The Anaconda Co. in Montana.

SMELTING AND REFINING

The smelting of sulfide copper ores or concentrates involves three major steps—roasting, reverberatory furnacing, and converting. Roasting removes a portion of the sulfur, as well as some of the volatile components like arsenic, antimony, and bismuth, and oxidizes some of the iron to ferrous oxide. Reverberatory smelting of the roasted material to copper matte is based on the strong affinity of copper and sulfur for each other, as compared with that of other metals and sulfur, and the relatively weaker affinity of copper for oxygen. In a reducing or neutral atmosphere and at smelting temperatures, copper and sulfur form the stable cuprous sulfide, Cu_2S. Excess sulfur, under reducing conditions, unites with iron to form a correspondingly stable ferrous sulfide, FeS. Cuprous sulfide and ferrous sulfide are miscible in all proportions in the liquid state. In the solid state they form an eutectic. The mixture whether liquid or solid, is known as copper matte. Excess iron, usually in the form of ferrous oxide, FeO, combines with silica and enters the slag as ferrous silicate.

The matte formed in the reverberatory furnace is transferred to a refractory lined vessel, known as a converter, where thin streams of air are forced through the molten mass. The rapid oxidation reaction converts the copper sulfide to copper and sulfur dioxide.

The iron sulfide of the matte reacts with the oxygen of the air to form iron oxide that combines with charged silica flux to form the converter slag. This slag contains appreciable copper and is returned and charged to the reverberatory furnace. The molten copper metal is transferred from the converter into a holding furnace from which it is cast as blister copper in anode slabs or cakes.

Furnace or fire refining of blister copper consists of oxidation, fluxing and reduction. The basis of this operation is the weak affinity of copper for oxygen as contrasted to that of the impurities. The practice is to introduce compressed air into the molten metal at 8 to 10 pounds pressure through iron pipes; metallic oxides of the impurities are formed that combine with added silica to form slag. The slag is skimmed continuously during the oxidizing period until no more slag forms and liquid cuprous oxide, Cu_2O, begins to form on the bath. Reduction of the cuprous oxide is accomplished by stirring the bath with green wooden poles. The reducing gases formed (CO, H_2 and hydrocarbons) by destructive distillation of the wood reduce the Cu_2O to metallic copper. The order in which impurities in copper are removed by oxidation in fire-refining methods is: Sulfur, zinc, tin, and iron. Lead, arsenic, and antimony in large quantities can be eliminated by fluxing. Some impurities, such as nickel, bismuth, selenium, and tellurium resist fire-refining treatments almost completely.

Electrolytic refining of copper is based on the selective action of the electric current. A copper anode and a cathode starting sheet are suspended in an electrolyte composed of copper sulfate and sulfuric acid. The copper dissolves from the anode and is deposited on the cathode. Most of the usual impurities such as gold, silver, platinum, and palladium precipitate out of solution and form anode mud which accumulates at the bottom of the electrolytic cell; others dissolve and become concentrated in the electrolyte and may be deposited or occluded on the cathode. Cathode copper has a minimum purity of 99.90 percent.

USES AND PROPERTIES

Copper has numerous valuable properties that, individually or in combination, give it a wide variety of uses. The properties of major significance are high electrical and thermal conductivity, ductility, malleability, formability, strength, and corrosion resistance. In addition, copper has a pleasing color, is nonmagnetic, and is easily finished by plating or lacquering; it can be welded, brazed and soldered satisfactorily. When it is desirable to improve certain of these basic properties and when such an improvement can be effected without sacrificing any required qualities for

a particular application, alloying often solves the problem. As a consequence, the popular commercial brasses, bronzes, copper-nickel alloys and nickel silvers have been developed.

The use of copper and its alloys is universal. They are practically synonymous with all things electrical and have myriad uses in construction, autos, aircraft, missiles, railroad equipment, marine equipment, appliances, machinery and equipment, scientific instruments, utensils and jewelry, cladding, and many other applications.

Approximately one-half of all copper consumed is for electrical applications, including power transmission, communications, electronics, electrical equipment, transportation, and complex weapons systems. Construction (homes, plants, office buildings), power generation and transmission are the largest users. Virtually all building wiring is copper, as are lines leading from power cables. The transmission of power continues to be a major market for copper even though aluminum is now used for most overhead high voltage lines; however, copper still dominates in high voltage underground lines. Power generation requires extremely large quantities of copper. Examples are heat exchangers, windings in motors, generators and transformers, magnet wire in control apparatus, and bus bars.

For communications, telephone and telegraph wire and cable are two of the biggest markets. Hundreds of components in radio sets and telegraph receiving and sending equipment are made of copper or its alloys; and coaxial cables employ a substantial amount of copper. Copper's excellent electrical conductivity has made it the major metal used in the expanding applications of printed circuits. Radio and TV sets provide the largest market but there is a great potential for the use of printed circuits in appliances, automobile instrument panels, and electronic computers.

The noncorrosive quality of copper and its alloys accounts for many uses in construction for roofing products, plumbing goods, builder's hardware, and functional decorative applications. Sheet roofing, gutters, downspouts and heads, flashing, fittings and accessories consume a large amount of copper. Copper and red brass are found frequently in plumbing items such as, tank lever lift arms, toilet tank trim, lavatory fittings, tub fittings, faucets, traps and drains, closet tank components, flush valves, piping and tubing, and other fixtures. Brass and bronze are popular for builder's hardware because they are decorative, noncorrosive, and easy to fabricate for such items as locks, door knobs and knockers, door stops, hinges, bolts, latches, and safety hasps.

Copper consumption in the automotive industry accounts for about 8 percent of the total for the United States. Volume uses are in radiators, heaters and defrosters, air conditioning units, bearings, bushings, carburetors, generators, oil lines, strainers, wiring, switches, and plating. Major uses take sheets, plates and wire; secondary uses, rods, bars, and foundry products. The average 1958 and 1959 autos consumed 40 to 50 pounds of copper.

For aircraft the maze of wiring in a plane's electrical system takes more copper than any other use in this industry. Some of the larger planes use from 600 to almost 2,000 pounds of copper in the electrical systems and mechanical components.

Copper is a minor, though essential, metal in the Nation's missile program. As in aircraft, the major use is in wiring systems.

Railroads use a large quantity of copper in diesel locomotives, passenger cars, and in switching and signal devices. The average Pullman car uses almost 2,000 pounds of copper tube in the water supply system, air brakes, heating system, air conditioning unit, condensers, evaporator and heat coils.

Tankers, cargo ships, pleasure craft, passenger liners, and naval vessels take advantage of copper and its alloys in a great variety of marine equipment. Naval brass is widely used for propeller shafting (because of its strength, torque resistance, machinability, and corrosion resistance); silicon bronze for fastenings and water tanks; soft and hard drawn copper for exhaust yokes, fuel lines, water lines, and piping (resistance to corrosion and leaks, workability, long life). The Navy's nuclear submarine Skipjack uses brass in capstans, torpedo tubes, diving gear, and valves; more than 48,000 feet of copper tube in hydraulic, air, and lubricating oil lines; and over 6,000 feet of cupro-nickel tube in auxiliary cooling lines, heat exchangers, lavatories, bilge pumps, and salt water service lines.

In the appliance field, manufacturers of washing machines, air-conditioning units, refrigerators, TV sets, and other units specify copper and its alloys for many components requiring materials that are electrically or thermally conductive, corrosion resistant and durable.

Large machinery and equipment, turbines, and heat exchangers take advantage of the properties of copper or its alloys in many ways. Specific uses are copper for motors, other electrical equipment and tubing; bronze for worm wheels, oil baffles, check valves, and levers; cupro-nickel for tubing; naval brass, muntz metal, and aluminum bronze for plates, sheets, bars, and weld wire.

TABLE 2.—*Copper use pattern in 1950 (President's Materials Policy Commission Report)*

	Short tons (thousands)	Percent of total
Electrical	368	22.0
Telephone and telegraph	67	4.0
Light and power	120	7.0
Wire cloth	10	.7
Other rod and wire	127	8.0
Ammunition	70	5.0
Automobiles and trucks	145	10.0
Building	265	15.0
Clocks and watches	7	.5
Copper-bearing steel	8	.5
Radiators and heating	9	.6
Radio and television	80	5.0
Railroads	35	2.0
Refrigerators	35	2.0
Shipbuilding	22	1.0
Air conditioning	30	2.0
Others	96	6.0
Manufactured for export [1]	131	10.7
Total	1,620	100.0

[1] Comprises the copper content of all mill products and all fabricated products which were exported, but does not include any raw copper exported as such.

Copper is used extensively in watches, clocks, microscopes, projectors, and many types of gages.

Solid copper, brass, and bronze are popular materials for utensils, jewelry, furnishings, and decorative items. They are used in the manufacture of such items as: Brass and bronze medallions; solid brass furnishings, such as towel bars, curtain rods, wall hooks, and soap dishes; copper, brass, and bronze jewelry; cookware; tableware; and bronze and brass plaques and signs.

BYPRODUCTS, COPRODUCTS, RELATIONSHIPS TO OTHER COMMODITIES

About 98 percent of the U.S. mine production of copper is recovered from copper ore; and the remainder from complex ores. In addition to copper, important quantities of byproduct, gold, silver, sulfuric acid, molybdenum, selenium, arsenic, and platinum-group metals are recovered. These byproducts or coproducts may be recovered at one or more of the various steps of concentration, smelting, and refining. About 40 percent of the 41 million pounds of molybdenum produced in 1958 was recovered as a byproduct largely from copper ores; of the 682,000 pounds of selenium produced in 1958, about 600,000 pounds was recovered from the electrolytic production of copper; and 496,000 tons of sulfuric acid was produced at copper plants (includes output of a lead smelter). In the five year period 1954–58 approximately 30 percent of the United States gold production and 28 percent of the silver production were derived from the processing of copper ores. Nearly one-half of the copper output in Canada comes from ores of the Sudbury district, Ontario, mined principally for nickel, and approximately 50 percent of the world's cobalt production in 1958 came from processing Belgian Congo copper ores.

SUBSTITUTES

Aluminum is the principal alternative material for copper as an electrical conductor. Price is one of several factors that influence its partial substitution for copper. Aluminum wire with a steel core (ACSR) has displaced copper for long-distance transmission lines. Other typical substitutions of aluminum for copper are in bus bars, fractional horsepower motor windings and lightbulb bases. There has been an accelerated shift to the use of steel for brass in shell cases.

Aluminum and stainless steels have also somewhat reduced the use of copper in the building industry. Technology has furthered substitution for copper by the introduction of the numerous clad metals, including copper clad, which use proportionately less metal than would solid copper. Printed electrical circuits have also come into the field as a substitute for copper wire and plastic tubing replaces copper in some automobiles and appliances and other uses.

A study of the use of copper and aluminum in 1954 compared with 1947, for selected product groups, was made by the Business and Defense Services Administration. Some of the major groups selected show the following changes: Power transmission equipment, copper rose 92 percent and aluminum 310 percent; radio and radio products, copper rose 74 percent and aluminum 261; engine electrical equipment, copper rose 39 percent and aluminum 556; metal stampings, copper dropped 27 percent while aluminum rose 25; telephone and telegraph equipment, copper dropped 11 percent while aluminum rose 170, and the grand total for all industrial groups, copper dropped 14 percent as aluminum rose 103 percent.

Adjustment to the new competing materials does not involve much more than a shift in the overall consumption pattern. It will make more copper available for those uses for which it is peculiarly fitted and for which substitutes are impracticable.

SECONDARY SOURCES AND RECOVERY

Secondary copper is that copper recovered from copper scrap, copper-alloy scrap, and other copper-bearing scrap materials as copper metal, as copper alloys without separation of the copper, or as copper compounds. Second-

ary copper is produced from new and old scrap, the two general classes of scrap copper.

New scrap is generated in manufacturing articles from primary or refined metal and consumed at a plant of different location from the plant of generation. Typical types of new scrap are defective finished or semifinished articles, clippings, punchings, turnings, borings, skimmings, drosses, and slag. New scrap consumed in the plant of generation is called *runaround* or *home* scrap.

Old scrap consists of articles that have been discarded after serving a useful purpose. Such articles may be worn out, obsolete, or damaged, and include discarded trolley wire, radiators, fired cartridge cases, used pipe, and lithographers' plates. Old scrap is largely collected by several thousand scrap dealers, who, for the most part, are unaffiliated with the primary copper producers.

The channels through which much of the reclaimed copper returns from the scrap dealers and fabricators to use are the secondary refiners, the brass and bronze ingot makers, and the brass mills.

Total secondary-copper production increased markedly during the past 25 years. From an average yearly recovery of 436,000 tons in 1933–37, output rose to 609,000 tons a year in 1938–42, and to 962,000 tons in 1943–47. In the 1948–52 period it dropped to 900,000 tons, and in the last 5-year period (1954–58) to 880,000 tons. Most of the secondary copper is recovered in ingot brass and bronze and other alloys; recovery of scrap as unalloyed represents less than one-third of the annual total.

Copper and copper-base alloy scrap is sorted and separated into its various classifications. The separation is made on the basis of color, hardness, magnetic properties, type of fabrication, reaction to acids and other reagents, and original source. Brass scrap is sorted piece by piece. Like materials are grouped, assayed, and stored according to composition and metallic content. Furnace charges are made up of weighted amounts of one or more types of scrap that will closely approximate the desired composition of the alloy to be cast. After the charge has been melted a sample of the bath is taken and refining, consisting of fluxing, oxidation and slagging is started. After refining calculated additions of virgin metals are made to adjust the analysis of the melt to specifications and the heat is tapped and poured into ingots.

A substantial quantity of clean copper scrap is remelted, cast into anodes and electrolytically refined. Other copper scrap is charged to reverberatories at primary smelters and is recovered as electrolytic or fire refined copper.

TABLE 3.—*Secondary copper produced in the United States*

[Short tons]

	1948–52 (average)	1954	1955	1956	1957	1958
Copper recovered as unalloyed copper	322,860	313,241	345,028	373,060	349,018	295,123
Copper recovered in alloys[1]	574,022	607,066	742,976	627,004	493,973	542,307
Total secondary scrap	895,995	920,307	988,004	935,064	841,997	797,388
From new scrap	442,884	425,941	474,419	482,173	397,206	386,021
From old scrap	454,181	497,066	514,584	452,490	444,892	411,367
Percentage equivalent of domestic mine output	101	101	99	94	77	81

[1] Includes copper in chemicals, as follows: 1948–52 (average), 16,419; 1954, 15,052; 1955, 14,552; 1956, 14,750; 1957, 14,345; 1958, 9,491.

RESERVES

Copper occurs widely but the five principal producing areas contain 93 percent of the world measured and indicated reserve. These are: (1) Chile and Peru, (2) Western United States, (3) Northern Rhodesia and Belgian Congo, (4) U.S.S.R. and (5) Canada. The measured and indicated world reserve is estimated, in terms of metal content, at 170 million tons of copper. The estimates are based on the assumption that the cost-price ratio will be such as to permit the mining of ore having approximately the same grade as that which is now being produced.

Chile has the largest reserve with 46 million tons, followed in order by the United States (32.5 million), Northern Rhodesia (24.5 million), Belgian Congo (20 million), Soviet Bloc (16 million), Peru (12.5 million), and Canada (7 million). Substantial orebodies make up the smaller reserves of Yugoslavia (1.2 million), Union of South Africa and South-West Africa (1.1 million), Australia (1 million), Philippines (1 million); Mexico (750,000), Turkey (500,000), and Cyprus (200,000). Cuba, Bolivia, Finland, Norway, Spain, Sweden, India, Japan, and other countries account for an estimated additional 6 million tons of recoverable copper. There are substantial inferred reserves that will likely develop into measured or indicated ore upon extension of present mine workings and delin-

cation of new deposits by planned expansion and exploration projects.

The United States has a reserve of recoverable copper-in-use estimated to be about 30 million tons.

CONSERVATION

Mining and metallurgical research leading to more economic extraction and beneficiation of copper ores have made immense tonnages of ore available which otherwise would have been of no value as a source of copper. The need for lower costs, in turn, has encouraged research for the development of more efficient methods and techniques at all levels in the production of copper and copper products.

One of the most effective conservation practices is the reclamation of copper from scrap that provides approximately one-fourth of the U.S. supply.

SOURCES OF STATISTICAL INFORMATION

Monthly and annual data on mine production of recoverable copper are reported by producers to the Federal Bureau of Mines; monthly data on production of blister copper, refined copper by shapes, stocks of blister, refined and unrefined copper are reported by the primary smelting and refining companies. Primary copper plants and chemical plants report stocks, production, consumption, and shipments of copper sulfate monthly, and copper smelters report production of byproduct sulfuric acid annually. Sales of copper by copper selling agencies are reported annually.

Consumption of refined copper by major industry classes is reported monthly. Consumption of scrap by types, by primary copper producers, secondary smelters and brass mills is reported monthly. Other consumption data collected annually include consumption of brass and bronze ingot by foundries, and refined copper and scrap at foundries, miscellaneous manufacturers and chemical plants. The domestic data collected are sufficiently adequate and accurate for current programming and planning.

World mine and smelter production data are compiled by the Bureau's Division of Foreign Activities. U.S. imports and exports of copper are obtained by the Bureau of the Census.

There are no data on consumption of copper by end uses or by geographic locations. Also lacking are adequate consumption data outside the United States.

PRODUCTION, CONSUMPTION, AND FOREIGN TRADE

PRODUCTION

World mine production of copper has increased without interruption since 1950, and output of 3.9 million tons in 1957 established a world-production record. The increased rates were due mainly to output from new properties and stepped-up production at many established mines encouraged by the highest prices in 90 years.

The United States is the largest copper-producing country in the world and has been for many years (figure 4 on p. 18). The United States lost this position only once since 1883, when Chile outranked it in the depression year 1934. In the most recent 10-year period (1949–58) the United States produced 29 percent of the world output. Chile usually ranks second among leading copper-producing countries, however, in 1953 and 1954 it was surpassed by Northern Rhodesia. Six countries each averaged in excess of 250,000 tons annually in the last 5 years as follows, in thousands of tons: United States 1,001; Chile 493; Northern Rhodesia 440; U.S.S.R. 421; Canada 338; and Belgian Congo 261. Comparable data in the previous 5-year period, 1949–53, were: United States 888; Chile 416; Northern Rhodesia 347; U.S.S.R. 280; Canada 269; and Belgian Congo 205.

TABLE 4.—*Supply and distribution of copper in the United States*

[Thousand short tons]

Year	Supply					Distribution			
	Production			Imports (refined)	Total	Consumption		Exports (refined)	Total
	Primary		Secondary (old scrap)			Refined	Secondary (in alloys)		
	Domestic materials	Foreign materials							
1949–53 (average)	886	220	634	224	1,964	1,488	330	146	1,964

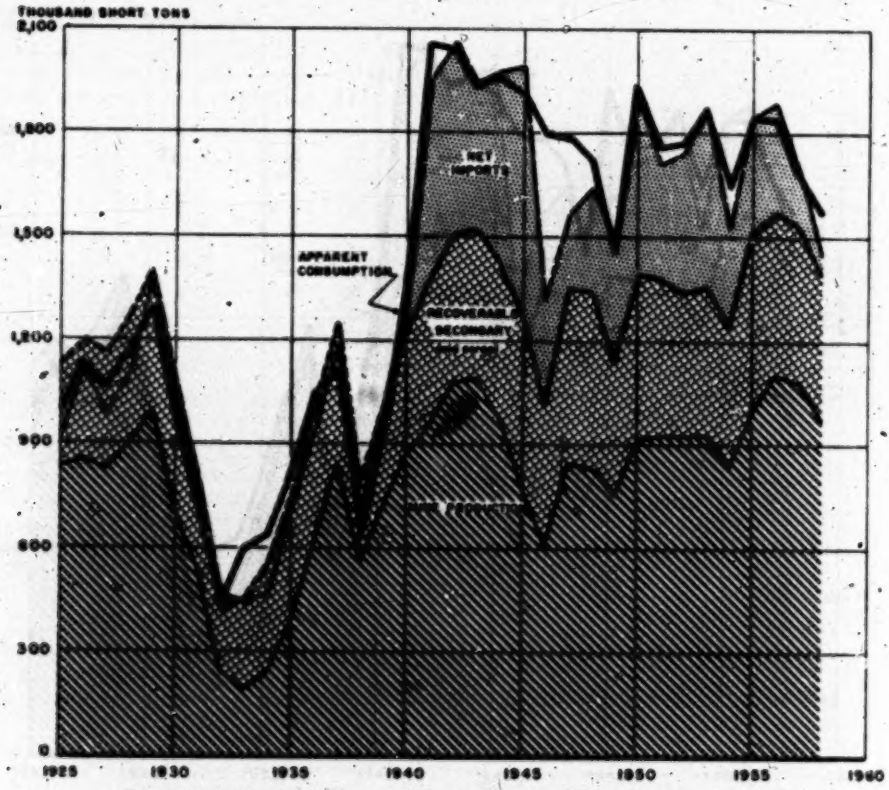

FIGURE 4.—Salient Statistics of the Copper Industry of the United States, 1925–58.

The shortage of copper supply that existed for most of the period from the beginning of World War II was reversed in 1956. More than enough copper became available and to reduce the oversupply many producers curtailed production beginning in October 1956. Reductions continued throughout 1957 and into 1958. Demand for copper turned upward about mid-1958, and in the late months of the year production schedules in the United States and abroad were stepped up to meet the increasing demand.

CONSUMPTION

Over the period 1948 to 1958 the annual consumption of copper in the world increased (according to data compiled by the American Bureau of Metal Statistics) from 2,764,000 tons in 1948 to 4,091,000 tons in 1958. This increase of about 50 percent was due to the demand for copper necessary for rehabilitation and rebuilding of industries in the war stricken countries of Europe, growth of industry in underdeveloped countries, and expansion of industrial activity in others. Except for 1949 and 1953 world consumption made significant advances each year. Although the United States maintained its status as the largest copper consuming country as it had since the turn of the century, its percentage of world demand dropped approximately 40 percent. Consumption in the United States during the last decade advanced 9 percent to the alltime peace time high in 1956, then declined 20 percent due to the recession in 1957 and 1958.

The consumption of refined copper, by broad industry classifications, is shown in table 8. There are no recent continuing statistical data

showing the consumption of copper by end uses. However, quantities of copper used in 1950 for certain products and industries estimated by an industry representative for the President's Materials Policy Commission are shown in table 2.

FOREIGN TRADE

Before World War II U.S. imports and exports of copper constituted a well-balanced trade through which the smelting, refining, and fabricating facilities of this country were used to treat foreign crude materials and to return refined copper and manufactures of copper abroad. After the beginning of the war the United States needed all the copper that entered the country to supply new peak consumption needs. In the postwar period demand continued above prewar levels to fill postponed civilian requirements; as a result the United States had remained partially dependent on imported material.

The alltime record receipts of foreign materials was made in 1945 when 853,000 tons of copper in all forms was received; a record quantity of refined copper (530,000) tons also was received in 1945. From 1954 through 1958, 41 percent of the refined and unrefined copper imported came from Chile, 18 percent from Canada, 9 percent from Mexico, 8 percent from the Federation of Rhodesia and Nyasaland, and 6 percent from Peru; 47 percent was in the form of blister and other unrefined materials, 31 percent in refined form, and 20 percent was ores and concentrates.

Most of the copper exported from the United States is refined copper and in advanced forms

[1] Data are "general" imports; that is, they include copper imported for immediate consumption plus material entering the country under bond.

of manufacture, in which the copper content is not calculable. Because supplies of copper in the United States have been inadequate to fill requirements in most of the period since the end of World War II, copper has been subject to export controls. During 1949–53 exports of refined copper averaged 140,000 tons annually, and ranged from 110,000 to 174,000 tons. In the 5-year period, 1954–58, inclusive, exports of refined copper rose to an average of 274,000 tons annually and ranged from 200,000 tons to 385,000. All restrictions on exports of refined copper were removed in September 1956 and shipments of such metal from the United States during 1958 rose to 385,000 tons, the highest since 1929.

TABLE 10.—*Exports of refined copper from the United States, by countries (Bureau of the Census)*

SELF SUFFICIENCY AND STRATEGIC CONSIDERATIONS

For many years before World War II U.S. production of primary and secondary copper exceeded demand and there was a substantial surplus for export. Since then, however, roughly one-fourth of domestic needs have come from foreign sources. For the period 1954–58, domestic mine production provided 50 percent of the supply, and imports and old scrap furnished 28 and 22 percent, respectively. Projecting future demand in relation to population increase and per capita consumption and mine production capacities, the United States will continue to be dependent on foreign sources for a sizeable portion of its domestic requirements.

In the 1954–58 period, Western Hemisphere countries furnished 79 percent of U.S. imports; 41 percent came from Chile, 18 percent from Canada, 9 percent from Mexico, 6 percent from Peru, and 5 percent from other countries. Western Hemisphere production of copper is more than adequate to take care of Western Hemisphere consumption and there was an excess of more than 500,000 tons in 1958.

Mining, smelting, and refining capacities to produce copper in the United States plus the imports expected to be available in wartime from strategically accessible foreign sources and the Nation's stockpile, will provide an adequate supply of copper under anticipated emergency conditions. The development of new ore deposits and planned expansions at operating mines in Canada and South America will ensure reliable foreign sources of copper.

The largest strategic use of copper has been in cartridge brass for ammunition; other ordnance items are rotating bands, bullet jackets, bearings, springs, detonators, fuse parts, and primer cups. The uses of copper and its alloys in mobile mounts, jeeps, trucks, tanks, etc., are in general the same as those for automotive applications. Likewise, the uses in field telephones, walkie-talkies, radios, radar, missiles, power generators, and distribution systems are similar to those of electrical applications in related nonstrategic items.

TABLE 11.—*United States mine production of copper, apparent consumption of new copper and excess consumption over production*

[1] Production excess.

DEFENSE PROGRAM

Under the Defense Production Act of 1950, as amended, various types of production expansion assistance were developed for copper—production loans, government floor-price purchase contracts with escalation provisions, certificates of necessity permitting accelerated amortization of capital investment for income tax purposes, and exploration loans amounting to 50 percent of total costs repayable from eventual production. The San Manuel Copper Corp. and the White Pine Copper Co. started delivering their production to the Government under the Defense Materials Procurement Agency (DMPA) floor price contracts in the last quarter of 1957 after the price of copper had fallen to 27 cents in September. Through June 30, 1958, the Defense Minerals Exploration Administration (DMEA) had entered into 53 exploration contracts, in which copper was the major target commodity. The total estimated cost was $3,485,182 of which the Government's share was $1,742,590. Copper reserves have been developed in several areas as a result of the DMEA program.

Other defense measures were establishment of ceiling prices of copper and copper alloys

and strict export controls. Early in 1953 the situation had eased to the point where price controls and national and international allocations of copper were abandoned although military and Atomic Energy Commission needs were still to receive preferential treatment. Due to the continuing shortage of copper until the middle of 1956, quantity export controls were maintained on copper through the third quarter of 1956 and on copper scrap through the third quarter of 1957.

PRICES AND COSTS

Average annual copper prices in the United States have ranged from 5.67 cents a pound in 1932, the lowest in history, to the recent peak of 41.88 cents in 1956. Under price control during World War II and for a short period thereafter when the Government granted premiums on a quota system for copper production, February 1942–June 1947, the average price including all premiums was 14.3 cents a pound. Government regulation of prices following the outbreak of war in Korea established a ceiling of 24.5 cents a pound on January 26, 1951 which lasted until copper prices were decontrolled February 25, 1953. Labor strikes in the latter half of 1954 and increasing consumption of copper both in the United States and Europe resulted in a shortage of copper, and the price rose continually reaching 46 cents a pound on February 21, 1956, the highest in 90 years. Supply surpassed demand in the United States early in 1956 and the first reduction in price in more than 2 years was made in July of that year. A continuing high rate of production and declining consumption resulted in increasing stocks and the price of copper declined gradually until it reached a low of 25 cents a pound in January 1958. The price was raised to 26½ cents in July and to 29 cents in October reflecting effective overall reduction of mine production, a diminishing surplus, and an increasing market.

TABLE 12.—*Average prices of electrolytic copper*

(Cents per pound)

Year	Domestic f.o.b. refinery [1]	Domestic f.o.b. refinery [2]	Domestic copper delivered
1949	19.36	19.202	[3] 19.7
1950	21.46	21.235	[3] 20.8
1951	24.37	24.200	[4] 24.3
1952	24.37	24.200	[4] 24.2

1956	41.88	41.818	42.1
1957	30.99	30.576	30.1
1958	26.13	25.764	26.3

[1] Quoted prices for domestic shipments, American Metal Market.
[2] Quoted prices for domestic shipments, E&MJ Metal and Mineral Markets.
[3] Prices for 1949–50 were f.o.b. refinery and included foreign copper delivered in United States.
[4] Prices for 1951–53 f.o.b. refinery and delivered.

Information on operational or overall costs per unit of production or of final product for mining, milling, smelting, refining, marketing, etc. is not readily available. A study by the Rhodesian Selection Trust Co., Ltd., indicated the cost of producing electrolytic copper in 1955 in the Northern Rhodesian Copperbelt was over 19 cents a pound compared with an average of about 15.25 cents a pound within the United States. An analysis of 1956 production in the United States by The Anaconda Company showed that 13.9 percent cost 30 cents a pound or more, 22.6 percent 29 cents or more and 33.1 percent 25 cents or more, leaving a balance of 66.9 percent produced under 25 cents a pound, but implying the overall average cost a pound of copper in the United States exceeded that of foreign production. Another recent statistical study arrived at a 5 year (1954–58) cost of approximately 25 cents a pound for seven domestic and foreign producing companies that accounted for 30 percent of the world's mine production.

TAXES

There are no special taxes imposed on the copper industry. Producers are granted a depletion allowance of 15 percent on domestic and foreign production.

TARIFF

An excise tax of 4 cents a pound was imposed on copper June 21, 1932. The Government was virtually the only importer in World War II, and during the period it held this position the tax was not applicable. The tax was reinstated for a very brief period, following which it was suspended by acts of Congress from April 30, 1947 to June 30, 1950. The suspended tax, meanwhile, was reduced as a result of the Trade Agreement negotiations at Geneva in 1947, to 2 cents a pound effective March 16, 1949. The 2-cent tax came into effect on July 1, 1950, but was suspended again on April 1, 1951. The law provided that the Tariff Commission must notify the President within 15 days after the end of any calendar month in which the average price dropped below 24 cents a pound, delivered Connecticut Valley, and within 20 days thereafter the President would revoke the suspension. The suspension was extended each year until 1955 when it was extended to June 30, 1958. Meanwhile, at the June 1956 meetings in Geneva on General Agreements Tariffs and Trade

(GATT), copper was subjected to certain concessions. The excise tax on copper metal, ores, nd concentrates would drop 15 percent (5 percent for each of 3 years) if the tariff were reimposed and the price of copper was not below 24 cents a pound. For fiscal 1957, 1958, and 1959, the excise tax would be 1.9, 1.8, and 1.7 cents, respectively. The latter tax became effective July 1, 1958.

RESEARCH

Prospecting and exploration by industry in recent years has resulted in the development of tremendous reserves in the major copper-producing countries. In all principal copper-producing areas in the world, ore reserves today substantially exceed those in the past. Exploratory drilling programs, in some cases supplementing geophysical and geochemical surveys, have confirmed inferred extensions of known deposits and anomalous indications of newly found occurrences. In the United States, prospecting by American Metal Climax, Inc. and Kennecott Copper Corp. found commercial deposits in Michigan; Pima Mining Co., Duval Sulfur and Potash Co., and American Smelting and Refining Co. discovered additional properties in Arizona; and The Anaconda Company outlined enough additional ore at Butte, Montana, for four extensive projects. In Chile, at Chile Exploration Co.'s Chuquicamata mine, additional oxide ore was found by drilling beyond the rim of the pit; the ore reserve at Andes Copper Co.'s El Salvador mine was increased from 80 million tons to 375 million by additional drilling and an important new discovery was made near Cabildo in Aconcagua Province. Through development research Mufulira Copper Mines, Ltd., Northern Rhodesia, have sufficient information to increase the company's copper production by 55 percent. This type of research by the mining companies is responsible for today's developed copper resources which through continuing efforts are expected to increase year by year for some time to come.

Mining equipment companies in developing more efficient earth-moving and transportation units have done much in improving efficiencies and controlling mining costs. Belt conveyors for moving ore to a central point in underground mines, as well as open pits and skip hoists instead of train or truck haulage to remove ore from open-pit mines, are recent improvements made at some properties based on equipment research.

Most segments of the industry have research facilities and men charged with experimentally investigating methods, technologies and equipment respecting their particular fields of mining, mineral dressing, leaching, smelting, refining, fabricating, foundry practice, plating and finishing and related operations. Research in procedure, and equipment for crushing, grinding, classification and flotation of copper ores has resulted in refinements that have improved recovery. In smelting, a study on the thermodynamics of the copper-iron-sulfur system at matte smelting temperatures established more accurately the region of immiscibility between matte and metal in the liquid state. Losses of metal in slag were minimized by deviating from the common practice of returning converter slag to the reverberatory furnace. A process possibility is the direct production of electrolytically refined copper and elemental sulfur from pyritic ores. The fabricating industry is widening its market research activities and improving facilities. An emphasized market research program is being carried into traditional fields such as the automotive industry as well as into such comparatively new areas as electronic computers.

PLAINTIFF'S EXHIBIT 422

Telephone Jersey Shore 477
Central Cable Corporation

Bare and Weatherproof Wire and Cable
Copper and Aluminum

Jersey Shore, Pa.

January 26, 1955.

Mr. Alfred R. Gneiser
Aluminum Co. of America
York, Pennsylvania

Dear Mr. Gneiser:

On January 14 your office advised us of an increase in the aluminum primary metal prices, which reflected an increase on the hot rolled rods we regularly purchase from you, in an amount of one cent per pound. This price, we were advised, was effective on all orders placed after that date, and subject to change without notice.

Coincidental with the increase of the price of the rods we purchase from you, you published price sheets governing the sale of aluminum electrical conductors, which price, we were told, reflected the increased metal cost.

You will recall our several conversations in which you confirmed the reports we had received that aluminum conductor was being sold by producers at prices drastically under the published prices and, further confirmed that these prices were being offered for a stated period, specifically on a firm basis for the first half of 1955.

I am sure your principals will readily recognize the position we find ourselves placed in as a result of the activities outlined above, and our desire for a remedy allowing us to continue the production and sale of aluminum conductor. For this reason we have requested your best price on a firm basis for our requirements of aluminum rod for redrawing for the period to July 1, 1955.

We wish to assure you of our appreciation for your very good service and consideration during the long period we have been purchasing this commodity from you.

May we have your prompt reply.

Very truly yours, Central Cable Corporation, Melvin C. Harris, Vice President.

Copy for Mr. A. R. Gneiser, York
Noted March 4, 1955 A R G

February 14, 1955.

Received February 1, 1955 York Office

Mr. Melvin C. Harris, Vice President,
Central Cable Corporation,
Jersey Shore, Pennsylvania.

Dear Mr. Harris:

In Mr. Gneiser's absence, I am taking the liberty of replying to your letter of January 26, 1955 to him in which you request our best price on a firm basis for your requirements of aluminum redraw rod for the period of July 1, 1955. This reply has been delayed because I referred the matter to our home office in Pittsburgh to determine whether we could quote a firm price for this period and, if so, what that price should be.

I regret to inform you that we cannot quote on a firm basis. All of our sales of aluminum redraw rod are on the basis of price in effect at the time of shipment and we cannot, consistently with the law, quote you a firm price without quoting the same firm price to our other customers who

are competitors of yours. We will be very happy to receive your orders for redraw rod on the basis of our price in effect at time of shipment, and we hope that we will be able to accept all of the business which you care to place with us. We certainly would not condition any acceptance of orders [fol. 5886] upon receiving orders for your full requirements. Any such orders for ⅜ in. dia. EC-H12 or EC-H14 redraw rod, in quantities of 30,000 lbs. or more, will be priced at $.280 per lb., and as stated above, will be invoiced at our price in effect on date of shipment.

In your letter of January 26 you mentioned prices at which aluminum conductor had been sold. While I am informed by our legal counsel that a discussion of prices in past transactions is of itself permissible, the consequences of a misinterpretation of any discussion of this nature are so potentially dangerous both to us and to those with whom such discussions might be had that our company does not permit such discussions with our competitors. Therefore, I have been instructed, in accordance with company policy, not to enter into discussions of conductor prices with you.

I trust that with this explanation you will not think that this letter is at all discourteous or abrupt. Most assuredly we have been happy to serve you in the past and we hope that you will continue to favor us with your business in the future.

Very truly yours, Aluminum Company of America,
——, ——, Assistant District Sales Manager.

Nehring Electrical Works

Manufacturers of
Bare and Weatherproof Copper Wire and Cable
Aluminum Cable, Steel Reinforced (A.C.S.R.)
DeKalb, Illinois

July 1, 1957.

Mr. C. B. Owen
c/o Aluminum Company of America
520 N. Michigan Avenue
Chicago 11, Illinois

Dear Mr. Owen:

We have received the opening of the eleven bids of Tennessee Valley Authority, and have very carefully checked the prices quoted.

We received none of the orders. There were eight bidders on each inquiry and for us to be competitive with the prices quoted, we would have to purchase aluminum rods as low as 28¢ per pound. We very carefully figured our costs and material, except the aluminum, and then included a little profit. We then added the value of the aluminum to bring the total figure up to the prices quoted. In that way we arrived at what we should pay for aluminum rods—as low as 28¢ per pound and not over 30½¢ per pound.

If this condition continues we see no alternative except to produce our own aluminum rods, and we are in very good position to do so.

We are not complaining about anything; we are not even much concerned about the situation, but in all our time, the price of finished copper wire and cable never was reduced unless the price of copper went down. Now the price of aluminum cable is down as much as 5½¢ per pound below the published price sheet, on which the selling price was formerly determined, and yet the price of aluminum is no lower and we are even told the price of aluminum will advance. Another thing, aluminum cable is sold on "firm

price" and aluminum rods sold "subject to price change before shipment".

Thought we would make mention of this condition and would appreciate receiving your comments.

Yours very truly, Nehring Electrical Works, Paul A. Nehring, President.

Re: Nehring Electrical Works

Attached to your letter of July 2 was Mr. Nehring's letter to you of July 1.

I would suggest that you might wish to reply to Mr. Nehring's letter somewhat along the following lines:

"Since receiving your letter of July 1, 1957 I have given a good deal of consideration to the situation which you presented. I cannot say that there is any easy solution to the problem, but I am glad to have the opportunity to comment on it.

"You recognize, I am sure, that in view of the fact our companies compete in the sale of ACSR I cannot discuss with you the pricing policies which might or ought to prevail in that industry. I can mention the historical fact, however, that Alcoa did not take the lead in what has resulted currently in substantial sales of ACSR at prices below published schedules. We have not reduced our schedule prices, but we have found it necessary to quote lower prices from time to time to meet the lower prices being quoted by our competitors.

"You raise the question of what should be done with respect to the price of redraw rod. About all I can say is that competition determines the price, whether of ACSR, redraw rod or pig. So far as our prices are concerned, we would hope to make a fair and reasonable profit on each of our products consistent with a constant endeavor to foster the [fol. 5890] further use of aluminum in all proper applications. Whether we should look solely to the selling price of ACSR in considering prices for our E.C. pig and redraw rod, or whether we should also consider the operations of our company as a whole, is perhaps a matter upon which in-

formed people might theoretically differ. We think we are following a proper procedure, taking into consideration all relevant circumstances. We may be wrong, but at least we are sincere in our belief that we are right."

DeKalb, Illinois

July 16, 1957.

Mr. C. B. Owen
Aluminum Company of America
520 N. Michigan Avenue
Chicago 11, Illinois

Dear Mr. Owen:

Thank you for your letter of July 15th in reply to ours of July 1st wherein mention was made about the sale of ACSR up to 5½¢ below the published sheet on which we used to base our selling prices.

As mentioned previously, the price of rods has not been reduced, yet the price of aluminum rods went up when the

price of copper advanced, but has not come down with the price of copper which has lowered from 16¢ to 26¢ per pound in different parts of the world.

. . . . . .

We have had customers tell us that they are told there is so much profit from the pig to the rod that they can cut the price of cable, but who is going to keep the price of cable down if and when there should be greater demand for cable? It looks as though that's going to be up to the independent manufacturers with aluminum from Canada.

As I stated before, I never saw such a condition in all my time in the manufacture of electrical conductor. We are not trying to bring about any change or asking for any help for we are organized to shut down if need be rather than keep operating; however, I predict if this condition does not change, there will be a complaint to the Department of Justice and I have heard there is such a move underway at present.

We mailed you an order for rods yesterday but rightfully and truthfully under these present conditions, I believe we should get all our rods from Canada or from an independent manufacturer.

With kindest regards and best wishes, we remain,

Yours very truly, Nehring Electrical Works, Paul A. Nehring, President.

PLAINTIFF'S EXHIBIT 430

Nehring Electrical Works

Manufacturers of
Bare and Weatherproof Copper Wire and Cable
Aluminum Cable, Steel Reinforced (A.C.S.R.)
DeKalb, Illinois

January 28, 1958.

Mr. J. B. Holloman
Aluminum Company of America
520 N. Michigan Avenue
Chicago, Illinois

Dear Mr. Holloman:

According to the going price of aluminum cable and for us to meet the highest price (and our cost of production should be as low as any), we should have a rod price from 4¢ to 6¢ a pound lower than the present price of aluminum rods. Therefore, you can readily see why you are not receiving rod business from us at this time.

We are operating at full capacity but entirely on copper at the present time. Just thought we would make mention of this as that is the situation with the independent manufacturer. I presume you know about the one independent manufacturer that is lining up production of aluminum with rolling mill and cabling especially for R.E.A.'s with a $50,000,000 loan from the government. We have been asked to consider an investment in this production.

There was a time many years ago when the independent manufacturers were able to put up a community rolling mill and buy their metal from other than the domestic producers, which we have been doing for two years or more. Prices are certainly all over the map. The quotations we receive on copper vary 2½¢ a pound from the highest to the lowest. There used to be about ⅛¢ to ¼¢ difference in price, that is in the 40 years the writer has experienced.

Yours very truly, Nehring Electrical Works, Paul A. Nehring, President.

February 13, 1958.

Mr. J. B. Holloman
Aluminum Company of America
520 N. Michigan Avenue
Chicago, Illinois

Dear Mr. Holloman:

The New York Brokers are approaching us regarding the possibility of importing aluminum rods. Perhaps we could import pig aluminum at a lower duty and have it converted into rods. Would you be interested on such toll work?

For a long time, we have been buying imported copper as much as 2½¢ per pound below the producer's fixed price, and we have to do something about aluminum. It appears that the market is rigged against us, and we are talking plain about it.

We can have pig aluminum converted by the Properzi Process, but rather than put in such a mill ourselves, we would rather install a mill that would roll copper also.

Yours very truly, Nehring Electrical Works, Paul A. Nehring, President.

February 27, 1958.

Aluminum Company of America
520 N. Michigan Ave.
Chicago 11, Illinois

Att'n. Mr. J. B. Holloman

Gentlemen:

Reference is made to your letter of the 20th which was received the day after you were here in DeKalb.

You mentioned rod business and I believe I explained to you why we have not been purchasing any rods for sometime. This is due to the spread between rods and finished aluminum cable, and the spread of about 8½¢ a pound between the ingot and rods. It is not possible for us to meet the present selling prices. What little we are running now in one machine is for stock and to use up some of the steel core wire we have here. We will see what happens later.

It is lucky for us that we are quite busy on copper at both plants. One of our good customers that is buying a half million pounds of copper from us, says he was told by one of the cable producers that they thought they would cut their price and offer contracts again before long. I wonder if he didn't refer to another "white sale".

We note what you say about your pricing policies. It looks as though about the same thing is going on in copper. The domestic producers' copper is 2½¢ a pound higher than the price from several other sources and from abroad. That is why we think we may have to use aluminum from abroad as well as copper. Doesn't it seem strange that you hear so much noise about the tremendous and wonderful production of aluminum and copper in this country, yet foreign copper

competition outstrips all of you. By the way, we must be quite a big company to be importing material with the 100 million pounds of surplus in the States. What do you think?

Yours very truly, Nehring Electrical Works, Paul A. Nehring, President.

Mr. J. B. Holloman
Aluminum Company of America
520 N. Michigan Avenue
Chicago 11, Illinois

Dear Mr. Holloman:

We received yours of the 9th and also the 15th revising your quotation as an error had been made in the time limit.

As yet, we can buy to better advantage and have to do so because of the small spread between the price of rods and finished cable. Of course, the spread between the ingot and rods is not very large either. There is nothing we would rather do than buy locally, and we just cannot imagine a small company like ours (which we have always tried to keep small), importing material.

Yours very truly, Nehring Electrical Works, Paul A. Nehring, President.

[fol. 5900]

1/ Shipments of aluminum conductor wire and cable are the sum of the shipments of aluminum wire, insulated or covered, and ACSR and aluminum cable, bare.

2/ The Business and Defense Services Administration requires reports only for months in which total shipments of aluminum products by a firm amounted to 10 thousand or more pounds. Thus the maximum amount that a firm could ship in a year and not be required to report would be under 120 thousand pounds per year of all aluminum products. Only if a firm produced only aluminum wire and cable, insulated or covered, and ACSR and aluminum cable, bare, and its shipments were spread evenly over the twelve months could it produce 120 thousand non-reportable pounds in any calendar year. In 1955, the year with the lowest industry total, 120 thousand pounds would be less than seven-hundredths of one per cent of the industry total. Individual company reports to the Department of Justice, however, show that six firms shipped more than 120 thousand pounds in one or more of these years, but did not report their shipments to BDSA. Circle Wire and Cable Corporation unreported shipments in excess of 120 thousand pounds ranged from less than one-tenth of one per cent in 1957 to less than three-tenths of one per cent of the BDSA industry total in 1959. Collyer Insulated Wire Company reported to the Department of Justice its use of aluminum wire and cable in its production of insulated products, rather than its actual shipments. Assuming that its shipments corresponded with its production, its total for 1955 and 1956 was more than 120 thousand pounds, but less than one-tenth of one per cent in 1955 and less than two-tenths of one per cent of the industry total in 1956. Continental Copper and Steel Industries, Inc. shipped less than one-tenth of one per cent in 1959. General Electric Company shipments ranged from less than two-tenths of one per cent in 1955 to less than four-tenths of one per cent of the BDSA total in 1959. Narragansett Wire Company shipped less than one-tenth of the BDSA total in 1958 and 1959. Triangle Conduit and Cable Company shipments ranged from less than two-tenths of one per cent in 1957 to less than one-tenth of one per cent of the BDSA total in 1955. The addition of these shipments to the BDSA total would change no market share by more than two-tenths of one percentage point. Percentages may not sum to 100 because of rounding of numbers.

3/ Shipments by Kaiser were estimated by subtracting the shipments reported to the Department of Justice by the other integrated companies from the total shipments of all integrated companies. The sources of the total shipments of all integrated companies are U. S. Department of Commerce, BDSA, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-integrated Producer, 1950-1957", May 7, 1958, p. 1, and "Gross Shipments of Aluminum Wire by Integrated and Nonintegrated Producers, 1954-1957", November 8, 1961, for the years 1955 through 1957 and "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-integrated Producers, 1958-1960", November 17, 1961, for the years 1958 and 1959.

4/ Acquired by Kaiser on February 11, 1957. Bristol plant shipments are included in Kaiser shipments for all of 1957 as well as 1958 and 1959.

5/ Acquired by Olin Mathieson on May 6, 1957. Southern Electrical shipments are listed as shipments by Olin for all of 1957 as well as 1958 and 1959.

6/ Roebling has been owned by Colorado Fuel and Iron Corp. since 1952. Most of the conductor wire and cable machinery of Roebling was purchased by Reynolds Metals Company in March 1961.

7/ Shipments for all years based on information supplied by Essex Wire Corporation to the Department of Justice. Essex based the figures for 1955, 1956, and 1959 on reports to BDSA, but Essex estimated shipments for some months in 1957 and 1958.

8/ The Okonite Company was acquired by Kennecott Copper Corporation on November 24, 1958.

9/ Westinghouse shipped between 10 and 50 thousand pounds in 1958, and between 50 and 100 thousand poinds in 1955 and 1959.

10/ Four other firms are known to have reported some shipments of aluminum conductor wire and cable to BDSA. Central Cable Corporation supplied the Department of Justice no information on its shipments. The American Steel and Wire Division of the United States Steel Corporation reported to BDSA in 1955, 1956, and 1957, shipments amounting to less than one-tenth of one per cent of the industry total reported to BDSA. In 1958 and 1959 this company's shipments were less than 10 thousand pounds per month and therefore not reported. The

[illegible], and its shipments were spread evenly over the twelve months could it produce 120 thousand non-reportable pounds in any calendar year. In 1955, the year with the lowest industry total, 120 thousand pounds would be less than seven-hundredths of one per cent of the industry total. Individual company reports to the Department of Justice, however, show that six firms shipped more than 120 thousand pounds in one or more of these years, but did not report their shipments to BDSA. Circle Wire and Cable Corporation unreported shipments in excess of 120 thousand pounds ranged from less than one-tenth of one per cent in 1957 to less than three-tenths of one per cent of the BDSA industry total in 1959. Collyer Insulated Wire Company reported to the Department of Justice its use of aluminum wire and cable in its production of insulated products, rather than its actual shipments. Assuming that its shipments corresponded with its production, its total for 1955 and 1956 was more than 120 thousand pounds, but less than one-tenth of one per cent in 1955 and less than two-tenths of one per cent of the industry total in 1956. Continental Copper and Steel Industries, Inc. shipped less than one-tenth of one per cent in 1959. General Electric Company shipments ranged from less than two-tenths of one per cent in 1955 to less than four-tenths of one per cent of the BDSA total in 1959. Narragansett Wire Company shipped less than one-tenth of the BDSA total in 1958 and 1959. Triangle Conduit and Cable Company shipments ranged from less than two-tenths of one per cent in 1957 to less than one-tenth of one per cent of the BDSA total in 1955. The addition of these shipments to the BDSA total would change no market share by more than two-tenths of one percentage point. Percentages may not sum to 100 because of rounding of numbers.

3/ Shipments by Kaiser were estimated by subtracting the shipments reported to the Department of Justice by the other integrated companies from the total shipments of all integrated companies. The sources of the total shipments of all integrated companies are U. S. Department of Commerce, BDSA, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-integrated Producer, 1950-1957", May 7, 1958, p. 1, and "Gross Shipments of Aluminum Wire by Integrated and Nonintegrated Producers, 1954-1957", November 8, 1961, for the years 1955 through 1957 and "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-integrated Producers, 1958-1960", November 17, 1961, for the years 1958 and 1959.

4/ Acquired by Kaiser on February 11, 1957. Bristol plant shipments are included in Kaiser shipments for all of 1957 as well as 1958 and 1959.

5/ Acquired by Olin Mathieson on May 6, 1957. Southern Electrical shipments are listed as shipments by Olin for all of 1957 as well as 1958 and 1959.

6/ Roebling has been owned by Colorado Fuel and Iron Corp. since 1952. Most of the conductor wire and cable machinery of Roebling was purchased by Reynolds Metals Company in March 1961.

7/ Shipments for all years based on information supplied by Essex Wire Corporation to the Department of Justice. Essex based the figures for 1955, 1956, and 1959 on reports to BDSA, but Essex estimated shipments for some months in 1957 and 1958.

8/ The Okonite Company was acquired by Kennecott Copper Corporation on November 24, 1958.

9/ Westinghouse shipped between 10 and 50 thousand pounds in 1958, and between 50 and 100 thousand poinds in 1955 and 1959.

10/ Four other firms are known to have reported some shipments of aluminum conductor wire and cable to BDSA. Central Cable Corporation supplied the Department of Justice no information on its shipments. The American Steel and Wire Division of the United States Steel Corporation reported to BDSA in 1955, 1956, and 1957, shipments amounting to less than one-tenth of one per cent of the industry total reported to BDSA. In 1958 and 1959 this company's shipments were less than 10 thousand pounds per month and therefore not reported. The Collyer Insulated Wire Company filed reports with BDSA in 1958 and 1959, but indicated shipments less than 10 thousand pounds per month. The Crescent Insulated Wire and Cable Company filed reports with BDSA, but its shipments averaged less than 10 thousand pounds per month for all years except 1956 for which the company reported to the Department of Justice 112 thousand pounds for the first eight months only.

The Business and Defense Services Administration requires reports only for months in which total shipments of aluminum products a firm amounted to 10 thousand or more pounds. Thus the maximum amount that a firm could ship in a year and not be required to port would be under 120 thousand pounds per year of all aluminum products. Only if a firm produced only aluminum wire and cable, nsulated or covered, and its shipments were spread evenly over the twelve months could it produce 120 thousand non-reportable pounds any calendar year. In 1955, the year with the lowest industry total, 120 thousand pounds would be less than three-tenths of e per cent of the industry total. Individual company reports to the Department of Justice, however, show that six firms shipped ore than 120 thousand pounds in one or more of these years, but did not report their shipments to BDSA. Circle Wire and Gable orporation shipments ranged from less than one-tenth of one per cent in 1955 and 1956 to one per cent of the BDSA total in 1959. ollyer Insulated Wire Company reported to the Department of Justice its use of aluminum wire and cable in its production of insulated roducts rather than its actual shipments. Assuming that its shipments corresponded with its production, its total for 1955 and 1956 as more than 120 thousand pounds, but less than one-half of one per cent of the BDSA industry total. Continental Copper and Steel ndustries, Inc., shipped less than four-tenths of one per cent in 1959. General Electric Company shipments ranged from six-tenths f one per cent in 1955 to one and a half per cent in 1959. Narragansett Wire Company shipped three-tenths of one per cent of the BDSA otal in 1958 and four-tenths of one per cent of the BDSA total in 1959. Triangle Conduit and Cable Company shipments ranged from even-tenths of one per cent in 1957 to less than one-tenth of one per cent in 1959. The combined shipments of these companies ranged rom one per cent in 1955 to two and a half per cent in 1959. The addition of these shipments to BDSA total would change no market share y more than six-tenths of one percentage point. Percentages may not sum to 100 because of rounding of numbers.

2/ Shipments by Kaiser Aluminum were estimated by subtracting the shipments reported to the Department of Justice by the other integrated companies from the total shipments of all integrated companies. The sources of the total shipments of all integrated companies are U.S. Department of Commerce, Business and Defense Services Administration, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Wire by Integrated and Nonintegrated Producers 1954-1957", November 8, 1961, for the years 1955 through 1957; from "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers for the years 1958-1960", November 17, 1961, for the years 1958 and 1959.

3/ Acquired by Kaiser on February 11, 1957. Bristol plant shipments are included in Kaiser shipments for all of 1957 as well as 1958 and 1959.

4/ Acquired by Olin Mathieson on May 6, 1957. Southern Electrical shipments are listed as shipments by Olin for all of 1957 as well as 1958 and 1959.

5/ Division of Colorado Fuel and Iron Corp. Most of the aluminum wire and cable machinery of Roebling was purchased by Reynolds in March 1961.

6/ Shipments of all years based on information supplied by Essex to the Department of Justice. Essex based the figures for 1955, 1956, and 1959 on reports to BDSA, but Essex estimated shipments for some months in 1957 and 1958.

7/ The Okonite Company was acquired by Kennecott Copper Corporation on November 24, 1958.

8/ Westinghouse shipped between 10 and 50 thousand pounds in 1958, and between 50 and 100 pounds in 1955 and 1959.

9/ Five other firms are known to have reported some shipments of aluminum wire and cable, insulated or covered, to BDSA. Central Cable Corporation supplied the Department of Justice no information on its shipments. The American Steel and Wire Division of the United States Steel Corporation reported to BDSA in 1955, 1956, and 1957, shipments amounting to less than one-half of one per cent of the industry total reported to BDSA. In 1958 and 1959 this company's shipments were less than 10 thousand pounds per month and therefore not reported. The Collyer Insulated Wire Company filed reports with BDSA in 1958 and 1959, but indicated shipments less than 10 thousand pounds per month. The Crescent Insulated Wire and Cable Company filed reports with BDSA, but its shipments averaged less than 10 thousand pounds per month for all years except 1956 for which the company reported to the Department of Justice for the first eight months only. Nehring Electrical Works reported less than one-tenth of one per cent of the industry total in 1958 and 1959.

Sources: Alcoa and Rome shipments from Defendants' Answers to Plaintiff's Interrogatories, Answer to Interrogatory 1; other company shipments.

eport would be under 120 thousand pounds per year of all aluminum products. Only if a firm produced only aluminum wire and cable, nsulated or covered, and its shipments were spread evenly over the twelve months could it produce 120 thousand non-reportable pounds n any calendar year. In 1955, the year with the lowest industry total, 120 thousand pounds would be less than three-tenths of ne per cent of the industry total. Individual company reports to the Department of Justice, however, show that six firms shipped ore than 120 thousand pounds in one or more of these years, but did not report their shipments to BDSA. Circle Wire and Cable orporation shipments ranged from less than one-tenth of one per cent in 1955 and 1956 to one per cent of the BDSA total in 1959. ollyer Insulated Wire Company reported to the Department of Justice its use of aluminum wire and cable in its production of insulated roducts rather than its actual shipments. Assuming that its shipments corresponded with its production, its total for 1955 and 1956 as more than 120 thousand pounds, but less than one-half of one per cent of the BDSA industry total. Continental Copper and Steel ndustries, Inc., shipped less than four-tenths of one per cent in 1959. General Electric Company shipments ranged from six-tenths f one per cent in 1955 to one and a half per cent in 1959. Narragansett Wire Company shipped three-tenths of one per cent of the BDSA total in 1958 and four-tenths of one per cent of the BDSA total in 1959. Triangle Conduit and Cable Company shipments ranged from seven-tenths of one per cent in 1957 to less than one-tenth of one per cent in 1959. The combined shipments of these companies ranged from one per cent in 1955 to two and a half per cent in 1959. The addition of these shipments to BDSA total would change no market share by more than six-tenths of one percentage point. Percentages may not sum to 100 because of rounding of numbers.

2/ Shipments by Kaiser Aluminum were estimated by subtracting the shipments reported to the Department of Justice by the other integrated companies from the total shipments of all integrated companies. The sources of the total shipments of all integrated companies are U.S. Department of Commerce, Business and Defense Services Administration, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Wire by Integrated and Nonintegrated Producers 1954-1957", November 8, 1961, for the years 1955 through 1957; from "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers for the years 1958-1960", November 17, 1961, for the years 1958 and 1959.

[fol. 5906]

1/ Shipments of aluminum conductor wire and cable are the sum of the shipments of aluminum wire, insulated or covered, and ACSR and aluminum cable, bare.

2/ Shipments by Kaiser were estimated by subtracting the shipments reported to the Department of Justice by the other integrated companies from the total shipments of all integrated companies included in U. S. Department of Commerce, BDSA, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-integrated Producers, 1950 - 1957," May 7, 1958, p. 1 and "Gross Shipments of Aluminum Wire by Integrated and Nonintegrated Producers 1954 - 1957," November 8, 1961, for the years 1955 through 1957, and "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers, 1958 - 1960," November 17, 1961, for the years 1958 and 1959.

3/ The Anaconda Company became a producer of primary aluminum in late 1955.

4/ Bristol plant shipments are included in the Kaiser figure for all of 1957 and thereafter. This plant was acquired by Kaiser on February 11, 1957.

5/ Olin Mathieson became a producer of primary aluminum in 1958, through a jointly owned subsidiary, Ormet Corporation. Southern Electricel Corporation was acquired by Olin Mathieson on May 6, 1957, and its shipments were reported to BDSA as shipments of Olin after that date, and are included as integrated for all of 1958.

6/ If General Cable Corporation were treated as an integrated company after the entry of Ormet Corporation, because of the intercorporate stock relationship among General Cable, American Smelting and Refining Company, Revere Copper, and Ormet Corporation, then the integrated companies' share would be 87.6 percent in 1958 and 86.7 percent in 1959.

7/ Rome's shipments are treated as integrated for the whole year 1959.

Sources: Alcoa and Rome shipments from Defendants' Answers to Plaintiff's Interrogatories, Answer to Interrogatory 1; other company shipments, except as indicated in footnotes, from letters from individual companies to the Department of Justice; total industry shipments from U. S. Department of Commerce, Business and Defense Service Administration, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers, 1950 - 1957," May 7, 1958, "Gross Shipments of Aluminum Wire by Integrated and Nonintegrated Producers 1954 - 1957," November 8, 1961, and "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers, 1958 - 1960," November 17, 1961.

1/ Shipments by Kaiser Aluminum were estimated by subtracting the shipments reported to the Department of Justice by the other integrated companies from the total shipments of all integrated companies included in U. S. Department of Commerce, BDSA, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-integrated Producers, 1950-1957," May 7, 1958, p. 1, for the years 1955-1957, and "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers, 1958-1960," November 17, 1961, for the years 1958 and 1959.

2/ The Anaconda Company became a producer of primary aluminum in late 1955.

3/ Bristol plant shipments are included in the Kaiser figure for all of 1957 and thereafter. This plant was acquired by Kaiser on February 11, 1957.

4/ Olin Mathieson became a producer of primary aluminum in 1958, through a jointly owned subsidiary, Ormet Corporation. Southern Electrical Corporation was acquired by Olin Mathieson on May 6, 1957, and its shipments were reported to BDSA as shipments of Olin after that date and are included as integrated for all of 1958.

5/ If General Cable Corporation were treated as an integrated company after the entry of Ormet Corporation, because of the intercorporate stock relationship among General Cable, American Smelting and Refining Company, Revere Copper, and Ormet Corporation, then the integrated companies' share would be 91.3 percent in 1958 and 89.1 percent in 1959.

6/ Rome's shipments are treated as integrated for the whole year 1959.

Sources: Alcoa and Rome shipments from Defendants' Answers to Plaintiff's Interrogatories, Answer to Interrogatory 1; other company shipments, except as indicated in footnotes, from letters from individual companies to the Department of Justice, total industry shipments from U. S. Department of Commerce, Business and Defense Services Administration, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers, 1950-1957;" May 7, 1958, and "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-integrated Producers, 1958-1960," November 17, 1961, adjusted as indicated in footnotes.

1/ Shipments by Kaiser Aluminum were estimated by subtracting the shipments reported to the Department of Justice by the other integrated companies from the total shipments of all integrated companies included in U. S. Department of Commerce, Business and Defense Services Administration, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Wire by Integrated and Nonintegrated Producers 1954-1957," November 8, 1961, for the years 1955 through 1957; from "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-integrated Producers, 1958-1960," November 17, 1961, for the years 1958 and 1959.

2/ The Anaconda Company became a producer of primary aluminum in late 1955.

3/ Bristol plant shipments are included in the Kaiser figure for all of 1957 and thereafter. This plant was acquired by Kaiser on February 11, 1957.

4/ Olin Mathieson became a producer of primary aluminum in 1958, through a jointly owned subsidiary, Ormet Corporation. Southern Electrical Corporation was acquired by Olin Mathieson on May 6, 1957, and its shipments were reported to HDSA as shipments of Olin after that date, and are included as integrated for all of 1958.

5/ If General Cable Corporation were treated as an integrated company after the entry of Ormet Corporation, because of the intercorporate stock relationship among General Cable, American Smelting and Refining Company, Revere Copper, and Ormet Corporation, then the integrated companies' share would be 65.4 percent in 1958 and 68.1 percent in 1959.

6/ Rome's shipments are treated as integrated for the whole year 1959.

Sources: Alcoa and Rome shipments from Defendants' Answers to Plaintiff's Interrogatories, Answer to Interrogatory 1; other company shipments, except as indicated in footnotes, from letters from individual companies to the Department of Justice, total industry shipments from U. S. Department of Commerce, Business and Defense Services Administration, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Wire by Integrated and Nonintegrated Producers 1954-1957," November 8, 1961, and "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers, 1958-1960," November 17, 1961, adjusted as indicated in footnotes.

s of Nonintegrated Firms as reported by Business and Defense Services Administration revised to exclude nda Wire and Cable Company in 1956 and 1957, and Bristol for all of 1957.

Rome shipments from Defendants' Answers to Plaintiff's Interrogatories, Answer to Interrogatory 1; total shipments of nonintegrated firms from U.S. Department of Commerce, Business and Defense Services Administration, Aluminum and Magnesium Division, "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers, 1950-1957," May 7, 1958, and "Gross Shipments of Aluminum Mill Shapes by Integrated and Nonintegrated Producers, 1958-1960," November 17, 1961, and individual company letters to Department of Justice.

[fol. 5912] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 442

Companies Listed as Producing Aluminum Conductor Wire and Cable [1] in the U. S. Department of Commerce BDSA Directory of Aluminum Suppliers, Dated April 1, 1961, but not listed in the Directory for June 30, 1955

Olin Mathieson Chemical Corporation [2]
Hatfield Wire and Cable Corporation Division of Continental Copper and Steel Industries
Circle Wire and Cable Corporation, Subsidiary of Cerro Corporation [3]

---

[1] The Directory of Aluminum Suppliers is broken down into a number of categories. This tabulation lists all companies that were listed in either the "ACSR and Aluminum Cable, bare" category or the "Wire and Cable, insulated or covered" category in the 1961 directory but not listed in either category in the 1955 directory.

[2] The Olin Mathieson Chemical Corporation displaced Southern Electrical Corporation which company was acquired by Olin Mathieson on May 6, 1957.

[3] While Circle Wire and Cable Corporation is not listed as a producer of these products in the directory for June 30, 1955, but Circle indicated in a letter to the Department of Justice dated August 22, 1961, that it did manufacture aluminum conductor wire in 1955.

[fol. 5913] IN UNITED STATES DISTRICT COURT

PLAINTIFF'S EXHIBIT 443

Shipments of Aluminum Weatherproof and Service Drop Wire and Cable Compared with Total Shipments of Aluminum Wire and Cable, Insulated or Covered, by Six Companies,[1] 1959.

Company	Total Insulated or Covered[2]	Weatherproof and Service Drop[2]	Weatherproof and Service Drop as Percent of Total Insulated or Covered
Aluminum Company of America	7,550	7,550	100.0
Rome Cable Corporation	2,677	2,438	91.1
Anaconda Wire and Cable Company	11,476	11,017	96.0
General Cable Corporation	46,704[3,4]	45,902[3]	98.3
Kaiser Aluminum & Chemical Corp.	15,356	11,092	72.2
Southwire Company	2,388	2,384	99.8

[1] These six companies in 1959 shipped 73.5 percent of all shipments of aluminum wire and cable, insulated or covered, reported to BDSA. These six are the only companies for which the Department of Justice has data on weatherproof and service drop shipments that are comparable with data on total insulated or covered shipments.

[2] Thousands of pounds of aluminum content except where indicated otherwise.

[3] Measured in feet.

[4] The letter from General Cable says sales of some other unspecified aluminum insulated wire and cable amounted to "a small fraction of one percent." This figure is based on the assumption that the unspecified sales were exactly one percent.

Sources: Alcoa and Rome figures from Defendants' Answers to Plaintiff Interrogatories numbers 5 and 4, respectively; other figures from individual company letters to the Department of Justice.

[fol. 5926] I. Purpose and Scope of This Study

The information contained herein has been prepared for the purpose of showing the extent to which aluminum and copper conductor is used for gross additions to overhead electric lines and underground electric cables in the United States. The study covers the period from 1950 to 1959 inclusive. The extent to which aluminum and copper conductor is employed in overhead electric lines and underground cables by electric utilities is an indication of the use of such conductor for these purposes since almost all of these lines and cables in the United States are constructed by electric utilities.

II. Conclusions

The following conclusions in regard to the use of aluminum conductor, aluminum alloy conductor and aluminum conductor steel reinforced (hereinafter collectively referred to as aluminum conductor) and of copper conductor are based upon information furnished by electric utilities which in 1958 supplied electric service to over half of the ultimate consumers in the United States.

1. Aluminum conductor was the dominant conductor used in 1959 for gross additions to overhead electric lines, being employed for 80.1 percent of these additions.
2. A continuing trend toward an increasing use of aluminum conductor for gross additions to each of the three major categories of overhead electric lines occurred over the period from 1950 to 1959 inclusive, as may be seen in the following tabulation.

fol. 5927]

Overhead Lines	% Aluminum Conductor		
	1950	1955	1959
Transmission Lines	74.4	91.0	94.4
Distribution Lines	35.5	64.4	79.0
Bare Conductor	6.5	51.6	77.2
Covered & Insulated Conductor	25.0	60.9	80.1
Total[1]			

3. The trend toward increasing use of aluminum conductor for overhead electric lines over the period from 1950 to 1959 inclusive was:

a. Found throughout the United States in all seven geographical regions.
b. Present for all three types of electric utility in the electric industry.

4. Copper conductor was the dominant conductor used in 1959 for gross additions to underground electric cables, being employed for 97.7 percent of these additions.
5. No appreciable trend away from the use of copper conductor underground cable occurred over the period from 1950 to 1959 inclusive as may be seen in the following tabulation. Although a small amount of aluminum conductor underground cable was used in 1955 and 1959 only two of the utilities using it indicate an intention to use it again in the foreseeable future.

Underground Cables	% Copper Conductor		
	1950	1955	1959
Transmission	100.0	100.0	100.0
Distribution	100.0	98.7	97.5
Total[1]	100.0	98.8	97.7

[1] Based upon total gross additions of transmission and distribution conductor.

[fol. 5928]

III. Findings

Overhead Conductor

General:

The amount of aluminum conductor compared with the total of aluminum and copper conductor used for gross additions to overhead electric lines of the utilities supplying information (hereinafter referred to as relative use of aluminum conductor) increased substantially during the period covered by this study from 1950 to 1959 inclusive. This increase was accompanied by a corresponding decrease in the relative use of copper conductor. The major part of the increase took place during the period from 1950 to 1955. Although the relative use of aluminum conductor continued to increase during the period from 1955 to 1959 it was at a slightly slower rate. This can be seen in Figure 1.

The same general trend has been present in each of the

seven geographical regions in the continental United States as may be seen in Figure 2.

The rapidity of the increase in the relative use of aluminum conductor on overhead electric lines is indicated by the fact that in 1950 this was only 25.0 percent whereas in 1955 it was 60.9 percent and in 1959 it was 80.1 percent. The relative use in 1955 was therefore approximately 2.4 times the relative use in 1950 and the relative use in 1959 was about 3.2 times the relative use in 1950.

Transmission Conductor:

The relative use of aluminum conductor for gross additions to overhead transmission lines of the utilities supplying information increased from 74.4 percent in 1950 to 94.4 percent in 1959 as may be seen from Figure 3. The relative use in 1959 was accordingly approximately 1.3 times the relative use in 1950 which is a com-

[fol. 5929]

1950 – 1959

[fol. 5932] paratively small increase. This is due to the fact that aluminum conductor has been used to an increasing extent on overhead electric transmission lines until the area left for expanded use is small.

Overhead Distribution Conductor:

The relative use of bare aluminum conductor for gross additions to overhead distribution lines of the utilities supplying information increased from 35.5 percent in 1950 to 79.0 percent in 1959 as may be seen in Figure 4. The relative use in 1959 was accordingly about 2.2 times the relative use in 1950.

The relative use of covered and insulated aluminum conductor for gross additions to overhead distribution lines of the electric utilities supplying information increased rapidly from 6.5 percent in 1950 to 77.2 percent in 1959 as may be seen in Figure 5. The relative use in 1959 was therefore about 11.9 times the relative use in 1950.

The percentages used in making Figures 1 to 5 inclusive are shown in Table 1. These percentages have been computed from data supplied by the electric utilities.

Underground Conductor

No aluminum conductor was used for underground electric cables in 1950 by the utilities supplying information. In 1955 some aluminum conductor was used for this purpose by two utilities located in Region I making the relative usage in the continental United States 1.2 percent. In 1959 aluminum conductor was used for this purpose by seven utilities located in 4 different regions making the relative usage in the continental United States 2.3 percent as may be seen in Figure 6.

Aluminum conductor used in underground cable in 1955 and 1959 was for distribution with none being used for transmission. The usage of aluminum conductor resulted in a very slight decrease in

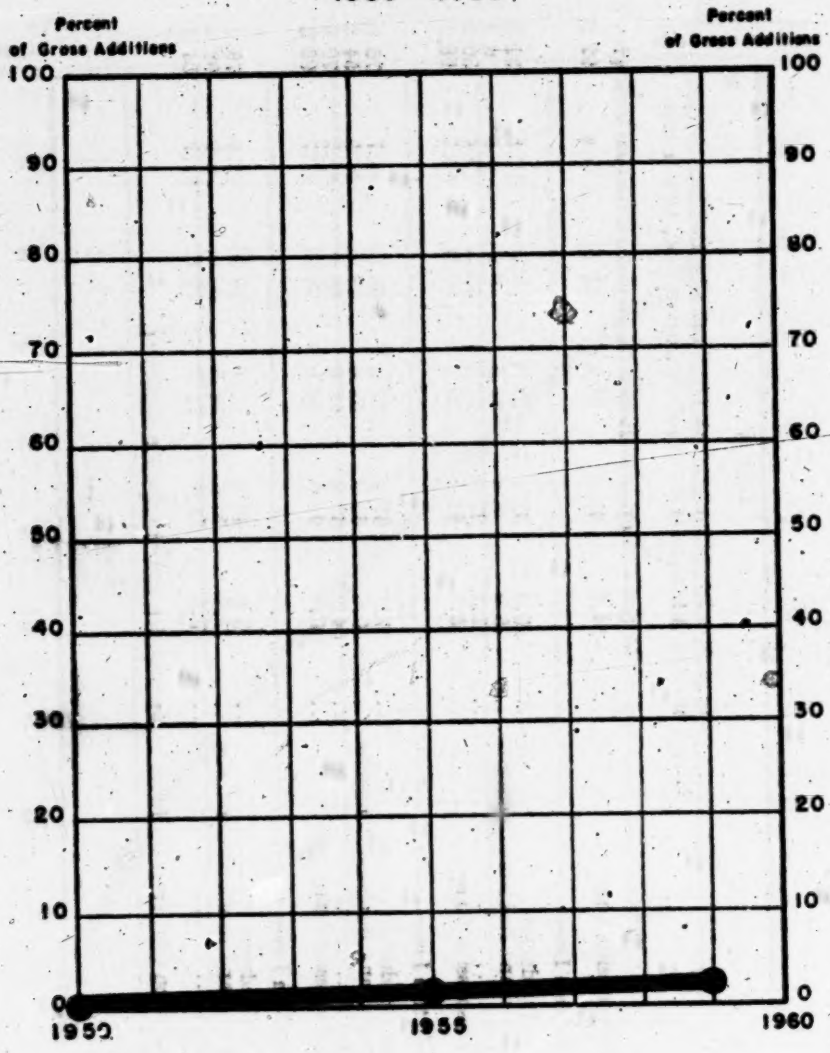
[fol. 5936]

Figure 6
Trend in Use of Aluminum Conductor
in Underground Electric Cables
1950 — 1959



[fol. 5937] the use of copper conductor as may seen in Figure 7.

The percentages used in making Figure 7 are shown in Table 2 which also shows the percentages for each of the seven geographical region and for transmission and distribution cable separately. The percentages have been computed from data supplied by the utilities. The percentages in Figure 6 are the difference between the percentage in Figure 7 and 100 percent.

The information supplied by electric utilities indicates there is no basis at the present time to expect widespread usage of aluminum conductor for underground electric cable in the continental United States. Only one of the utilities that used this type of conductor has indicated an intention to use more of it. One other utility expects no change in the amount of aluminum conductor used for underground cable and all the others indicate they do not intend to use it in the future.

The procedures followed in obtaining information about the use of aluminum and copper conductor for electric lines and cables is discussed in Appendix A.

Ellery R. Fosdick, Consulting Engineer.

[fol. 5940] Appendix A

[fol. 5941] *Procedure Followed in Making This Study*
Definition of Terms and Expressions

The following definitions of terms and expressions used subsequently herein were approved by the American Standards Association August 12, 1941.

A *wire* is a slender rod or filament of drawn metal.

A *conductor* is a wire or combination of wires not insulated from one another, suitable for carrying electric current.

A *stranded conductor* is a conductor composed of a group of wires, or any combination of groups of wires.

Note: The wires in a stranded conductor are usually twisted or braided together.

A *cable* is either a stranded conductor (single conductor cable), or a combination of conductors insulated from one another (multiple conductor cable).

A *bare conductor* is a conductor not covered with insulating material.

Insulated means separated from other conducting surfaces by a dielectric permanently offering a high resistance to the passage of current and to disruptive discharge.

Note: When any object is said to be insulated, it is understood to be insulated in a suitable manner for the conditions to which it is subjected.

An *open-wire* circuit is a circuit made up of conductors separately supported on insulators.

Note: The conductors are usually bare wire, but they may be insulated by some form of continuous insulation. The insulators are usually supported by crossarms or brackets on poles.

An *aluminum conductor* is a conductor made wholly of aluminum.

[fol. 5942] An *aluminum steel conductor* is a composite conductor made up of a combination of aluminum and steel wires. In the usual construction the aluminum wires surround the steel.

Alternating-current transmission is the transfer of electric energy by alternating current from its source to one or more main receiving stations for subsequent distribution.

Note: Generally a voltage is employed which is higher than that which would be delivered or utilized by electrical machinery. Transformers of a capacity comparable to that of the line are usually employed as links between the high voltage transmission and lower voltage used for distribution or utilization.

Alternating-current distribution is the supply to points of utilization of electric energy by alternating current from its source or one or more main receiving stations.

Note: Generally a voltage is employed which is not higher than that which could be delivered or utilized by rotating electric machinery. Step-down transformers with a capacity much smaller than that of the line are usually employed as links between the moderate voltage of distribution and the lower voltage of the consumers apparatus.

Primary distribution mains are the conductors which feed from the center of distribution to direct primary loads or to transformers which feed secondary circuits.

Secondary distribution mains are the conductors connected to the secondaries of distribution transformers from which consumers' services are supplied.

The Service drop is that portion of the overhead service conductors between the last pole and the premises served extending from the last pole to the junction with the service entrance conductors.

[fol. 5943] *Source of Information*

Electric utilities are the best source of information regarding the use of copper and aluminum conductor for overhead lines and underground cables as almost all of these lines and cables in the United States are constructed by the utilities. In obtaining information from the electric utilities it was necessary to establish selection criteria that would keep the work within reasonable limits. As of January 1, 1959, there were 3,355 operating electric utilities in the continental United States serving communities with a population of 500 and over.* A total of 93 electric utilities were selected.

---

* McGraw-Hill Directory of Electric Utilities—1959.

Bases Used in Selecting Electric Utilities

General

Information about the amount and kind of overhead and underground electrical conductor used by electric utilities in the United States was not readily available. The largest electric utilities of each type in the 48 continental states of the United States were selected as a source of information because:

(1) They usually keep good records regarding matters such as the type and amount of copper and aluminum conductor used and were considered likely to have the desired information readily available.
(2) A relatively small number of large electric utilities supply service to a substantial proportion of the nation's customers, making it possible to obtain the desired information by fewer inquiries than would be the case if small utilities were selected.

[fol. 5944] Installed generating capacity was used as a basis for selecting the largest privately-owned and publicly-owned non-Federal electric utilities. This basis indicates in a general way the relative size of the large utilities since they usually generate most of their power requirements in their own plants. Furthermore electric utilities with a large amount of generating capacity generally require a relatively large amount of electrical conductor for the delivery of power to customers.

Publicly-owned Federal electric utilities were not included in the group from which selections were made. These utilities are concerned almost exclusively with the generation and/or transmission of electric energy to other electric utilities and use only a relatively small amount of distribution conductor.

The number of miles of electric line energized was used as a basis for selecting the largest rural electric cooperatives instead of installed generating capacity. Most of these cooperatives have little or no generating capacity but instead purchase part or all of their power requirements from others. The number of customers served was not used as a basis of selection since this is not a good indication of the

size of a rural electric cooperative. The density of customers served by rural electric cooperative lines varies with the nature of the areas served.

Data used in selecting electric utilities were for the year 1958 as this was the latest available at the time the work was started. Data used in selecting the privately owned electric utilities were taken from the 1958 report on "Statistics of Electric Utilities in the United States" for privately owned utilities published by the Federal Power Commission. Data used in selecting the publicly owned electric utilities were taken from the 1958 report on "Statistics of Electric Utilities in the United States" for publicly owned utilities published by the Federal Power Commission. Data used in [fol. 5945] selecting the rural electric cooperatives were taken from the "Annual Statistical Report" for 1958 of rural electrification borrowers, published by the Rural Electrification Administration.

These statistical reports cover a large proportion of the electric utility industry in the United States. The electric utilities listed in the reports had an average of 53,485,000 ultimate consumers in the United States in 1958 or approximately 96 percent of the total average of 55,689,790* ultimate consumers served by electric utilities.

In the Federal Power Commission report on privately owned electric utilities is the following statement. "It is estimated that these larger companies comprise, both on the basis of assets and of revenues in excess of 98 percent of the privately owned electric light and power industry".

The Federal Power Commission report on publicly owned electric utilities contains the following paragraph. "The electric utilities included in the summary statements which follow are limited to the larger publicly owned electric utilities exclusive of federally owned projects, which filed with the Commission annual reports for 1958. The proportion of the non-Federal publicly owned division of the electric utility industry represented by such utilities is estimated to be approximately 70 percent both on the basis of electric

---

* Average of number of ultimate consumers computed from number as of December 31, 1957 and December 31, 1958 given in Table 26 of Edison Electric Institute No. 27 Publication No. 60-14.

plant investment and of sales to ultimate consumers, and approximately 60 percent on the basis of revenues from ultimate consumers and number of ultimate consumers served, respectively".

The Rural Electrification Administration report on rural electrification cooperatives lists all such cooperatives in the United States, Alaska, Puerto Rico and the Virgin Islands, and supplies certain data for all the active energized borrowers. Only the active energized distribution type of bor- [fol. 5946] rowers in the United States were considered in selecting rural electric cooperatives for this study. The borrowers used in selecting cooperatives for this study comprise approximately 94 percent of all energized distribution type rural electric cooperatives in the continental United States. Former borrowers were not considered in the selection as no information about them was available. The power type of borrowers were not considered as they are concerned almost exclusively with the generation and transmission of electric energy to distribution type borrowers and use little distribution conductor. Refrigeration type of borrowers were not considered as they operate cold storage plants and use little electrical conductor.

Selection Criteria

Privately owned utilities

The largest electric utility serving domestic customers directly based upon the amount of generating capacity installed as of December 31, 1958, was selected in each state. All other smaller utilities were selected in each state which had an installed generating capacity of:

a. 1,000 MW or more or,
b. 75% or more of the installed generating capacity of the largest utility.

Publicly owned utilities include municipal systems, public utility districts, irrigation districts, county systems, mutual systems, Federal systems and state authorities.

The largest non-Federal publicly owned electric utility serving domestic customers directly based upon the amount of generating capacity installed as of December 31, 1958,

was selected in each of the seven geographical regions into which the United States has been divided by the Federal Power Commission. All other publicly owned non-Federal electric utilities were selected which had an installed generating capacity of 100 MW or more.

[fol. 5947] Rural Electric Cooperatives

The two largest rural electric cooperatives serving domestic customers directly based upon the miles of electric line energized as of December 31, 1958, were selected in each of the seven geographical regions into which the United States has been divided by the Federal Power Commission.

Electric Utilities Selected

A total of 93 electric utilities from which to request information were selected as a result of applying the selection criteria previously described. These include 66 privately owned utilities, 13 publicly owned utilities and 14 rural electric cooperatives. Utilities in each of these groups are well dispersed throughout the continental United States being located in each of the 7 geographical regions into which the United States has been divided by the Federal Power Commission as may be seen in the following summary. The utilities selected are also well distributed according to size based upon the amount of installed generating capacity with the largest number being in the small size group which has the largest number of utilities.

The electric utilities selected have 59 percent of the installed generating capacity in the United States based upon the data contained in the annual statistical reports for 1958 of the Federal Power Commission and Rural Electrification Administration and 63 percent of the ultimate consumers. That is, the utilities selected for this study have a combined installed generating capacity of 83,248,000 KW out of a total of 141,642,000 KW and 33,882,000 ultimate consumers out of a total of 53,485,000. The installed generating capacity of the electric utilities selected and the number of ultimate consumers served by them is shown below for each type of utility:

(1) Includes Federal Projects.
(2) Includes Power Type Borrowers.
(3) Includes ultimate consumers served by Federal Projects.
(4) Includes ultimate consumers served by Power Type borrowers.

The 93 electric utilities from which information was requested are listed in Appendix B showing the geographical region in which they are located, installed generating capacity and number of ultimate consumers for each and in addition the miles of line for rural electric cooperatives.

[fol. 5960] Procedure Used in Obtaining Information from Electric Utilities

A set of four schedules was transmitted to each of the 93 electric utilities selected. These schedules requested that information be supplied regarding the gross additions of overhead conductor and underground conductor to electric utility plant (Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance), expected changes in the amount of aluminum conductor used and limitations or restrictions to its use. The four schedules were designed to elicit objective factual information from officials of each utility. All of the 93 electric utilities to which the schedules were sent responded with varying degrees of completeness.

Approval of the four schedules and the letter of transmittal by the Bureau of the Budget was obtained as required under Circular A-40 dated October 24, 1951 that was promulgated under the authority of the Federal Reports Act of 1942. The Bureau of the Budget reviewed the schedules and letter in the light of their intended use to obtain infor-

mation from electric utilities to be selected by the criteria established.

A copy of the letter from the Bureau of the Budget dated September 28, 1960, approving the schedules and the letter of transmittal is attached as Appendix C. A copy of the letter used in transmitting the schedules and a copy of each of the four schedules sent to the electric utilities are attached as Appendix D.

The preparation of the four schedules for use by the electric utilities in supplying information regarding their gross additions of overhead electrical conductor and underground electrical conductor was simplified by the fact that terminology relating to much of the electric utility business in the United States has been standardized. Generally accepted terminology was used where ever practicable in the [fol. 5951] preparation of the schedules so as to facilitate to the maximum extent a correct understanding of the information desired.

Schedule I was for the purpose of obtaining information regarding the gross additions of overhead electrical conductor and Schedule II for gross additions of underground electrical conductor in each of the years 1950, 1955 and 1959. This information was to be supplied separately on each schedule for transmission conductor and distribution conductor with a further breakdown of overhead distribution conductor between bare conductor and insulated or covered conductor. The gross additions were to be given in thousands of feet of single conductor as it was thought this would be generally available and would provide a basis for indicating the relative usage of aluminum conductor compared with copper conductor.

Schedule III relating to overhead lines and Schedule IV relating to underground cables requested information about expected future changes in the proportion of gross additions of aluminum conductor to gross additions of copper conductor and also the limitations or restrictions that may exist in connection with using aluminum conductor.

The information to be supplied on Schedules III and IV was for the purpose of determining whether trends shown by the data supplied on Schedules I and II might be expected to continue or change. The questions were phrased to facili-

tate brief explicit answers to the maximum extent practicable.

The information to be supplied by the electric utilities on the schedules was consistent with the needs. Data regarding the gross additions of conductor to be submitted on Schedules I and II was requested for the years 1950, 1955 and 1959 as this period was sufficiently long and three different years in the period were adequate to indicate a trend.

Notice of Approval of Report Form

Date: September 28, 1960.

To: Mr. S. A. Andretta
Administrative Assistant Attorney General
Department of Justice
Subject: Agency's Form No.
Title: Form Letter and Schedules Attached Thereto (Use of Aluminum and Copper Wire and Cable)

The above-named form is hereby approved in accordance with Circular A-40 issued by the Bureau of the Budget under the Federal Reports Act of 1942.

The following notation of approval must be shown in the upper right-hand corner of the form:

Budget Bureau No. 43-6005
Approval Expires December 31, 1960

Will you please transmit to this Office two copies of this form after printing or other multicopying?

/s/ David E. Cohn, David E. Cohn, Clearance Officer,
Office of Statistical Standards.

The Department of Justice is seeking information as to the relative use by electric utilities of aluminum and copper conductor for new construction and for replacement. This information is necessary with respect to pending litigation, in which neither your utility nor any other electric utility is a party. We are enclosing schedules setting out the specific information desired, and it will be appreciated if you will cooperate in furnishing on these schedules the information requested.

In order that we may obtain the necessary information within time limitations imposed by the afore-mentioned litigation, your return of the completed schedules with the appropriate signature by October 31, 1960, will be appreciated.

Sincerely yours, Robert A. Bicks, Assistant Attorney General, Antitrust Division.

Enclosures

Schedule III

The Connecticut Light & Power Company
P. O. Box 2010, Hartford 1, Conn.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe th changes indicating when they will occur.

Over an extended period, proportion of aluminum to copper expected to increase since aluminum cable is primary standard for overhead construction. In distribution category, the ratio may be static in 1960 and 1961 as Company uses existing stocks of copper cable.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Use of aluminum restricted in areas adjacent to salt water because of connector corrosion problems.

Walter W. Foreman
Vice President
October 28, 1960

[fol. 5975] United States Department of Justice

Schedule IV

The Connecticut Light & Power Company
P. O. Box 2010, Hartford 1, Conn.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No change.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Aluminum Conductor Underground Cable is not in Company standards.
Restricted because of Space limitations (duct)

Thermal Expansion properties
Insulation economics
Connector problems

Schedule III

Delaware Power & Light Company
600 Market St., Wilmington 99, Del.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Estimated to continue in same proportion as in 1959.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No restriction.

F. P. Hyer
Chairman of The Board & Chief,
Executive Officer
October 31, 1960

[fol. 5979] United States Department of Justice

Schedule IV

Delaware Power & Light Company
600 Market St., Wilmington 99, Del.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Do not plan to use aluminum for underground cables.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Space limitation in existing ducts prevents use of aluminum.

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Dear Mr. Bicks:

At the telephonic request of Mr. Samuel Karp, Attorney, we are resubmitting the set of schedules relating to the use of aluminum and copper conductors in order to clarify and amplify the statements as originally submitted.

Schedules I & II have not been changed from the original. Schedule III has been amplified to show the estimated change in the proportion of aluminum to copper in 1960 over 1959 occasioned by the present practice of using aluminum conductors for overhead lines, except for distribution primaries, which was established late in 1959. Schedule IV has been restated to cover underground cables only.

Very truly yours, George Bisset, Senior Vice President.

[fol. 5981] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Potomac Electric Power Company
929 E St., N. W., Wash. 4, D. C.

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	—	—	—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	87	—	1,851
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	1,939	2,317	3,570
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	—	—	902
3. Copper wire and cable covered and insulated[3]	3,677	3,785	2,963
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	—	120	2

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

George Bisset
Senior Vice President
December 22, 1960

[fol. 5982] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1960, 1955 and 1959

Potomac Electric Power Company
929 E St., N. W., Wash. 4, D. C.

Type of Underground Cable	Answer in Thousands of Feet[2] 1960	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	373	134	177
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	1,373	1,012	1,695
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

George Bisset
Senior Vice President
December 22, 1960

[fol. 5983] United States Department of Justice

Schedule III

Potomac Electric Power Company
929 E St., N. W., Wash. 4, D. C.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Our present practice (established late in 1959) of using aluminum Conductors for overhead lines, except for distribution primaries for which copper is standard, will increase the proportion of aluminum to copper in 1960 over 1959. If we assume the quantities of Conductors installed in 1960 to be the same as in 1959 (no 1960 figures being available at this time), the following percentage usage should result.

	1959 Actual	1960 Estimated
Schedule B1 Bare Copper	79.8%	35.9%
B2 Bare Aluminum	20.2%	64.1%
B3 Ins. Copper	99.9%	4.3%
B4 Ins. Aluminum	0.1%	95.7%

We have no plans or schedule for changing this practice at the present time.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

The use of aluminum conductor is not restricted because of corrosion. Copper is preferred for distribution primaries because it is easier to install, maintain and rearrange, also it has greater salvage value. We have no highly corrosive atmosphere on this system.

George Bisset
Senior Vice President
December 22, 1960

[fol. 5984] United States Department of Justice

Schedule IV

Potomac Electric Power Company
929 E St., N. W., Wash. 4, D. C.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Our present practice is to use copper conductors for all underground lines. We have no plans or schedule for changing this practice, at this time.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do not use any aluminum conductors for underground cable because we have not found any price advantage on an installed basis. The use of aluminum for either conductor or sheath is not standard with the cable manufacturers. There have been experimental installations, but standard installation methods have not been developed.

George Bisset
Senior Vice President
December 22, 1960

[fol. 5986] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959
Baltimore Gas and Electric Company

Lexington and Liberty Streets,
Baltimore 3, Maryland

Type of Underground Cable & Wire	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	XXXXXXXX	XXXXXXXX	XXXXXXXX
1. Copper	—	2	—
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	XXXXXXXX	XXXXXXXX	XXXXXXXX
1. Copper	2,011	1,311	1,072
2. Aluminum & Alummum Alloy			

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

O. E. Smith
Secretary
October 31, 1960

[fol. 5987] United States Department of Justice

Schedule III

Baltimore Gas and Electric Company
Lexington and Liberty Streets,
Baltimore 3, Maryland

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We expect the proportion of aluminum to copper used in both transmission and distribution lines to increase in 1960 and in subsequent years.

New extensions are normally made with aluminum conductors. Lines that must be reconductored because of load growth are normally reconductored with aluminum. The old copper wires are scrapped if they are small in size or are damaged.

The substitution of aluminum conductors for copper is a continuing process and will therefore not occur in any particular future year.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

The use of aluminum conductors is somewhat limited in industrial areas due to chemical contamination. Copper conductors are normally used for 4 kv and higher voltage lines. Aluminum conductors are used for service drops and other secondary voltage lines. Aluminum conductors are normally covered.

This limitation was imposed to prevent possible corrosion and weakening of aluminum conductors. Continuing test work and experience indicate that our fears

of corrosion of aluminum conductors in these areas may be unfounded. However, no change in policy has yet been made since salvaged copper wire is generally available.

O. E. Smith
Secretary
October 31, 1960

[fol. 5988] United States Department of Justice

Schedule IV

Baltimore Gas and Electric Company
Lexington and Liberty Streets,
Baltimore 3, Maryland

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No change contemplated.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Economic consideration only.

Manager
October 19, 1960

[fol. 5992] United States Department of Justice

Schedule III

Choptank Electric Cooperative, Inc.,
Denton, Maryland

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

A.

Bare Wire

We expect an increase in the proportion of aluminum to copper wire over that of 1959. Most lines that are rebuilt due to increased load are built from aluminum. This is not reflected in the 1959 figure since no lines were rebuilt in that year. The 1955 figure is a truer picture of the proportions of aluminum to copper expected in the future.

Covered Wire

We expect the proportion of aluminum to copper wire to remain the same as 1959.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

B.

We restrict the use of aluminum for lines within two miles of the ocean because of corrosion of connections. No change is expected in this restriction.

F. E. Yeoman
Manager
October 19, 1960

[fol. 5993] United States Department of Justice

Schedule IV

Choptank Electric Cooperative, Inc., Denton, Maryland

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

None.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

None.

Atten: Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division

Dear Mr. Bicks:

In accordance with our telephone conversation with Mr. Karp of December 5, 1960 we are enclosing herewith by AIR-MAIL a revised set of schedule forms.

Please note the average 50 foot length of service drops have been broken down according to actual number of strands used in each service rather than using an average of three strands. This changes the estimate slightly from what was quoted by telephone December 5th.

Bare and covered wire as originally reported in schedule 1B, have been revised to include service drops.

We regret the inconvenience this has caused you.

Sincerely yours, Ralph M. Kelmon, Assistant Treasurer.

RMK/NCE/mal

Schedule III

Boston Edison Company
182 Tremont Street, Boston 12, Massachusetts

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

About the same through 1961. Beyond that, it is dependent upon costs.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

Use of Aluminum versus Copper for Service Drops

1. Approximately 90% of wire used for service drops is aluminum. For the most part, three strand, number four wire is used for residential not withstanding it is only 80% as good as copper in conductivity.
2. Three strand, number 1/0 or 3/500 copper wire which is larger wire is primarily used for commercial service drops because it is a better conductor for load requirements.

Type of Underground Cable	Answer in Thousands of Feet[2] (A) 1950	(B) 1955	(C) 1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	12	143	106
2. Aluminum & Aluminum Alloy	None	None	None
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	1,354	1,816	2,007
2. Aluminum & Aluminum Alloy	None	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.
(A) Does not include the length of 2,147 U.G. Services.
(B) Does not include the length of 2,265 U.G. Services.
(C) Does not include the length of 1,034 U.G. Service.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Albert C. McMenimen

Att: Robert A. Bicks, Ass't Attorney General

Gentlemen:

We have every desire to cooperate with the Department of Justice in supplying information as to the use by our Company of aluminum and copper conductor as requested in your letter of October 11, 1960.

However, the amount of work involved in collecting the information is so great that we can supply estimates only for the year 1955 and 1959, but have no readily available source of information for the year 1950.

You will find our estimates set forth on the sheets enclosed.

Yours very truly, A. R. Schiller, President.

Schedule III

Public Service Co. of N. H.
1087 Elm Street
Manchester, N. H.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No anticipated change.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No restrictions imposed.

Public Service Co. of N. H.
October 25, 1960

[fol. 6013] United States Department of Justice

Schedule IV

Public Service Co. of N. H.
1087 Elm Street
Manchester, N. H.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No anticipated change.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Aluminum conductor has never been used in present underground system. Size of existing ducts and space limitations could be considered as primary reason.

Schedule III

Public Service Electric and Gas Company
80 Park Place
Newark 1, New Jersey

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No change in the present proportionate use of aluminum and copper is foreseen. If the two metals change radically in relative price, the use will be re-evaluated.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No restrictions.

(Signature illegible)
General Supt. of Distribution
November 2, 1960

[fol. 6017] United States Department of Justice

Schedule IV

Public Service Electric and Gas Company
80 Park Place
Newark 1, New Jersey

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Same answer as Schedule III A.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Insulated aluminum conductors are acceptable underground only when provided with metallic sheath. Such cables may at certain places be limited by available duct size. This limitation, while completely general, becomes of practical nature on rare occasions.

Merle W. Smedberg
Superintendent of Public Utilities
October 20, 1960

[fol. 6021] United States Department of Justice

Schedule III

Jamestown Municipal Electric System
200 East Third Street
Jamestown, New York

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We have started to use aluminum and aluminum alloy wire covered and insulated in the form of triplex conductor for service drops. It is expected that more of this type of conductor will be used in the future. We are also checking the economics of using covered aluminum alloy wire on distribution lines.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

There is no area in our service area in which we would restrict the use of aluminum conductor.

Merle W. Smedberg
Superintendent of Public Utilities
October 20, 1960

[fol. 6022] United States Department of Justice

Schedule IV

Jamestown Municipal Electric System
200 East Third Street
Jamestown, New York

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Inasmuch as our underground cable installations will be replacements during this year and next year, we will continue the use of copper type of cable for replacements.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Washington, D. C.
Your Reference No. 60-0-37-256

Dear Sir:

Enclosed herewith are the schedules which were furnished with your letter dated October 11, 1960.

The information requested in the schedules has been supplied with the exception of data concerning gross additions of electric conductors in the year 1950. Our records for that period, and for several subsequent years, are not in a form that permits this information to be extracted without the expenditure of a substantial amount of time and consequent disruption of other activities. We know, however, that aluminum conductors were generally introduced into the system after 1950. If the information is deemed essential for your purposes, we will undertake to supply it but it would take two to three weeks to make it available.

Very truly yours, Charles R. Pierce.

encls.

[fol. 6024] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Long Island Lighting Company
250 Old Country Road, Mineola, New York

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	*	1,131	437
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	*	228	420
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	*	4,677	1,797
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	*	1,105	938
3. Copper wire and cable covered and insulated[3]	*	3,486	1,626
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	*	2,032	1,504

* Information not readily available from Company Records.

---

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

Note: For cable assemblies where the neutral conductor is bare and the power conductors are insulated the single conductor footage for the bare neutral was included under B-1 or B-2 and the footage for the insulated conductors was included under B-3 or B-4.

Line contained in our form and therefore not inserted by company to note any delineation of its note. Ellery R. Fosdick.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Charles E. Elbert,
Secretary
November 3, 1960

[fol. 6025] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Long Island Lighting Company
250 Old Country Road, Mineola, New York

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	*	219	7
2. Aluminum & Aluminum Alloy	*	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	*	507	448
2. Aluminum & Aluminum Alloy	*	464	7

* Information not readily available from Company Records.

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Charles E. Elbert,
Secretary
November 3, 1960

[fol. 6026] United States Department of Justice

Schedule III

Long Island Lighting Company
250 Old Country Road
Mineola, New York

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

The proportion of aluminum to copper usage is expected to remain the same in 1960. Commencing in 1961 the proportion of aluminum to copper usage is expected to increase because of the adoption of aluminum for use as a primary conductor on lines operated at 13 KV.

A further slight increase in aluminum usage is expected for future years if experience permits an enlargement of the area now zoned for aluminum use. The predicted use of aluminum as stated herein assumes the continuance of a price differential in its favor comparable to that which now exists.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

The use of aluminum is restricted to a zoned inland area (approximately 80% of the service territory) because of severe corrosion along the shore caused by salt fog and sand blast on the unprotected conductors and connectors. The boundaries in the aluminum zone were conservatively selected so that with favorable operating experience they could be extended to include a larger area.

The unavailability in the past of suitable aluminum connectors for hot stick operation at 13 KV delayed the application of aluminum as a 13KV primary conductor. Recent improvements in connectors now make this application acceptable.

Charles E. Elbert,
Secretary
November 3, 1960

[fol. 6027] United States Department of Justice

Schedule IV

Long Island Lighting Company
250 Old Country Road
Mineola, New York

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

The use of aluminum for underground cables is expected to be discontinued in 1960 and future years. It is not planned to utilize aluminum for underground cables because test installations indicated this type of cable to be unsatisfactory for our use.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Aluminum underground cable was used only for direct buried street lighting. Experience caused us to change over to copper cable for this use because of difficulty with splicing, connections and extent of conductor damage when faults occurred.

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Consolidated Edison Company of New York, Inc.
4 Irving Place, New York 3, N. Y.

Type of Underground Cable	Answer in Thousands of Feet[2] 1950 Estimated	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	67	795
2. Aluminum & Aluminum Alloy	0	0	0
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	11,731	12,294	15,349
2. Aluminum & Aluminum Alloy	0	0	59

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

C. T. Hatcher
Division Engineer
October 31, 1960

[fol. 6031] United States Department of Justice

Schedule III

Consolidated Edison Company of New York, Inc.
4 Irving Place, New York 3, N. Y.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

There has been an increase in the proportion of aluminum conductor to copper conductor used in the last several years and we expect this trend to continue slightly in 1960 and subsequent years.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Our principal use of aluminum is for service drops. The need for line wire on our distribution system is primarily for replacement, rearrangement and extension of our existing copper system. We do not use aluminum conductors for line wire because of additional difficulties in splicing and dead-ending, particularly under emergency conditions.

C. T. Hatcher
Division Engineer
October 31, 1960

[fol. 6032] United States Department of Justice

Schedule IV

Consolidated Edison Company of New York, Inc.
4 Irving Place, New York 3, N. Y.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

We do not use aluminum conductor at the present time and do not expect any increase in use in 1960 and subsequent years unless there is a significant change in the economic picture.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

It is uneconomical to use aluminum conductors on our system at the present time due to increase in duct and splicing box space requirements and the additional difficulties in making interconnections with our existing copper system..

C. T. Hatcher
Division Engineer
October 31, 1960

[fol. 6033] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Niagara Mohawk Power Corporation
300 Erie Boulevard West, Syracuse 2, N. Y.

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	1,603,000	148,000	443,000
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	435,000	1,225,000	3,046,000
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	3,285,000	667,000	232,000
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	2,795,000	5,379,000	9,805,000
3. Copper wire and cable covered and insulated[3]	16,878,000	6,446,000	2,866,000
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	278,000	10,841,000	12,783,000

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

[fol. 6034] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Niagara Mohawk Power Corporation
300 Erie Boulevard West, Syracuse 2, N. Y.

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	122,000	301,000	312,000
2. Aluminum & Aluminum Alloy	None	None	None
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	912,000	903,000	1,007,000
2. Aluminum & Aluminum Alloy	None	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

[fol. 6035] United States Department of Justice

Schedule III

Niagara Mohawk Power Corporation
300 Erie Boulevard West, Syracuse 2, N. Y.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

(Signature illegible)
Vice President
October 31, 1960

[fol. 6036] United States Department of Justice

Schedule IV

Niagara Mohawk Power Corporation
300 Erie Boulevard West, Syracuse 2, N. Y.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

(Signature illegible)
Vice President

[fol. 6037] Pennsylvania Power & Light Company
Ninth and Hamilton Streets, Allentown, Pa.

June 16, 1961

Mr. Lee Loevinger
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Attention: Mr. W. Wallace Kirkpatrick
First Assistant
Ref: LL:WWK:CLW
60-0-37-256

Dear Sir:

In reference to your telephone request of June 7, 1961, and your letter dated June 9, 1961, attached are the completed Schedules I & II on which we have included the 1959 figures along with the figures previously reported for 1950 & 1955. Please note that on Schedule II—the figure shown for B-1 for 1955 has been changed to 33 from 37—A typographical error was made on the first report. Schedules III & IV remain the same as reported on October 25, 1960, and are therefore not attached.

Also supplementing our letter to Mr. Robert A. Bicks dated December 14, 1960, regarding the estimated amount of wire used for service drops, the estimate for 1959 is as follows:

	Thousands of Feet		
	Copper	Aluminum	Total
Year 1959	1500	7300	8800

This estimated footage is in addition to the 1959 figure given on the attached Schedule I-B. The approximate ratio of copper wire to aluminum wire used for service drops in 1959 is 17% copper and 83% aluminum.

Very truly yours, P. W. Siekman, Vice President, General Services.

Attachs.

[fol. 6038] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Pennsylvania Power & Light Company
9th & Hamilton Streets, Allentown, Pa.

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	50	204	12
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	5	405	71
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)**	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	2,766	1,566	842
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	145	4,688	5,954
3. Copper wire and cable covered and insulated[3]	3,822	4,292	449
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	—	74	17

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

** Service drops are not included since our records do not show kinds of wire used.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is

P. W. Siekman

December 14, 1960

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
U. S. Department of Justice
Washington, D. C.

Attention: Mr. Lellery Fosdick
Ref: RAB:CLW
60-0-37-256

Dear Sir:

This will confirm my telephone conversation of today with Messrs. Samuel Karp and Lellery Fosdick, regarding the estimated amount of wire used for service drops during the years 1950, 1955 and 1958.

	Thousands of Feet		
	Copper	Aluminum	Total
1950	7300	0	7300
1955	3500	5200	8700
1958	1800	7300	9100

These estimates are based on stores issues of the size and type of wire normally used for service drops, and in our opinion are fairly accurate estimates.

In 1950 and prior thereto, nearly all service drops were 100% copper. Sometime after 1950, we started using some aluminum wire for service drops. Gradually its use increased so that in 1958, the approximate ratio was 80% aluminum and 20% copper. We expect this ratio to continue in the future, since our specifications require the use of covered aluminum wire for most new residential construction, and covered copper wire for the heavier type service drops and some connections to old copper distribution lines.

The above estimated footage of wire is in addition to those figures given on Schedule I-B, attached to our letter of November 9, 1960.

Very truly yours, P. W. Siekman, Vice President, General Services.

[fol. 6041] Pennsylvania Power & Light Company
Ninth and Hamilton Streets, Allentown, Pa.

November 9, 1960

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
U. S. Department of Justice
Washington, D. C.

Dear Mr. Bicks:

Attached are the completed schedules I to IV, inclusive, which were returned to us for correction of schedules I & II, on which we inadvertently reported data in feet instead of in thousands of feet.

On October 28, 1960, your Mr. Samuel Karp phoned me and requested information on the following:

1. Our general policy on the use of wire for distribution lines.
2. The reason for the decrease in the use of wire in 1958 as shown on Schedule I.
3. The ratio of copper wire to aluminum wire used for service drops.

On November 2, 1960, I phoned Mr. Karp and gave him the information requested. Attached to Schedule I is a supplemental sheet confirming the information which was passed on to Mr. Karp.

Very truly yours, P. W. Siekman, Vice President, General Services.

Attachs.

[fol. 6042] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Pennsylvania Power & Light Company
Ninth & Hamilton Streets, Allentown, Pennsylvania

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1958*
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	50	204	51
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	5	405	1,209
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)**	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	2,766	1,566	240
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	145	4,688	5,289
3. Copper wire and cable covered and insulated[3]	3,822	4,292	1,170
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	—	74	2

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

* The data for 1959 will not be available for about eight months.

** Service drops are not included since our records do not show kinds of wire used.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

P. W. Siekman
Vice President, General Services
October 25, 1960

[fol. 6043] Explanatory Notes Regarding Schedule I
As Requested by Mr. Karp on 10/28/60

1. *General Policy on Use of Wire for Distribution Lines*

In 1950 and prior thereto, our Company used copper wire for the majority of distribution lines and services constructed. Sometime after 1950, we started to test the use of aluminum wire. Within a few years it had proved worthwhile so that by 1956 the majority of distribution lines constructed were of aluminum. We switched from copper to aluminum because of economic considerations, inasmuch as aluminum wire is substantially cheaper than equivalent copper wire. Some copper wire is still being used, especially for short extensions to existing copper lines where mechanical reasons indicate that matching is desirable.

2. *Reason for the Decrease in the Use of Wire in 1958*

It has been noted that the total wire (copper and aluminum) used for distribution was less in 1958 than in 1955. The reason for the decrease is that less new line construction and fewer line conversions (converting a line to higher capacity) took place in 1958 than in 1955. It has also been noted that we used less covered aluminum wire in 1958 than we did in 1955 (item B-4 on Schedule I). The reason is that during 1955 we had discontinued the use of single conductor covered aluminum wire for overhead primary distribution lines and had substituted bare wire, except in special cases in trees and near other objects where close clearances exist.

3. *Ratio of Copper Wire to Aluminum Wire used for Service Drops*

Our records do not show this information. However, it is estimated that in 1950 nearly all service drops were copper wire. In 1955, approximately 40% were copper and 60% aluminum wire. In 1958, approxi-

mately 20% were copper and 80% aluminum. We expect the 1958 ratio to continue as our specifications require the use of covered aluminum wire for most new residential construction and covered copper wire for the heavier type service drops.

Schedule III

Pennsylvania Power & Light Company
Ninth & Hamilton Streets
Allentown, Pennsylvania

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Transmission Lines

We do not now anticipate any change in the proportion of aluminum to copper which will be used in 1960 or in subsequent years.

Distribution Lines

It is expected that the proportion of aluminum to copper will increase gradually.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No restrictions are placed on the use of aluminum conductors for overhead transmission and distribution lines.

P. W. Siekman
Vice President, General Services
October 25, 1960

[fol. 6046] United States Department of Justice

Schedule IV

Pennsylvania Power & Light Company
Ninth & Hamilton Streets
Allentown, Pennsylvania

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Transmission Cable

We do not now anticipate any change in the proportion of aluminum to copper which will be used in 1960 or in subsequent years.

Distribution Cable

It is not expected that there will be any substantial change in the proportion of aluminum to copper used in 1960 or in subsequent years.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No restrictions are placed on the use of aluminum conductor for underground cables.

P. W. Siekman
Vice President, General Services
October 25, 1960

Schedule I

Gross Additions [1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

West Penn Power Co.
Cabin Hill, Greensburg, Pa.

Type of Overhead Line	Answer in Thousands of Feet [2]		
	1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	1434	18	—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	1323	84	445
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	6641	1110	482
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	4231	2962	4601
3. Copper wire and cable covered and insulated [3]	6863	1885	646
4. Aluminum and aluminum alloy wire and cable covered and insulated [3]	2	3037	3700

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

J. O. Chambers
Vice President-Engineering
October 20, 1960.

[fol. 6048] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

West Penn Power Co.
Cabin Hill, Greensburg, Pa.

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	—	—	—
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	2	—	1
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

J. O. Chambers
Vice President Engineering
October 20, 1960.

[fol. 6049] United States Department of Justice

Schedule III

West Penn Power Co.
Cabin Hill, Greensburg, Pa.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Overhead Conductor Trend

If the present price relationship of copper and aluminum continues, the use of copper will be reduced to about 5% of the total use by 1962.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Limited Use of Aluminum Due to Corrosion

No restriction except for a few isolated areas around coke ovens and gob piles.

J. O. Chambers
Vice President-Engineering
October 20, 1960.

[fol. 6050] United States Department of Justice

Schedule IV

West Penn Power Co.
Cabin Hill, Greensburg, Pa.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Underground Cables Trend

There is no change anticipated to the use of aluminum instead of copper in underground cables at the present time.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Limited Use of Aluminum Due to Corrosion

No plans are made to use aluminum cables because of experience of corrosion in the past.

J. O. Chambers
Vice President-Engineering
October 20, 1960.

[fol. 6057] United States Department of Justice

Schedule III

Duquesne Light Company
435 Sixth Avenue, Pgh. 19, Pa.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

There will be no appreciable change during 1960.

It is expected in 1961 and subsequent years that the proportion of aluminum to copper used in Schedule I (Overhead Lines) will be increased. The expected changes will be made from copper to aluminum on 4160 volt distribution.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We have no restrictions on the use of aluminum conductors for overhead lines.

S. Rosenbach
Electrical Engineer
October 25, 1960

[fol. 6058] United States Department of Justice

Schedule IV

Duquesne Light Company
435 Sixth Avenue, Pgh. 19, Pa.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

We do not expect any increase in the proportion of aluminum to copper used in Schedule II (Underground Cables). We presently use no aluminum in this classification.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We restrict the use of aluminum for underground cables because of space limitations, size of existing ducts, corrosion and soil conditions.

S. Rosenbach
Electrical Engineer

E. G. Queskey
President
November 1, 1960

[fol. 6061] United States Department of Justice

Schedule III

The Narragansett Electric Company
Providence, R. I.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Copper is the preferred material for overhead lines especially in the distribution plant. Use of aluminum is indicated when the cost of that material is more favorable than that of copper, or when the span length between supporting structures is great enough to require conductors having more mechanical strength than copper. We expect that the proportion of aluminum to copper used will be about constant. In 1961, we plan construction of a transmission line paralleling the one built in 1955, and therefore about 230 M. ft. of aluminum alloy wire will be required in that year.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do not install aluminum wire within one mile of salt water. Our experience with such installations has been unsatisfactory as to corrosion deterioration.

E. G. Queskey
President
November 1, 1960

[fol. 6061a] United States Department of Justice

Schedule IV

The Narragansett Electric Company
Providence, R. I.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

We have no aluminum in the underground plant, and do not expect to use any in the foreseeable future. Should a major expansion be required where direct-buried cable is indicated or new duct lines are to be built, then the choice between aluminum and copper would be based on cost of material for equal carrying capacity.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

It is unfeasible to install aluminum cables in our existing duct lines as the size of ducts would unduly limit the carrying capacity and the manholes would not accommodate the joints and bends.

November 21, 1960

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Re: RAB:CLW
60-0-37-256

Dear Mr. Bicks:

This will acknowledge your letter of November 18 referring to ours of October 31, 1960 enclosing completed schedules showing the relative use by Virginia Electric and Power Company of aluminum and copper conductor in new construction and replacement.

With regard to Item 5, Schedule I, B reporting service drops in copper and aluminum combined, would advise that our records do not carry a segregation of service drops as between copper and aluminum but we estimate the proportion to be as follows:

	1950	1955	1959
Copper wire—bare and insulated	45%	35%	4%
Aluminum wire—bare and insulated	55%	65%	96%
	100%	100%	100%

The above estimate is based on the ratio of all copper (bare and insulated) and aluminum (bare and insulated) to the total wire used as conductors in distribution lines in each of the periods indicated. We believe this to be a reasonable basis for estimating the amounts of copper service drops and aluminum service drops used by Virginia Electric and Power Company in the periods mentioned.

Very truly yours,

S. E. Ratcliffe
Treasurer

Re: RAB:CLW
60-0-37-256

Dear Mr. Bicks:

We hand you herewith forms which we have completed showing the relative use by our Company of aluminum and copper conductor for new construction and for replacement.

Should you have any question concerning the information shown on these schedules, will you please let us know.

Very truly yours,

S. E. Ratcliffe
Treasurer

[fol. 6072] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Virginia Electric and Power Company
7th and Franklin Streets, Richmond, Virginia

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955[4]	1959[4]
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	203	30	—0—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	503	2,922	1,276
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	10,914	7,326	570
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	17,475	18,970	14,148
3. Copper wire and cable covered and insulated[3]	5,083	3,095	131
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	521	1,476	2,044
5. Service drops—copper and aluminum—bare and insulated[5]	11,870	11,109	11,959

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

[4] Distribution conductor is for 12-month period ending July 31.

[5] Company's records reflect quantity of services by number of conductors and are not separated between copper and aluminum or between bare and insulated. Total feet estimated on basis of average length of 100 feet per service conductor.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Schedule III

Appalachian Power Company
40 Franklin Road, Roanoke, Va.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

None.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Salt water not a problem for this area. ACSR used mostly because of resistance to acid corrosion.

Douglas Tonge
Chief Statistician
November 1, 1960

[fol. 6079] United States Department of Justice

Schedule IV

Appalachian Power Company
40 Franklin Road, Roanoke, Va.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Yes. Its use is restricted because we are not sure of the long range effect of corrosion of aluminum in contact with moisture where a limited supply of oxygen is available. We are hopeful for an answer to this problem within the next 5 years.

Douglas Tonge
Chief Statistician
November 1, 1960

Chicago 90, Illinois

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	435	433	58
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	680	1,150	722
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The above quantities of copper and aluminum are approximations obtained from summarized data concerning gross additions to utility plant for the years indicated. We believe, however, that the indicated relationships between copper and aluminum are reasonable.

Tom Bohon
Plant Accountant
October 26, 1960

[fol. 6083] United States Department of Justice

Schedule III

Commonwealth Edison Company
Chicago 90, Illinois

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Depending on economic trends, the use of aluminum will probably continue to increase with proportionate decline in the use of copper. The increase in aluminum has been made possible by the improvement and standardization in designs and tools for terminal fittings and connectors. Copper to aluminum overhead conductor use ratio changed from approximately 1:1.44 ratio in 1959 to 1:2 ratio in 1960 and is expected to reach 1:3 ratio in 1961.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Aluminum conductor has been restricted in the past due to corrosion preventative construction requirements, non-standardization of terminal fittings and connectors with necessary application tools. With improved alloying of aluminum to higher strengths, the use of copper as a messenger on service entrance cable neutrals will no longer be necessary.

R. B. Gear
Director of Purchases
October 26, 1960

[fol. 6084] United States Department of Justice

Schedule IV

Commonwealth Edison Company
Chicago 90, Illinois

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Currently no increase is expected in use of aluminum for underground cables. A small amount has been used for experiment but its use is limited to direct burial in subdivisions. Until these experiments prove satisfactory, no additional aluminum use is expected.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Aluminum is restricted in general use on underground lines by the following:

1. Space limitations in existing duct lines;
2. Costs are higher than copper, paper and lead;
3. Thermal expansion and contraction results in short life of lead sheaths in manholes.

R. B. Gear
Director of Purchases

Schedule III

Indiana & Michigan Elec. Co.
2101 Spy Run Ave., Fort Wayne, Ind.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

None.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Salt water not a problem in this area. ACSR used mostly because of resistance to acid corrosion.

Douglas Tonge
Chief Statistician
November 1, 1960

[fol. 6092] United States Department of Justice

Schedule IV

Indiana & Michigan Elec. Co.
2101 Spy Run Ave., Fort Wayne, Ind.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Yes. Its use is restricted because we are not sure of the long range effect of corrosion of aluminum in contact with moisture where a limited supply of oxygen is available. We are hopeful for an answer to this problem within the next 5 years.

Schedule III

Public Service Company of Indiana, Inc.
1000 East Main Street, Plainfield, Indiana

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Schedule I—A. Tranmission Lines

No significant change contemplated in 1960 or the next five (5) years.

Schedule I—B. Distribution Lines

It is expected that in 1960 there will be an increase in the ratio of Aluminum to Copper in both bare and covered wires. This trend will continue as long as the cost of aluminum, aluminum alloys and ACSR is less per pound than copper.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No such restrictions or limitations.

Edwin W. Gue
Vice President—Engineering

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Restricted by size of existing ducts.

O. E. Eckert
General Manager

May 3, 1961

Miss Edna Lingreen, Attorney
Antitrust Division
United States Department of Justice
Washington, D.C.

Dear Miss Lingreen:

This will confirm our conversation on May 3.

In accordance with your suggestion and in response to the subpoena which was delivered to me, I am enclosing schedules I and II showing our gross additions to overhead and underground conductors of the type on which you requested information.

I understand that by sending these schedules, it will not now be necessary for me to appear in the Federal Building in Detroit on Tuesday, May 9, 1961, and that you will confirm this to me in writing.

Very truly yours,

C. F. Ogden

[fol. 6112] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

The Detroit Edison Company
2000 Second Avenue, Detroit 26, Michigan

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	782	364	489
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	1,239	2,359	924
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	15	99	32
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	4,451	3,504	5,039
3. Copper wire and cable covered and insulated[3]	31,680	10,556	4,594
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	0	25,929	12,300

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

C. F. Cgden
Vice President

[fol. 6116] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Consumers Power Company
212 West Michigan Avenue, Jackson, Michigan

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	2.2	5.6	—0—
2. Aluminum & Aluminum Alloy	—0—	—0—	—0—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	61.8	52.8	81.1
2. Aluminum & Aluminum Alloy	—0—	—0—	—0—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Harold T. Belcher
Director of Purchases and Stores
October 27, 1960

[fol. 6117] United States Department of Justice

Schedule III

Consumers Power Company
212 West Michigan Avenue
Jackson, Michigan

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Expect proportion of aluminum to increase in future. We now use copper conductor for match-up purposes on multicircuit structures and for replacements. This use will become a smaller percentage in the future as the total line mileage increases. There will be some expansion likely of our present broad use of aluminum for distribution secondaries.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

Harold T. Belcher
Director of Purchases and Stores
October 27, 1960

[fol. 6118] United States Department of Justice

Schedule IV

Consumers Power Company
212 West Michigan Avenue
Jackson, Michigan

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Expect aluminum proportion to increase in future as more buried cable (no duct system) is used on our transmission and distribution systems.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Yes, largely because of sizes of ducts in existing duct runs.

Harold T. Belcher
Director of Purchases and Stores
October 27, 1960

[fol. 6119] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

The Cincinnati Gas & Electric Company & Subsidiaries
Cincinnati, Ohio

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	110.7	12.7	5.4
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	99.0	624.7	154.6
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	1400.7	2157.9	1313.0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	198.0	380.0	618.7
3. Copper wire and cable covered and insulated[3]	8432.5	7651.5	11460.8
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	.0	157.5	233.8

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

[fol. 6121] United States Department of Justice

Schedule III

The Cincinnati Gas & Electric Company & Subsidiaries
Cincinnati, Ohio

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We are using aluminum exclusively for service drops in 1960 so that item B4 will be increased in the amount of 5,000,000 feet and B3 will be reduced by this amount.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We limit the use of aluminum conductor to applications that do not require a large number of tapped connections.

E. S. Fields
President
October 24, 1960

[fol. 6122] United States Department of Justice

Schedule IV

The Cincinnati Gas & Electric Company & Subsidiaries
Cincinnati, Ohio

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do not use underground construction extensively except in high load density areas where duct sizes limit us to the use of copper.

Dear Sir:

Your letter of November 16, 1960 was forwarded to this office. We wish to state that up until the last two (2) years, the Division of Light and Power has been using copper for both underground and overhead circuits. For 1961 we intend to use more aluminum than ever for the overhead circuits. The underground circuits will remain in copper.

We are budgeting for the following aluminum and copper wire quantities for 1961:

Quant.	*Description*
33,000′	#4 ACSR—W.P.—Neo/Poly
25,000′	#2 ACSR—W.P.—Neo/Poly
25,000′	1/0 ACSR—W.P.—Neo/Poly
3,000′	3/0 ACSR—W.P.—Neo/Poly
20,000′	366.4 ACSR Bare
100,000′	#4 Al—Str W.P.—Neo/Poly
50,000′	#4 Al—Str Bare
25,000′	#2—Al—Str W.P.—Neo/Poly
25,000′	#2—Al—Str Bare
50,000′	1/0 Al—Str W.P. Neo/Poly
75,000′	#6 Cu, Sol H.D. W.P. Neo/Poly
25,000′	#4 Cu, Sol H.D. W.P. Neo/Poly

[fol. 6124]

Quant.	*Description*
25,000′	#2 Cu, Sol., H.D. W.P. Neo/Poly
5,000′	1/0 Cu, Str. S.D. W.P. Neo/Poly
30,000′	4/0 Cu, Str. S.D. W.P. Neo/Poly
200,000′	Triplex, Poly, Bare Al Neut. #4
50,000′	Triplex, Poly, Bare Al Neut. #2
20,000′	Triplex, Poly, Bare Al Neut. #1/0

Very truly yours,

George C. Paraskeva
Chief Electrical Engr.

Schedule III

The Cleveland Electric Illuminating Company
55 Public Square

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

There are so many factors that must be considered it would be impossible to forecast whether or not any future change would be made in present practice.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

Harold L. Williams
Manager, Trans. & Dist. Engrg. Dept.
October 26, 1960

[fol. 6128] United States Department of Justice

Schedule IV

The Cleveland Electric Illuminating Company
55 Public Square

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

This company does not currently use aluminum conductors for underground installations. There are so many factors that must be considered that it would be impossible to forecast whether or not any future changes in this practice would be made.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

This company does not currently use aluminum conductors for underground installations.

[fol. 6129] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1960, 1955 and 1959

Ohio Edison Company
47 North Main St., Akron 8, Ohio

Type of Overhead Line	Answer in Thousands of Feet[2] 1960	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	176	176	84
Copperweld wire	109	36	19
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	814	2,655	8,709
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	1,791	658	597
Copperweld wire	25,301	4,343	1,471
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	2,848	34,360	14,531
3. Copper wire and cable covered and insulated[3]	13,431	2,540	783
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	—	63	9,545

See Note Below

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

Note: Data with respect to the quantity of conductors of each classification shown above used in connection with maintenance are not readily available from the books and records of the company. To compile such data from such books and records would require a detailed analysis of all stores requisitions for each of the three years and would considerably delay the completion of this questionnaire; also would entail considerable effort and expense. It is estimated that the quantities of the respective subject conductors used in connection with maintenance in each of the years indicated above were of minor significance.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Otto Brunenmeister, Jr.
Vice President
November 18, 1960

[fol. 6130] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Ohio Edison Company
47 North Main St., Akron 8, Ohio

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	1	34	5
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	226	369	234
2. Aluminum & Aluminum Alloy	—	—	—

See Note on Sched. I

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Otto Brunenmeister, Jr.
Vice President
November 18, 1960

[fol. 6131] United States Department of Justice

Schedule III

Ohio Edison Company
47 North Main St., Akron 8, Ohio

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We do not expect any increase or decrease in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines) in 1960 or subsequent years.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do not restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals. We do not use insulated aluminum conductors for secondary overhead lines (600 volts and below) larger than #2 copper equivalent because of the bulk of these larger size insulated aluminum conductors.

Otto Brunenmeister, Jr.
Vice President
November 18, 1960

[fol. 6132] United States Department of Justice

Schedule IV

Ohio Edison Company
47 North Main St., Akron 8, Ohio

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

We do not expect any increase or decrease in 1960 or subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables).

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do restrict the use of aluminum conductors for underground cables because of space limitations, size of existing ducts, connector problems and cost.

Otto Brunenmeister, Jr.
Vice President
November 18, 1960

[fol. 6133] United States Department of Justice

Schedule I

Gross Additions [1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1960, 1955 and 1959

Ohio Power Company

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true. Subject to the limtiations and qualifications as set forth in my letter of November 1, 1960.

Douglas Junge
Chief Statistician
November 1, 1960

[fol. 6135] United States Department of Justice

Schedule III

Ohio Power Company
301 Cleveland Ave., S.W., Canton, Ohio

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

None.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Salt water not a problem for this area. ACSR used mostly because of resistance to acid corrosion.

Douglas Junge
Chief Statistician
November 1, 1960

[fol. 6136] United States Department of Justice

Schedule IV

Ohio Power Company
301 Cleveland Ave., S.W., Canton, Ohio

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Yes. Its use is restricted because we are not sure of the long range effect of corrosion of aluminum in contact with moisture where a limited supply of oxygen is available. We are hopeful for an answer to this problem within the next 5 years.

Douglas Junge
Chief Statistician
November 1, 1960

[fol. 6137] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Wisconsin Electric Power Company
231 W. Michigan Street, Milwaukee 1, Wisconsin

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	223	124	—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	616	951	2,055
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	1,434	4,231	1,810
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	687	1,722	1,661
3. Copper wire and cable covered and insulated[3]	9,857	9,536	4,329
4. Aluminum and aluminum alloy wire and cable covered and insulated[4]	—	6,193	12,265

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Alfred Gruhl
Executive Vice President
October 31, 1960

[fol. 6138] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Wisconsin Electric Power Company
231 W. Michigan Street, Milwaukee 1, Wisconsin

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	193	362	474
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	419	507	247
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Alfred Gruhl
Executive Vice President
October 31, 1960

[fol. 6139] United States Department of Justice

Schedule III

Wisconsin Electric Power Company
231 W. Michigan Street
Milwaukee 1, Wisconsin

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

It is expected that the proportion of aluminum conductor used for overhead lines will continue high in 1960. This will probably also be true for subsequent years unless there are price changes which would again favor copper.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

The use of aluminum conductor is not restricted in this company's area because of salt water or other corrosion problems.

Alfred Gruhl
Executive Vice President
October 31, 1960

[fol. 6140] United States Department of Justice

Schedule IV

Wisconsin Electric Power Company
231 W. Michigan Street
Milwaukee 1, Wisconsin

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

It is not expected that there will be any change in the use of copper for underground conductor in 1960 or in subsequent years unless price differentials change substantially.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Space limitations in existing ducts and manholes are a definite factor limiting the use of aluminum conductor.

Alfred Gruhl
Executive Vice President
October 31, 1960

December 13, 1960.

Mr. Robert A. Bicks,
Assistant Attorney General,
Antitrust Division,
United States Department of Justice,
Washington, D.C.

Dear Mr. Bicks: Re: RAB:CLW
60-0-37-256

At your request, we have prepared revised Schedule I to show estimated feet in place of pounds of wire in the various categories of distribution lines. It is enclosed herewith together with Schedules II to IV, inclusive, which we have re-executed under current date on forms supplied by you with your letter of December 6, 1960.

Very truly yours,

Balfour S. Jeffry,
President.

[fol. 6156] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for each of the Years 1950, 1955 and 1959[4]

The Kansas Power and Light Company
800 Kansas Avenue, Topeka, Kansas

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare[4]	806	408	8
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	152	1256	604
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)[3]	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare[4]	8951	1306	346
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	212	71	1247
3. Copper wire and cable covered and insulated[5, 4]	2936	1059	281
4. Aluminum and aluminum alloy wire and cable covered and insulated[5]	60	22	371

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

[4] Includes Copperweld.

[5] Estimated (See below)*

[6] Revised Report.

* Because records are kept primarily on the basis of pounds, the indicated figures are estimated on the basis of feet per pound for the type of wire used in each category.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Balfour S. Jeffry
President
December 13, 1960

[fol. 6158] United States Department of Justice

Schedule III

The Kansas Power and Light Company
800 Kansas Avenue
Topeka, Kansas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No, not appreciably. Decisions, however are made on the basis of relative costs and particular job requirements.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

Balfour S. Jeffry
President
December 13, 1960

[fol. 6159] United States Department of Justice

Schedule IV

The Kansas Power and Light Company
800 Kansas Avenue
Topeka, Kansas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Probably not, because of present superior qualities of copper.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Yes, for reasons of corrosion and size.

Balfour S. Jeffry
President
December 13, 1960

[fols. 6160-6161] United States Department of Justice

Schedule I

Gross Additions [1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

The Kansas Power and Light Company
800 Kansas Avenue, Topeka, Kansas
See Attached Sheet

Type of Overhead Line	Answer in Thousands of Feet [2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare [4]			
2. Aluminum and aluminum alloy wire and cable-bare & ACSR [4]

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

The Kansas Power and Light Company
800 Kansas Avenue, Topeka, Kansas

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	—	—	—
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	4	4	5
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Balfour S. Jeffry
President
October 20, 1960

[fol. 6164] United States Department of Justice

Schednle III

The Kansas Power and Light Company
800 Kansas Avenue
Topeka, Kansas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No, not appreciably. Decisions, however are made on the basis of relative costs and particular job requirements.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

Balfour S. Jeffry
President
October 20, 1960

[fol. 6165] United States Department of Justice

Schedule IV

The Kansas Power and Light Company
800 Kansas Avenue
Topeka, Kansas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Probably not, because of present superior qualities of copper.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Yes, for reasons of corrosion and size.

Balfour S. Jeffry
President
October 20, 1960

[fol. 6166] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Lake Region Co-op. Electric Ass'n.
Pelican Rapids, Minnesota

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	—0—	—0—	—0—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	316.8	—0—	—0—
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	—0—	—0—	—0—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	2,275.6	528.0	372.5
3. Copper wire and cable covered and insulated[3]	227	—0—	—0—
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	—0—	37.5	52.5

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Clarence W. Peterson
Manager
October 25, 1960

[fol. 6167] United States Department of Justice

Schedule III

Lake Region Co-op Electrical Ass'n.
Pelican Rapids, Minnesota

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No increase is contemplated primarily because we now use aluminum extensively.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No limitations placed on the use of aluminum. Experience with aluminum conductors has been very favorable, in fact, mechanically it has proven more favorable than copper.

October 31, 1960

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D.C.

Dear Mr. Bicks: Subject: RAB:CLW
60-0-37-256

In response to your request of October 11th, we are attaching data with respect to our use of aluminum and copper conductor for calendar years 1950-1955 and 1959 and answers to the other questions included in the questionnaire attached thereto. This data relates to our Northern States Power Co. (Minn.) operations.

The figures, as to transmission and distribution overhead and underground lines, have been developed from our statistical and property records. Considering the fact that it would not be possible to produce actual quantities of service wire subdivided between copper and aluminum and an actual count of the number of 2 wire versus 3 wire services, for the three years under consideration within the time allotted, we have calculated these quantities based on an estimate as outlined in note (a) on the questionnaire.

We trust that you will find our figures compiled as above indicated entirely satisfactory and acceptable for your purpose.

Very truly yours, A. H. Hamilton, Manager of Purchasing.

AHHamilton:mm

United States Department of Justice
Washington, D. C.

RE: 60-0-37-256

Dear Mr. Bicks:

At the request of Mr. R. B. Harman of the Federal Bureau of Investigation we are attaching four schedules covering information concerning the relative use of aluminum and copper conductor in our company.

In preparing this data it was necessary for us to make some assumptions with respect to minor items such as our service drops and street light standards but in our opinion the assumptions we made would not influence the total picture.

Yours very truly, R. O. Linville.

ROL:mn
attach.

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Kansas City Power & Light Company
1330 Baltimore Avenue, Kansas City, Missouri

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	—	—	43
2. Aluminum & Aluminum Alloy			
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	557	369	338
2. Aluminum & Aluminum Alloy			

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

R. O. Linville
Controller
October 20, 1960

[fol. 6175] United States Department of Justice

Schedule III

Kansas City Power & Light Company
1330 Baltimore Avenue
Kansas City, Missouri

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

The company is using substantially all aluminum conductor for its overhead lines at the present time. We do not contemplate any change in this arrangement.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We have no restrictions concerning the limits for the use of aluminum conductor because of corrosion or other reasons.

R. O. Linville
Controller
October 20, 1960

[fol. 6176] United States Department of Justice

Schedule IV

Kansas City Power & Light Company
1330 Baltimore Avenue
Kansas City, Missouri

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

The company is using copper conductor entirely in its underground system except in a few minor experimental areas. We do not contemplate any change in this program in the near future.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We have no restrictions on the use of aluminum conductor for underground cable except the normal economic restrictions that have existed for some time.

R. O. Linville
Controller
October 20, 1960

[fol. 6177] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Union Electric Company

4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	75	4,384	5,576

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

M. B. Covell
Superintendent of Supply Service
November 10, 1960

[fol. 6178] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Union Electric Company
St. Louis, Missouri

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	XXXXXXXX	XXXXXXXX	XXXXXXXX
1. Copper	16	7	9
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	XXXXXXXX	XXXXXXXX	XXXXXXXX
1. Copper	570	549	570
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

M. B. Covell
Superintendent of Supply Service
November 10, 1960

[fol. 6179] United States Department of Justice

Schedule III

Union Electric Company
St. Louis, Missouri

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We do not anticipate any significant change in the proportion of aluminum to copper to be purchased for use in the classification of Schedule I (Overhead Lines). Our selection of the appropriate metal for several years has been premised on the relative installed economy of the two types of conductors of comparable capacity.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We have no current restrictions or limitations on the use of aluminum conductors for overhead lines because of corrosion. Problems were experienced with connectors in the early years of use several years ago but developments subsequently overcame these difficulties.

M. B. Covell
Superintendent of Supply Service
November 10, 1960

[fol. 6180] United States Department of Justice

Schedule IV

Union Electric Company
St. Louis, Missouri

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No comments. See "B" below.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We have not found it economical to utilize aluminum conductors for underground applications. The relative size of the aluminum conductor of comparable carrying capacity to copper appears to preclude any possible use for underground applications as this element substantially effects the total cost of installed circuits of comparable load carrying capacity.

M. B. Covell
Superintendent of Supply Service
November 10, 1960

[fol. 6181] United States Department of Justice

B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper			
2. Aluminum & Aluminum Alloy		—0—	1

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

James F. Coleman
Manager
October 27, 1960

[fol. 6183] United States Department of Justice

Schedule III

Nodak Rural Electric Cooperative, Inc.
Grand Forks, North Dakota

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

If prices between copper and aluminum remain on the present ratio, we anticipate that future construction on our overhead main multiphase line will consist almost entirely of aluminum ACSR conductor. Most of the anticipated system improvements will be in the larger sizes of conductor (1/0, 2/0, and 3/0). The construction economics are highly favorable toward aluminum in these sizes.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do not incur salt water conditions in this area; however, do find at substation locations serving chemical installations, copper seems more resistant to corrosion.

James F. Coleman
Manager
October 27, 1960

[fol. 6184] United States Department of Justice

Schedule IV

Nodak Rural Electric Cooperative, Inc.
Grand Forks, North Dakota

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Due to the small amount of underground cable used in our operations, our anticipated use would be almost exclusively copper.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Due to the small amount of underground cable used in our operations, our anticipated use would be almost exclusively copper. Copper underground cable preferred on small quantity basis because of space limitations in ducts and greater resistance, due to soil conditions.

Otter Tail Power Company
Fergus Falls, Minnesota

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

We have used no underground cable and do not anticipate future usage at this time.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Your File 60-0-37-256

Dear Sir:

As requested in your letter of October 11, 1960, to Mr. C. W. Smith, we enclose our data as to relative use of aluminum and copper conductor during the years 1950, 1955, and 1959.

Due to the widespread nature of our operations, it is impossible to state, within the time limit imposed on our reply, the footage of conductor actually installed. We have, therefore, shown the amounts received from suppliers during the years shown. The distortion of the relative amounts of aluminum and copper resulting from this substitution should be negligible.

Very truly yours, H. L. Pearson, Assistant Vice President.

HLP:L

cc Mr. A. F. Anderson—Office

[fol. 6189] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Montana-Dakota Utilities Co.
831 Second Avenue South, Minneapolis 2, Minnesota

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	None	None	None
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	217	5082	2636
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	353	181	None
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	None	None	None
3. Copper wire and cable covered and insulated[3]	2440	197	None
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	None	1282	586

[1] Electrical conductor received for new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

H. L. Pearson
Assistant Vice President
October 31, 1960

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Montana-Dakota Utilities Co.
831 Second Avenue South, Minneapolis 2, Minnesota

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	None	None	None
2. Aluminum & Aluminum Alloy	None	None	None
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	None	None	None
2. Aluminum & Aluminum Alloy	None	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Schedule III

Montana-Dakota Utilities Co.
831 Second Avenue South
Minneapolis 2, Minnesota

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No changes foreseen.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No restrictions except in minor isolated instances.

H. L. Pearson
Assistant Vice President
October 31, 1960

[fol. 6192] United States Department of Justice

Schedule IV

Montana-Dakota Utilities Co.
831 Second Avenue South
Minneapolis 2, Minnesota

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No underground system.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

3. Copper wire and cable covered and insulated[3]	1,767	141	34
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	—	1,612	1,508

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Sam. B. Chase
Vice President
October 25, 1960

[fol. 6208] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

The Montana Power Co.
40 East Broadway
Butte, Montana

Type of Underground Cable.	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	—	—	—
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	15	13	29
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Sam. B. Chase
Vice President
October 25, 1960

[fol. 6209] United States Department of Justice

Schedule III

The Montana Power Co.
40 East Broadway
Butte, Montana

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Proportion of Aluminum will probably increase for overhead transmission lines; for distribution lines the proportion will remain about the same.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No such restriction in our service area.

Copper conductor was required in Yellowstone National Park construction in 1959 by government specification.

Sam. B. Chase
Vice President
October 25, 1960

[fol. 6210] United States Department of Justice

Schedule IV

The Montana Power Co.
40 East Broadway
Butte, Montana

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No change contemplated.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Very little underground conductor has been used in our system to date.

Portland 4, Oregon
December 9, 1960

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Attention: Mr. Ellery R. Fosdick

Dear Mr. Bicks:

In reply to the telephone inquiry of your Mr. Fosdick regarding the completed schedules submitted in response to your letter of October 11, 1960, we submit the following additional information.

1. The amounts shown in the schedules were compiled from our Purchasing Department records. However, as our inventories of wire and cable remain very stable from month to month, it is our opinion that the installation of wire and cable is very close to the amount of purchases in any year, and consequently, any difference is nominal.

2. The amount of wire and cable used in maintenance is negligible and therefore would not effect the quantity of wire installed in any year.

3. The general trend in our service area in the use of conductors, in both transmission and distribution, is toward aluminum conductors, except in areas adjacent to the Pacific Ocean which represent a small portion of our system.

Very truly yours,

Albert Bauer
General Manager

AB:ab

[fol. 6212] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Pacific Power & Light Company
Portland, Oregon

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
*A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	39	23	0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	207	2,432	1,633
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	2,473	4,592	1,741
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	220	2,426	2,869
3. Copper wire and cable covered and insulated[3]	10,448	1,822	1,837
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	150	3,419	4,952

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

* Because of the extreme difficulty to completely prepare an accurate statement of the amount of wire installed each year, the amount of wire purchased is used instead.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

D. R. McClung
President
10-24-60

[fol. 6213] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Pacific Power & Light Company
Portland, Oregon

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
*A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	None	None	None
2. Aluminum & Aluminum Alloy	None	None	None
*B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	46	22	56
2. Aluminum & Aluminum Alloy	None	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

* Because of the extreme difficulty to completely prepare an accurate statement of the amount of wire installed each year, the amount of wire purchased is used instead.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

D. R. McClung
President
10-24-60

[fol. 6214] United States Department of Justice

Schedule III

Pacific Power & Light Company
Portland, Oregon

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We do not expect any increase or decrease in the proportion of aluminum to copper in 1960 or subsequent years. However, this will depend upon the proportion of conductor needed for transmission and distribution.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do limit the use of aluminum in a very few areas adjacent to the Pacific Ocean due to corrosion of aluminum by fog and salt contamination.

D. R. McClung
President
10-24-60

[fol. 6215] United States Department of Justice

Schedule IV

Pacific Power & Light Company
Portland, Oregon

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

We do not expect to increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper use in any classification of underground cables.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Use of aluminum conductors for Underground cables is restricted due to space limitations in the size of existing ducts and also due to maintaining splice connections on aluminum underground cables because of cold flow of metals and tight connection problems.

Budget Bureau No. 43-6005, Approval Exp. 12-31-60

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Dear Mr. Bicks:

I am returning the questionnaire your office has asked us to complete regarding the use of aluminum and copper conductor in our operation.

It has been impossible for us to find time to do an accurate recount of the footage for those years; however, we have supplied information based on statistics for the years 1951, 1955, and 1958. The year of 1951 would be quite comparable to 1950, and the year of 1958 would approximate the year 1959.

Even in the figures submitted, the complete accuracy cannot be guaranteed; however, the relative percentages of aluminum versus copper we feel to be very close to the actual ratio.

I certainly hope that our delay in getting this information for you has not been a problem and that the questionnaire will be useful to you.

Very truly yours, Inland Power & Light Co., Vincent P. Slatt, Manager.

[fol. 6217] United States Department of Justice

Schedule J

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Inland Power & Light Co.
E 320-2nd Ave., Spokane 3, Wash.

Type of Overhead Line	Answer in Thousands of Feet[2] 1951	1955	1958
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	None	None	None
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	None	None	None
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	None	None	None
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	404.7	186.3	426.1
3. Copper wire and cable covered and insulated[3]	52.6	53.7	106.6
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	None	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Above are estimates of our work.

Time not sufficient for an accurate footage figure.

V. P. Slatt
Manager

[fol. 6218] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Inland Power & Light Co.
E 330-2nd Ave., Spokane 3, Wash.

Type of Underground Cable	Answer in Thousands of Feet[2]		
	1951	1955	1958
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	None	None	None
2. Aluminum & Aluminum Alloy	None	None	None
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	2.0	2.0	2.0
2. Aluminum & Aluminum Alloy	None	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been estimated and to the best of my knowledge and belief is true.

[fol. 6219] United States Department of Justice

Schedule III

Inland Power & Light Co.
East 320-2nd Ave., Spokane 3, Wash.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No change expected.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No limitations on primary base. However, our utility has standardized on copper service drops. One reason is possible chemical reactions where aluminum enter older transformer secondary bushings and when attached to copper meter loops on residences or poles.

V. P. Slatt
Manager
12-1-60

[fol. 6220] United States Department of Justice

Schedule IV

Inland Power & Light Co.
East 320-2nd Ave., Spokane 3, Wash.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No change.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

October 26, 1960.

Antitrust Division
United States Department of Justice
Washington, D. C.

Attention: Mr. Robert A. Bicks,
Assistant Attorney General

Your Reference: RAB:CLW, 60-0-37-256

Gentlemen:

In accordance with your request dated October 11, 1960, we are submitting the attached questionnaire schedules numbered I, II, III and IV, relating to the use of aluminum and copper as conductor materials by the Department of Lighting of the City of Seattle.

You will note that we were unable to supply all the information required on Schedule I for the years 1950 and 1955; part of the reason for this is that some of our past records do not reflect, in respect to wire and cable use, the schedule's identification of "maintenance" as distinct from "new construction and replacement." We trust that the comments we offer on Schedule III will be sufficient to indicate the trend of our choices in regard to the two metals.

Yours very truly, Paul J. Raver, Superintendent of Lighting.

DP:gn
Attached: Schedules I, II, III, IV

[fol. 6222] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Seattle Department of Lighting
1015 Third Avenue, Seattle 4, Washington

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	0	0	0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	0	123	0
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	No Record	293	200
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	No Record	140	487
3. Copper wire and cable covered and insulated[3]	No Record	No Record	3,600
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	0	0	1,059

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Paul J. Raver
Superintendent of Lighting
October 26, 1960

[fol. 6223] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Seattle Department of Lighting
1015 Third Avenue, Seattle 4, Washington

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	0	0
2. Aluminum & Aluminum Alloy	0	0	0
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	79.513	139.047	219.303
2. Aluminum & Aluminum Alloy	0	0	0

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Paul J. Raver
Superintendent of Lighting
October 26, 1960

[fol. 6224] United States Department of Justice

Schedule III

Seattle Department of Lighting
1015 Third Avenue, Seattle 4, Washington

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

230-KV & 115 KV Transmission: Aluminum (ACSR) will be used exclusively.

26-KV Subtransmission: No change from exclusive use of bare aluminum wire—standard since 1956—is foreseen. Bare copper wire was standard until 1956. *Primary (4-KV) & Secondary Distribution:* Covered and insulated copper wire will continue to be used almost exclusively.

Services: Aluminum Triplex wire was adopted as standard in 1956 for residential and other small services. No change is contemplated.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Transmission & Subtransmission Lines: No restriction of aluminum conductor use on account of corrosion. Aluminum preferred on basis of economic considerations, including cost of conductor and supports for required conductor diameter and current rating. Distribution Lines: Problems associated with the making and changing of many copper-to-aluminum connections on the existing system are the principal limitation on use of aluminum conductor for low-voltage overhead lines.

Paul J. Raver
Superintendent of Lighting
October 26, 1960

[fol. 6225] United States Department of Justice

Schedule IV
Seattle Department of Lighting
1015 Third Avenue, Seattle 4, Washington

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No use of aluminum underground cables is contemplated for 1960 or expected in immediately subsequent years.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Use of aluminum conductor for underground cables has not been adopted for three reasons:

1. Insufficient progress has been made in simplifying splices and terminations of aluminum conductor;
2. Insufficient progress in solving corrosion problems encountered with aluminum underground cables has been achieved; and
3. For a given conduit size, current-carrying capacity of aluminum cables is considerably less than that of copper; in the case of 500-MCM network cables, 330 amperes for aluminum as against 405 amperes for copper.

Paul J. Raver
Superintendent of Lighting
October 26, 1960

[fol. 6226] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Department of Public Utilities
P. O. Box 1639, Tacoma 1, Wash.

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	140	—	—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	—	108	112
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	185	25	152
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	—	341	183
3. Copper wire and cable covered and insulated[3]	995	138	9
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	—	227	674

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

[fol. 6228] United States Department of Justice

Schedule III

Department of Public Utilities
P. O. Box 1639, Tacoma 1, Washington

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No increase indicated on subsequent use of copper and aluminum conductors to date.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor

No restrictions or limitations imposed.

R. M. Boyles
Chief Electrical Engineer
October 21, 1960

[fol. 6229] United States Department of Justice

Schedule IV

Department of Public Utilities.
P. O. Box 1639, Tacoma 1, Washington

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Use of aluminum conductor power cable not anticipated at this time.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Use of aluminum conductors in existing copper underground system would increase inventory of connectors and cable.

Schedule III

The Washington Water Power Company
P. O. Box 1445, Spokane 10, Washington

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No change is expected in the proportion of aluminum to copper indicated by the figures for 1959 in Schedule I.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No restrictions.

C. E. Cannon
Chief Engineer
October 28, 1960

[fol. 6234] United States Department of Justice

Schedule IV

The Washington Water Power Company
P. O. Box 1445, Spokane 10, Washington

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

For years, subsequent to 1960, there may be some increase in the use of aluminum for underground distribution cables.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Size of existing ducts is a factor in determining the economic feasibility of using aluminum underground distribution cables.

[fol. 6237] United States Department of Justice

Schedule III

Cheyenne Light, Fuel and Power Company
108 West 18th Street, Cheyenne, Wyoming

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No change from 1959.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No restrictions.

W. D. Virtue
Vice-President
October 31, 1960

[fol. 6238] United States Department of Justice

Schedule IV

Cheyenne Light, Fuel and Power Company
108 West 18th Street, Cheyenne, Wyoming

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No change.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

It is considered that aluminum cable has not been proven as a satisfactory conductor for underground use.

[fol. 6244] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Arizona Public Service Company
P. O. Box 2591, Phoenix, Arizona

Type of Overhead Line	Answer in Thousands of Feet[2] 1950[4]	1955[4]	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	1,050 M ft	3,000 ft.	0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	0	12,526 M ft	932 M ft
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	4,206 M ft	302 M ft	378 M ft
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	0	6,875 M ft	8,654 M ft
3. Copper wire and cable covered and insulated[3]	2,523 M ft	190 M ft	240 M ft
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	0 M ft	4,120 M ft	5,136 M ft

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

[4] The above figures for 1959 are actual from purchasing records and pole line mile records from FPC reports. The 1950 and 1955 figures are based on FPC reports, pole line mile records and estimates based on kva of load added during those years. Since some of the quantities are estimated there may be a variance with actual Purchase Orders.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

G. H. Foreman
Exec. Vice President
October 27, 1960

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Arizona Public Service Company
P. O. Box 2591, Phoenix, Arizona

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper			
2. Aluminum & Aluminum Alloy			
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	29 M ft	100 M ft	57 M ft
2. Aluminum & Aluminum Alloy			

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

G. H. Foreman

[fol. 6246] United States Department of Justice

Schedule III

Arizona Public Service Company
P. O. Box 2591, Phoenix, Arizona

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

G. H. Foreman
Exec. Vice President
October 10, 1960

[fol. 6247] United States Department of Justice

Schedule IV

Arizona Public Service Company
P. O. Box 2591, Phoenix, Arizona

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No. However we will investigate use of aluminum underground cable and results of these studies may indicate that aluminum may become economical for underground use.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Do not use.

G. H. Foreman
Exec. Vice President
October 27, 1960

[fol. 6250] United States Department of Justice

Schedule III

Salt River Project Agricultural Improvement
and Power District
P. O. Box 1980, Phoenix, Arizona

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

1960-61 uses will be aluminum except for minor re-use of copper conductor presently existing in warehouse stock.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No. Arizona has no problems with salt water or chemical corrosion.

G. W. Brandow
Assistant General Manager
October 25, 1960

[fol. 6251] United States Department of Justice

Schedule IV

Salt River Project Agricultural Improvement
and Power District
P. O. Box 1980, Phoenix, Arizona

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Will continue to use copper cable except as stated in Item 'B' below.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We will continue to use copper cable in the 5 and 15 KV class due to size and economics. We may start using aluminum cable of the 600 volt class for distribution secondaries and services in residential subdivisions.

1. Copper	1,349	1,363	1,595
2. Aluminum & Aluminum Alloy	—	—	16

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Ivan L. Bateman
Chief Electrical Engineer
and Assistant Manager
October 31, 1960

[fol. 6258] United States Department of Justice

Schedule III

Department of Water and Power, City of Los Angeles
Box 3669 Terminal Annex, Los Angeles 54, California

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I

(overhead lines). If so, describe the changes indicating when they will occur.

The Department expects the use of copper for overhead distribution lines to stabilize at the present amount or at a slightly smaller amount. The use of aluminum should increase but at a lesser rate than the 1955-59 usage indicates.

The copper conductor for overhead transmission lines shown in 1958-59 was used in an area close to the ocean where severe corrosion problems exist. It is believed that in the future the Department of Water and Power will use little, if any, copper conductor in overhead transmission lines, assuming that the present differential in price between copper and aluminum continues.

In general new construction or replacement will be with aluminum, ACSR, or aluminum alloy conductors. Occasionally small quantities of copper may be used in relocating short sections of existing lines which have copper conductors.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

At present the Department uses aluminum for overhead distribution lines only in the San Fernando Valley north of Mulholland Drive. This territory is very dry. Its use is anticipated south of Mulholland Drive but we do not plan on using aluminum in the coastal area because of corrosion due to salt spray being carried inland by on-shore winds.

For overhead transmission lines to be located in close proximity to the ocean, aluminum would not be used due to severe corrosion problems encountered in such areas. In most cases, aluminum would be considered satisfactory if the distance from the ocean is more than two miles. It is not anticipated that the Depart-

ment of Water and Power will construct any overhead transmission lines in close proximity to the ocean in the near future.

Ivan L. Bateman
Chief Electrical Engineer
and Assistant Manager
October 31, 1960

[fol. 6259] United States Department of Justice

Schedule IV

Department of Water and Power, City of Los Angeles
Box 3669 Terminal Annex, Los Angeles 54, California

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Proportion of aluminum to copper usage will decrease to zero in 1960 and later years and will remain so until relative installed costs favor installation of aluminum.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Use of aluminum conductors is restricted to areas which are relatively free of ground water or other factors which may contribute to corrosion.

Mr. Robert A. Bicks
Assistant Attorney General
Anti-Trust Division
U. S. Department of Justice
Washington, D. C.

Re: Your File RAB:CLW, 60-0-37-256

Dear Mr. Bicks:

Attached hereto are the schedules seeking information as to the relative use by electric utilities of aluminum and copper conductor which you forwarded to Mr. N. R. Sutherland with your letter of October 11, 1960. We have completed these schedules to the best of our ability and some comment on the information submitted is in order.

The quantities shown for the years 1950 and 1955 represent gross withdrawals and are not reduced by overdrawn quantities subsequently returned to storerooms for credit. They also include reusable copper conductor salvaged from plant retirements. During the year 1955 substantial quantities of bare and insulated copper wire used for overhead construction were reprocessed for Company use from copper wire salvaged in our own operations.

Due to the introduction of more modern accounting equipment after 1955 we were able to exclude from the totals on the attached schedules for the year 1959 overdrawn quantities subsequently returned to storerooms for credit. However, these totals do include reusable copper conductor salvaged from plant retirements.

Certain sizes of copper and aluminum conductors are used in distribution as well as transmission lines. Quantities of such conductors included for all years have been allocated [fol. 6261] between distribution and transmission on the basis of the best available information.

In obtaining the desired information from our records it was not possible, without referring to each requisition, to determine the quantities used for maintenance purposes and therefore the quantities reported by us on the attached schedules include conductor used for this purpose. However; such quantities are negligible in comparison to the totals.

Very truly yours, Richard H. Peterson.

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Pacific Gas and Electric Company
245 Market Street
San Francisco 6, California

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	.1	—	4.2
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	1,301.1	1,229.8	758.1
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

L. W. Coughlan
Comptroller
November 17, 1960

[fol. 6264] United States Department of Justice

Schedule III

Pacific Gas and Electric Company
245 Market Street
San Francisco 6, California

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No changes expected.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Aluminum conductor is not used for any distribution lines in a narrow coastal zone (averaging approximately ½ mile in width) because of possible corrosion of conductors and connections.

Aluminum conductor is not used for primary distribution circuits (except express sections of large conductor) in a broader coastal zone because of possible connection troubles from corrosion.

Use of aluminum conductor for transmission lines is not restricted because relatively large conductors and few connections minimize risk of corrosion trouble.

John F. Bonner
Vice President in Chg. of Engineering
November 17, 1960

[fol. 6265] United States Department of Justice

Schedule IV

Pacific Gas and Electric Company
245 Market Street
San Francisco 6, California

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No changes expected.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Aluminum conductor is not used for underground cables because savings in first cost of installations are marginal and do not justify risks of corrosion, connector troubles, etc.

John F. Bonner
Vice President in Chg. of Engineering

Attention Robert A. Bicks,
Assistant Attorney General
Antitrust Division

Gentlemen:

RAB:CLW 60-0-37-256

The amount of electrical conductor used by us as shown under each category on the questionnaire as sent us is in feet as you surmized and not in thousands of feet as requested. We have placed the decimal point in the proper place on the copies sent us. The corrected copy is attached. Thank you for calling this to our attention.

In answer to your second question, the total amount of conductor shown under Item B-1, Schedule I is for grounds. We do not use bare copper wire in our system except for voltages of 15,000 volts or higher, and even here the only bare copper we have was installed several years ago. Our present practice calls for the installation of aluminum at these higher voltages where bare wire is required.

We are sorry that the correct answers were not given originally. If further information is desired do not hesitate to contact us.

Very truly yours, T. M. Goodrich, General Manager and Chief Engineer, Municipal Light and Power Department

[fol. 6268] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Pasadena Municipal Light & Power Department
100 North Garfield, Pasadena, California

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	34.846	.113
2. Aluminum & Aluminum Alloy	0	0	0
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	211.467	481.289	323.085
2. Aluminum & Aluminum Alloy	0	0	0

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

T. M. Goodrich
General Manager and Chief Engineer
October 26, 1960

[fol. 6269] United States Department of Justice

Schedule III

Pasadena Municipal Light and Power Department
100 North Garfield, Pasadena, California

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Our policy is to use aluminum conductors for overhead lines except for transformer tops and ground wires. We also use copper for repairing of and small extensions to existing copper lines. The use of copper should show a slight proportional decrease through the coming years as more existing lines are replaced.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do not limit or restrict the use of aluminum conductors for overhead lines.

T. M. Goodrich
General Manager and Chief Engineer
October 26, 1960

[fol. 6270] United States Department of Justice

Schedule IV

Pasadena Municipal Light and Power Department
100 North Garfield, Pasadena, California

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

We do not use aluminum for underground cables and do not contemplate any change in the near future.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We restrict the use of aluminum conductors in underground cable because of space, size of existing ducts, and difficulties in splicing.

[fol. 6272] United States Department of Justice

Schedule I.

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Southern California Edison Company
601 West Fifth Street, Los Angeles, California

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	1,920	30	41
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	1,893	2,039	5,057
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	29,568	9,904	6,610
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	0	19,042	23,112
3. Copper wire and cable covered and insulated[3]	37,380	11,983	4,712
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	0	29,817	25,731

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

W. E. Montgomery
Vice President
January 13, 1961

[fol. 6273] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Southern California Edison Company
601 West Fifth Street, Los Angeles, California

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	0	0
2. Aluminum & Aluminum Alloy	0	0	0
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	1,340	1,656	1,483
2. Aluminum & Aluminum Alloy	0	0	723

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

W. E. Montgomery
Vice President
January 13, 1961

[fol. 6274] United States Department of Justice

Schedule III

Southern California Edison Company
601 West Fifth Street, Los Angeles, California

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We do not presently anticipate any significant increase or decrease in the near future in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines)

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do not restrict or limit the use of aluminum conductors on overhead high voltage transmission lines, including lines in coastal areas. However, distribution lines within one mile of contaminated coastal areas have been constructed of copper conductors.

We also have used copper conductors for all connections to the terminals of line equipment or apparatus, (i.e., transformers, switches, reclosers, etc.). It has been our experience that while some equipment terminals are suitable for aluminum conductors, others have been unsatisfactory. To maintain standard construction practices by our field forces, copper conductor is used for all such connections.

W. E. Montgomery
Vice President
January 13, 1961

[fol. 6275] United States Department of Justice

Schedule IV

Southern California Edison Company
601 West Fifth Street, Los Angeles, California

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Changes are expected to be made only to the extent that the total installed costs of aluminum and copper change. We expect to use aluminum and copper interchangeably on the basis of least costs, giving due recognition to material costs, installation costs, electrical losses, reliability and permanency. Changes from one to the other will not be made on a day to day, or other short time, basis.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Restrictions in the use of aluminum may occur in some instances because of insufficient duct size in existing facilities. The extra cost of increased duct size in new facilities, due to the use of aluminum, is recognized as an added cost to the aluminum conductors.

To date, we have found no other reasons, other than those stated above, to limit the use of aluminum; however, we expect to be guided by operating experience.

Attention: Mr. Karp

Gentlemen:

Your Reference: RAB:CLW, 60-0-37-256

As a result of your letter of December 23, 1960 and our recent telephone conversation, wherein you indicated that the information in the Federal Power Commission reports did not fully serve your purposes and requesting that we furnish information as indicated on the schedules transmitted with your letter relative to our Company's use of certain overhead and underground conductors, I have requested, since the information desired is statistical, the affected departments of our Company to provide the statistical information requested to the extent that such information can be supplied from our Company's books and records.

I inquired of such departments as to the time that they estimated would be required to collect the data, and was advised that such time would be a week or ten days. As soon as it has been collected, I will transmit it to you.

Yours very truly, Rollin E. Woodbury, General Counsel.

Attention: Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division

Dear Mr. Bicks:

Re: Your File RAB:CLW, 60-0-37-256

Your letter of October 11, 1960, addressed to Mr. Horton and bearing the above reference number, has been referred to me for reply.

As indicated in your earlier correspondence with Mr. Marx of our legal department, you were previously advised that our Company has consistently taken the position, in connection with inquiries for information from its files involved in litigation in which it was not a party, to request that such information be obtained where appropriate through subpoena; this position has been predicated upon our Company's desire to be neutral and impartial in connection with any litigation in which it is not a party.

In connection with your most recent request, it appears that certain of the information which you desire is reflected in portions of the public reports which are filed by our Company and other utilities with the Federal Power Commission in Washington, D. C. I am advised that the Federal Power Commission Form 1 for Class A and B electric utilities and licenses includes a statistical report on transmission lines added during the year, being reported in the section dealing with transmission line statistics, and that similar information may be derived from statistics in a somewhat different form which appear in Federal Power Com-

mission Form 12 also filed with the Federal Power Com-
[fol. 6278] mission in Schedule 18-A. Since we are not fully apprised as to your purposes in connection with this inquiry, I am of course not certain that the above-mentioned statistical information will be satisfactory to you, but I am calling it to your attention in the hopes that it may be helpful.

Sincerely yours, Rollin E. Woodbury, General Counsel.

Schedule III

Southeast Colorado Power Association
901 West Third Street
La Junta, Colorado

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We consider that the price of copper makes it too expensive for us to use. About 5 years ago we started eliminating the use of copper in all places possible. We will continue to reduce the use of copper in all places possible, although we are using proportionately about as small an amount of copper as we can.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Aluminum overhead conductor gives us no problems in our area. We find it more economical than copper and very satisfactory.

2. Aluminum and aluminum alloy wire and cable-bare & ACSR	See Note		636
3. Copper wire and cable covered and insulated[3]	See Note		176
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	See Note		670

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

Note—Complete information on distribution lines not available for years 1950 and 1955. No aluminum conductor installed in distribution lines in 1950.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

[fol. 6296] United States Department of Justice

Schedule III

Southern Nevada Power Co.
Las Vegas, Nevada

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No change.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

None.

Harry Allen
Vice President
October 27, 1960

[fol. 6297] United States Department of Justice

Schedule IV

Southern Nevada Power Co.
Las Vegas, Nevada

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No change.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

None.

Antitrust Division
United States Department of Justice
Washington, D. C.

Dear Mr. Bicks:

In accordance with your letter dated October 11, 1960, to Arkansas Power & Light Company we are attaching completed schedules showing the related use of aluminum and copper conductor by this company.

Very truly yours, W. M. Harrell, Treasurer.

WMH/rg,
Attach.

[fol. 6304] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Arkansas Power & Light Company
Pine Bluff, Arkansas
(See Note A)

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	2	None	None
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	1253	847	395
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	16203	3355	5324
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	None	7907	6318
3. Copper wire and cable covered and insulated[3]	1664	1503	633
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	None	None	5669

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

Note A—See letter of transmittal dated November 4, 1960 for basis of compiling data.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

W. M. Harrell
Treasurer
November 4, 1960

[fol. 6305] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Arkansas Power & Light Company
Pine Bluff, Arkansas
(See Note A)

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	None	None	None
2. Aluminum & Aluminum Alloy	None	None	None
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	61	49	15
2. Aluminum & Aluminum Alloy	None	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

Note A—See letter of transmittal dated November 4, 1960 for basis of compiling data.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

W. M. Harrell
Treasurer
November 4, 1960

[fol. 6306] United States Department of Justice

Schedule III

Arkansas Power & Light Company
Pine Bluff, Arkansas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Any proportionate change in the use of aluminum to copper used in any classification of Schedule I (overhead lines) will be determined on price differential at the time of purchase.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No.

W. M. Harrell
Treasurer
November 4, 1960

[fol. 6307] United States Department of Justice

Schedule IV

Arkansas Power & Light Company
Pine Bluff, Arkansas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Any proportionate change in the use of aluminum to copper used in any classification of Schedule II (underground cables) will be determined on price differential at the time of purchase.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

On existing systems restrictions on the use of aluminum cables for replacement purposes would be attributable to space limitations and size of the existing ducts. On proposed extensions or expansions the use of aluminum cables presently would be restricted due to lack of experience with aluminum cables in underground distribution systems. Also, there is presently no economic advantage in the use of aluminum cables in lieu of copper cables.

W. M. Harrell
Treasurer

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Louisiana Power & Light Company
142 Delaronde Street
New Orleans 14, Louisiana

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	1	1	—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	1,230	931	581
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	6,062	2,842	636
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	7,831	9,256	10,027
3. Copper wire and cable covered and insulated[3]	5,068	654	86
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	89	3,262	4,711

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

Note: Wire and cable purchased in feet and pounds. The wire purchased in pounds was converted to feet by using conversion tables from manufacturer's catalogue.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

G. C. Rawls
President
October 27, 1960

[fol. 6313] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Louisiana Power & Light Company
142 Delaronde Street
New Orleans 14, Louisiana

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	—	—	12
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	4	28	1
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

G. C. Rawls
President
October 27, 1960

[fol. 6314] United States Department of Justice

Schedule III

Louisiana Power & Light Company
142 Delaronde Street
New Orleans 14, Louisiana

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No significant change expected in 1960. The Company purchases its transmission and distribution conductor on the basis of its dollars buying the most electrical conductivity. Hence price relationships would determine the conductor purchased.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do not use aluminum conductor within three miles of the Gulf of Mexico.

G. C. Rawls
President
October 27, 1960

[fol. 6315] United States Department of Justice

Schedule IV

Louisiana Power & Light Company
142 Delaronde Street
New Orleans 14, Louisiana

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No significant change expected in 1960. The Company purchases its transmission and distribution conductor on the basis of its dollars buying the most electrical conductivity. Hence price relationships would determine the conductor purchased.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Company does not use aluminum conductor in underground cable installations due to misgivings concerning chemical reactions.

G. C. Rawls
President

Attention: Mr. Robert A. Bicks, Assistant Attorney General
Your Reference: RAB-CLW, 60-0-36-256

Dear Sir:

In accordance with instruction from Mr. Samuel Karp of the Department of Justice, we have converted pounds to feet on our aluminum and copper conductors for the years, 1950, 1955 and 1959, which is in response to your letter dated October 11, 1960 and in further connection with our letter to you October 26, 1960.

The attachments to your schedules show the trends in the use of copper and aluminum conductors in our Company and the method of conversion we have used in arriving at the footage of these conductors.

Yours very truly, H. H. Ferrin, Vice President and Treasurer

[fol. 6321] Oklahoma Gas & Electric Company
321 North Harvey
Oklahoma City 1, Okla.

October 26, 1960.

Antitrust Division
United States Department of Justice
Washington, D. C.

Attention: Mr. Robert A. Bicks, Assistant Attorney General

Your Reference: RAB-CLW, 60-0-36-256

Dear Sir:

This letter is in response to your letter dated October 11, 1960, stating that the Department of Justice is seeking information as to the relative use by electric utilities of aluminum and copper conductor for new construction and for replacement.

With your letter were forms of schedules to be completed showing additions in our system of quantities in thousands of feet of transmission line copper wire and cable-bare and of aluminum and aluminum alloy wire. The schedule also requires an answer in thousands of feet of distribution line electrical conductor (with certain exceptions) in 4 categories in thousands of feet for each of the years 1950, 1955, 1959.

The second page of the schedules requires an estimate as to any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification. This page also calls for a statement as to limitations or restrictions on use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals.

Your letter requires an answer by October 31, 1960, with an affirmation of verity. We have given every serious consideration to responding to your request despite the problems involved in correctly stating the information you seek from us. The information requested is not available in the required detail from our Plant Accounting Records. Conductor accounts are not stated in our accounts in feet. We do not segregate bare and covered conductor in the distribution accounts.

[fol. 6322] To comply with your request with the degree of accuracy which we believe would be necessary to fulfill your requirements for exactitude would take a great deal of time and research into original individual job orders and stores requisitions dating back to 10 years. It would be impossible to comply within the time limit stated by you and it would by impraticable to estimate any period of time within which we could complete the research necessary to respond truthfully within the terms of the affirmation you prescribe.

Yours truly, Oklahoma Gas and Electric Co., By H. H. Ferrin, Vice President and Treasurer.

HHF*pw

[fol. 6327] Trends in the Use of Copper and

Aluminum Conductors

The Past. Prior to about 1926, Oklahoma Gas and Electric Company used copper exclusively for all normal transmission and distribution purposes.

The long term trend since then has been toward aluminum, first on transmission, then on rural lines, then on urban distribution systems, until today this metal is used for all transmission and nearly all overhead distribution purposes. Copper is used for underground and for a few special overhead applications.

The Future. We see nothing, except change in the relative price of the two metals, which would cause our Company to go back to copper on any large scale basis. We have no salt or contaminated atmosphere of consequence in our service area in Oklahoma and Arkansas. More trouble is experienced with connections to aluminum than to copper conductors but not enough to change the relative economics. Both metals are good electrical conductors. Copper is the better conductor on volume (circular mil) basis; aluminum is the better conductor on the basis of equal weight.

If underground systems in residential areas should grow in popularity, there is a strong possibility that our Company would use aluminum extensively, especially for the direct burial portions.

Transmission. Since 1946, all transmission lines have been constructed of acsr (Aluminum Conductor Steel Reinforced), except where old conductor was reused. Between 1926 and 1946 both copper and acsr were used according to price differential and other factors.

Rural Lines. Between the late 1920's and the late 1930's both copper and acsr were used in rural areas. Since then, acsr has been used almost exclusively.

Urban Distribution. Copper was used exclusively until 1947. Since then aluminum, with and without steel reinforcing, has been used almost exclusively for all overhead purposes including primary, secondary and service drops.

Coverings on Conductors. About 1930, our Company ceased the use of coverings on all overhead conductors except for service drops and a few special situations.

[fol. 6328] Method of Conversion from Pounds to Feet

Overhead Lines

A. Transmission

Pounds of copper and pounds of aluminum conductor converted from pounds to feet for each job order on the basis of the size of conductor installed on each order.

B. Distribution

Total pounds of copper and pounds of aluminum conductor installed converted to feet on the basis of an average conversion ratio.

An average conversion ratio was calculated from total pounds for each size of conductor issued from stores during 1959 and resulting footage for each size to obtain an average feet per pound for all issues from stores.

This average was used to convert number of pounds of conductor installed in distribution plant number of feet.

The average for 1959 with changes for known variations was used to convert 1950 and 1955.

Underground Cable

Actual footage of underground cable is shown for the periods reported.

Washington, D. C.

Re: RAB:CLW, 60-0-37-256

Dear Mr. Bicks:

Following out the telephone conversation which I had last month with Mr. Samuel Karp of your staff, I am enclosing herewith our schedules concerning the relative use of aluminum and copper conductor.

We found we could not accomplish our objectives by going on the basis of engineering estimates so we put on a night staff and accomplished your request by analysis of our book records which I believe to be substantially correct.

Yours very truly, Elmer K. Higley, Controller

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Harold Tynan
Manager Electric System
October 25, 1960

[fol. 6336] United States Department of Justice

Schedule III

City Public Service Board
Navarro at Villita Street - San Antonio, Texas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

1. For 1960, there should not be any substantial increase (with no decrease) in the use of Al. or Cu. in this system.

2. A considerable increase in the use of aluminum by this Utility is planned for the years 1961, 1962 and 1963, particularly in *transmission lines,* as indicated below: (Thousands of feet)

1961	1962	1963
10,058.4 ft.	39,093.1 ft.	58,085.2 ft.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

None.

Harold Tynan
Manager Electric System
October 25, 1960

[fol. 6337] United States Department of Justice

Schedule IV

City Public Service Board
Navarro at Villita Street - San Antonio, Texas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No plans at present to change proportions.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

The City Public Service Board's use of aluminum conductor for underground cables is restricted because of cold flow of the conductor in terminating.

Electric Building, Houston 1, Texas

October 27, 1960.

Mr. Robert A. Bicks, Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Your Reference No.: RAB-CLW, 60-0-37-256

Dear Mr. Bicks:

In accordance with the request made in your letter of October 11, 1960 to Mr. T. H. Wharton, we have assembled certain information concerning our use of copper and aluminum conductors. The schedules which accompanied your letter have been completed and are being returned to you herewith.

We wish to point out that the quantities in Schedule I–B are approximate, for the following reason. Our records are kept by groups of sizes rather than by individual specific sizes of conductors; also our records are kept in pounds rather than in feet: Therefore to convert from pounds of conductor of assorted sizes to feet of conductor, we have had to use our best judgment and choose one size for each group which, in our opinion, would represent the weighted average of the group. Pounds of this size were then converted to feet to get the answers in the units which you requested. However we believe that this procedure gives a reasonably accurate final figure in feet.

We trust that the information here supplied will be satisfactory.

Yours very truly,

J. F. Estill, Jr., Vice President.

JFE/bw
encl.

[fol. 6339] United States Department of Justice

[fol. 6340] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Houston Lighting & Power Co.
Electric Building, Houston 1, Texas

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	0	0
2. Aluminum & Aluminum Alloy	0	0	0
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	383	887	936
2. Aluminum & Aluminum Alloy	0	0	0

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

J. F. Estill, Jr.
Vice President
October 27, 1960

[fol. 6341] United States Department of Justice

Schedule III

Houston Lighting & Power Co.
Electric Building
Houston 1, Texas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

The proportion of aluminum and copper used will depend on the relative prices and the relative availability of the two metals. Since we can not predict these factors with any degree of accuracy, we do not feel that we should make statements as to the future use of copper and aluminum relative to each other.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

In very limited areas around certain chemical plants and in a very narrowly defined area adjacent to the gulf coast we restrict the use of aluminum. In these areas copper is used because it gives greater resistance to the corrosive effort ef certain chemicals in the atmosphere and to salt spray.

J. F. Estill, Jr.
Vice President
October 27, 1960

[fol. 6342] United States Department of Justice

Schedule IV

Houston Lighting & Power Co.
Electric Building
Houston 1, Texas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

At present we use copper for underground cables. We expect no change in that practice in 1960.
The use of aluminum in underground cables will continue to be given thought and study, but we do not feel that we can make a prediction as to when, if ever, our present practice will change. However, as aluminum cable could not be used in the present duct system, we do not expect any drastic change in the proportion of copper to aluminum in the next few years.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We do restrict the use of aluminum conductor for underground cable to the extent of using no aluminum; in other words copper is used altogether in this area. The reason for our taking this position is two-fold:

1. We believe that the cost of the duct and cable system is less for copper than for aluminum.
2. In our opinion, a more satisfactory splicing job can be done with copper than with aluminum.

J. F. Estill, Jr.
Vice President

[fol. 6343] Pedernales Lower Colorado River
Electric Cooperative
"Texas Corporations"
P. O. Box 1153
Austin 63, Texas

December 6, 1960

Robert A. Bicks
Assistant Attorney General
Antitrust Division
U. S. Department of Justice
Washington, D. C.

Re: RAB; CLW 60-0-37-256

Dear Mr. Bicks:

Attached please find questionnaires for the Pedernales Electric Cooperative, Inc. and the Lower Colorado River Electric Cooperative, Inc. giving schedules of conductors used for the years 1950, 1955, and 1959. The amount of conductors shown on the attached schedules was arrived at by past purchases for the two above mentioned Cooperative's. The amount shown on these schedules is the amount that was purchased during these years except in the case of the Pedernales Electric Cooperative for the year 1950.

In 1950 the Pedernales Electric Cooperative did not purchase any conductor other than covered copper conductor and cables. This conductor was used for service drops. Therefore, we checked the purchases for 1949, assuming that a portion of this wire was used in 1950.

According to our records, the Pedernales Electric Cooperative constructed 109 miles of line in the year of 1950. This includes all types of lines constructed.

If we can be of further assistance, please call us.

Very truly yours, M. G. Hyltin, General Manager

General Manager
December 6, 1960

[fol. 6346] United States Department of Justice

Schedule III

Lower Colorado River Electric Cooperative, Inc.
Giddings, Texas

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

We do not expect any substantial increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I. We have found that ACSR conductors in most cases are more economical to use than copper or copperweld conductors. This economy is brought about mainly by the light weight of aluminum conductors for any given current carrying capacity. In recent years, we have adopted the practice of using ACSR and or aluminum triplex and quadriplex cables for service wire due to the greater economy of using aluminum.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

We have experienced no problems in this area because of corrosion by salt water and chemicals and for these reasons we expect to continue use of ACSR in constructing lines.

M. G. Hyltin
General Manager

Region: VII Southeastern

State	Name
Alabama	Alabama Power Co.
Florida	Clay Electric Coop. Inc.
Florida	Florida Power and Light Co.
Georgia	Georgia Power Co.
Mississippi	Mississippi Power & Light Co.
Mississippi	Southern Pine Electric Power Assn.
North Carolina	Carolina Power & Light Co.
North Carolina	Duke Power Co.
South Carolina	South Carolina Electric & Gas Co.
South Carolina	South Carolina Public Service Authority
Tennessee	Kingsport Utilities, Inc.
Tennessee	Memphis Light Gas & Water Division

[fol. 6349] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Alabama Power Company
600 N. 18th Street, Birmingham, Alabama

Type of Overhead Line	[2]Answer in Thousands of Feet[2] 1950	1955	1959.
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	139.7	134.0	—
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	1,136.9	1,215.4	6,646.8
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	3,916.56	3,141.27	1,087.23
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	23,158.77	14,465.58	13,247.63
3. Copper wire and cable covered and insulated[3]	9,271.15	8,262.85	5,041.95
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	32.89	3,254.86	12,720.69

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

Note: The quantities reported above are in feet of wire of all sizes installed as phase or neutral conductors in gross additions and replacements to the transmission and distribution systems and consist of both newly acquired and reusable materials.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

R. L. Harris
Vice President–Electric Operations
November 7, 1960

[fol. 6350] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Alabama Power Company
600 N. 18th Street, Birmingham, Alabama

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	—	14.6	—
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	141.02	50.60	32.98
2. Aluminum & Aluminum Alloy	—	.28	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

Note: The quantities reported above are in feet of wire of all sizes installed as phase or neutral conductors in gross additions and replacements to the transmission and distribution systems and consist of both newly acquired and reusable materials.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

R. L. Harris
Vice President–Electric Operations
November 7, 1960

[fol. 6351] United States Department of Justice

Schedule III

Alabama Power Company
600 N. 18th Street, Birmingham, Alabama

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

In all cases, the choice between use of aluminum conductor and copper conductor is influenced to a material extent by economics, i.e. by comparative quoted delivered costs per 1,000 feet of the respective conductors at the time of need. Other factors considered in the choice are (1) the effect of sag comparative characteristics on installed costs; (2) the effect of relative physical size in high voltage transmission; (3) breaking strength required in comparison with relative breaking strength available in equivalent capacity conductors of small sizes of the respective materials; (4) local conditions in areas where installations are to be made; and (5) material of existing conductors where to be paralleled by additional conductors on the same poles.

It is our opinion that proportion of aluminum to copper will tend to continue to increase in all classifications of Schedule I but further changes will be gradual and cannot be timed.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No rigid restriction or limit has been specified for use of either copper or aluminum. In general but not

without exception copper has been and is continuing to be used where exposure to salt spray is moderate to severe. Where aluminum is used in such locations, precautions are observed in order to prevent or minimize corrosive action of the salt spray on aluminum and composite steel and aluminum conductors.

R. L. Harris
Vice President–Electric Operations
November 7, 1960

[fol. 6352] United States Department of Justice

Schedule IV

Alabama Power Company
600 N. 18th Street, Birmingham, Alabama

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Transmission lines have not heretofore been regularly installed underground. Such as have been so installed consist of relatively short lines or short extension lines added at irregular intervals during the last 15 years. No worthwhile opinions or conclusions relative to proportions of aluminum to copper in possible future installations can be drawn from projection of such limited and irregular experience.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Underground distribution installations have been made at four widely separated locations. Installations at three locations were started prior to 1941 using copper

conductor in the cable. Installation at the fourth location was started after 1950 using aluminum conductor in the cable. Those installations originally started with copper have continued to be expanded with copper and the one started with aluminum has continued to be expanded with aluminum:—principal considerations being economics in maintaining minimum stocks of wire sizes, connectors, fittings, etc., and in experience of maintenance personnel with the particular materials.

No rigid restriction or limit has been specified for use of either copper or aluminum which would be determinative for any future underground installation.

R. L. Harris
Vice President–Electric Operations
November 7, 1960

[fol. 6353] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Clay Electric Cooperative, Inc.
Keystone Heights, Florida

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	0	0	0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	500,000′	0	250,000′
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	200,000′	0	0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	7,000,000′	6,000,000′	5,000,000′
3. Copper wire and cable covered and insulated[3]	200,000′	100,000′	0
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	0	250,000′	460,000′

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Clay Electric Cooperative, Inc.
Keystone Heights, Florida

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	0	0
2. Aluminum & Aluminum Alloy	0	0	0
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	0	0
2. Aluminum & Aluminum Alloy	0	0	0

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

C. H. G. Handorfer
Manager
December 12, 1960

[fol. 6355] United States Department of Justice

Schedule III

Clay Electric Cooperative, Inc.
Keystone Heights, Florida

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

None.

Will continue to use only aluminum.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

None.

Not in salt area.

C. H. G. Handorfer
Manager
December 12, 1960

3. Copper wire and cable covered and insulated[3]	18,580	798	847
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	—	16,880	17,943

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

R. L. Poor
Assistant Purchasing Agent
October 24, 1960

[fol. 6358] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Florida Power & Light Company
Miami, Florida

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	0	39
2. Aluminum & Aluminum Alloy	—	—	—
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	150	37	233
2. Aluminum & Aluminum Alloy	—	—	—

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

R. L. Poor
Assistant Purchasing Agent
October 24, 1960

[fol. 6359] United States Department of Justice

Schedule III

Florida Power & Light Company
Miami, Florida

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Expect proportion of aluminum to copper to remain approximately the same since usage of one versus the other is determined by geographic boundries, with rate of growth about the same in both areas. This is based upon the present price comparison.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Use of aluminum conductor for overhead lines is limited to areas where severe corrosion due to salt spray is not anticipated. In general this prohibits the use of aluminum within two miles of the ocean or gulf.

R. L. Poor
Assistant Purchasing Agent
October 24, 1960

[fol. 6360] United States Department of Justice

Schedule IV

Florida Power & Light Company
Miami, Florida

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

Aluminum underground cables not used, except a small amount installed by private developer and later acquired by Florida Power & Light Company.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Do not install aluminum underground cables because of anticipated corrosion problems due to salt water and soil conditions.

R. L. Poor
Assistant Purchasing Agent
October 24, 1960

[fol. 6361] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Georgia Power Company
Atlanta, Georgia

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	637	269	0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	5,359	3,998	798
B. Distribution lines (all wire and cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
conductors used in distribution lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
up to and including service drops	xxxxxxxx	xxxxxxxx	xxxxxxxx
but excluding service entrance cable)	xxxxxxxx	xxxxxxxx	xxxxxxxx

[fol. 6362] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Georgia Power Company
Atlanta, Georgia

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	0	38.8	38.2
2. Aluminum & Aluminum Alloy	0	0	0
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	214.3	123.3	111.7
2. Aluminum & Aluminum Alloy	0	0	0

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

R. E. L. O'Hirley
Asst. to V. Pres. & Gen. Mgr.
October 28, 1960

[fol. 6363] United States Department of Justice

Schedule III

Georgia Power Company
Atlanta, Georgia

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

It is anticipated that the use of bare and covered copper conductor will continue to decrease in 1960. It is estimated that 15% less copper conductor will be used in 1960 than was used in 1959 and that the use of bare and covered ACSR conductor will increase by approximately this amount.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

ACSR is used in all areas except those along the seacoast. We do not use ACSR in these areas due to corrosion by salt water.

R. E. L. O'Hirley
Asst. to V. Pres. & Gen. Mgr.
October 28, 1960

[fol. 6364] United States Department of Justice

Schedule IV

Georgia Power Company
Atlanta, Georgia

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of alumimum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No change expected.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

The size of the existing ducts (4" inside diameter) and size of existing cable manholes make it desirable to install copper conductors to provide the maximum current carrying capacity for the installed cable. Due to existing structures of other utilities in the street it is impractical and in some cases impossible to construct larger cable manholes in existing duct lines or in newly constructed duct lines.

Your File: AB:CLW, 60-0-37-256

Dear Mr. Bicks:

We are not in a position to furnish to you the information as requested in your letter of October 11, 1960, addressed to our President, Mr. L. V. Sutton. We are enclosing information as to "conductor Purchased for the Years 1950, 1955, and 1959".

Our situation was discussed over the telephone with Mr. Samuel Karp and Mr. Fosdick in the Justice Department.

Very truly yours, W. H. Weatherspoon, Vice President and General Counsel.

WHW:c
Enc.

[fol. 6374] United States Department of Justice

Schedule I

Conductor Purchased for Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Carolina Power & Light Company
Raleigh, North Carolina

Type of Overhead Line	Answer in Thousands of Feet [1] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	3.2	0	0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	1,136.8	756.2	2,330.5
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	10,360.0	338.8	524.0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	2,727.6	11,651.2	7,788.5
3. Copper wire and cable covered and insulated [2]	9,290.2	499.1	362.8
4. Aluminum and aluminum alloy wire and cable covered and insulated [2]	0	7,850.3	4,971.6

[1] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[2] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

W. R. Doar
Chief Engineer of Lines
December 20, 1960

[fol. 6375] United States Department of Justice

Schedule II

Cable Purchased for Gross Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Carolina Power & Light Company
Raleigh, North Carolina

Type of Underground Cable	Answer in Thousands of Feet [1] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper			
2. Aluminum & Aluminum Alloy			
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	1.2	0.9	0
2. Aluminum & Aluminum Alloy	0	0	0

[1] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

W. R. Doar
Chief Engineer of Lines
December 20, 1960

[fol. 6376] United States Department of Justice

Schedule III

Carolina Power & Light Company
Raleigh, North Carolina

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

No change expected.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Yes. ACSR & aluminum usage restricted in areas of salty atmosphere or chemical contamination due to their corrosive effects.

W. R. Doar
Chief Engineer of Lines
December 20, 1960

[fol. 6377] United States Department of Justice

Schedule IV

Carolina Power & Light Company
Raleigh, North Carolina

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Do not use aluminum for any underground work at present.

W. R. Doar
Chief Engineer of Lines
December 20, 1960

[fol. 6378] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955, and 1959

Duke Power Company
Charlotte, North Carolina

Type of Overhead Line	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	186	15	158
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	997	2,826	2,684
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	2,900	847	0
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	22,107	26,935	26,179
3. Copper wire and cable covered and insulated[3]	26,465	8,829	1,785
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	0	8,295	11,033

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

O. F. Miller
Executive Vice President
October 26, 1960

[fol. 6379] United States Department of Justice

Schedule II

Gross Additions[1] of Underground Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

Duke Power Company
Charlotte, North Carolina

Type of Underground Cable	Answer in Thousands of Feet[2] 1950	1955	1959
A. Transmission cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	None	None	None
2. Aluminum & Aluminum Alloy	None	None	None
B. Distribution cable	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper	None	None	None
2. Aluminum & Aluminum Alloy	None	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor cable. In cases of multiple conductor cable, include the total of single conductor constituting each cable.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

O. F. Miller
Executive Vice President
October 26, 1960

[fol. 6380] United States Department of Justice

Schedule III

Duke Power Company
Charlotte, North Carolina

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

Not until ratio of copper price per pound to price of aluminum per pound is reduced very materially.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No, these factors are not applicable to our service area.

O. F. Miller
Executive Vice President
October 26, 1960

[fol. 6381] United States Department of Justice

Schedule IV

Duke Power Company
Charlotte, North Carolina

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

——, ——.

[fol. 6382] South Carolina Electric & Gas Company
Post Office Box 390
Columbia, South Carolina

December 7, 1960.

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Dear Mr. Bicks:

In a letter dated October 11 your office requested statements of the use of copper and aluminum wire and cable for electric power line construction during several specified calendar years.

On October 20 we wrote you that the information could not be compiled in the time allowed and that any information this Company supplies will necessarily involve estimates which would render the form of certification inappropriate.

On November 17 your Mr. Karp telephoned to request that we prepare such compilations (including estimates) as could be done without undue hardship and submit them for your examination and possible use.

Accordingly, we enclose a statement showing for the years indicated the estimated feet used in the several categories.

Very truly yours, W. J. Ready.

WJR:lt
Enclosure

[fol. 6383]

Schedule I

"Estimated"

	1950	1955	1959
Overhead Lines			
A. Transmission Lines			
1. Copper Wire and Cable-Bare	145	4	1
2 Aluminum and Aluminum Alloy-Bare	499	743	132
B. Distribution System			
1. Copper Wire and Cable-Bare	4,531	3,978	2,240
2. Aluminum and Aluminum Alloy-Bare	2,517	4,129	4,453
3. Copper Wire and Cable-Covered	3,287	3,456	1,473
4. Aluminum and Aluminum Alloy-Covered	1	309	871

Schedule II

"Estimated"

Underground Lines			
A. Transmission Lines			
1. Copper (Submarine)		4	
B. Distribution Lines			
1. Copper	5	26	16

Note:

1. The above figures are stated in thousands of feet.
2. South Carolina Electric & Gas issues Copper and Aluminum wire in pounds, which necessitated using wire charts to convert from pounds to feet. Consequently we have estimates in the following areas.
   (a) When it was not known whether copper wire was stranded or solid in converting from lbs. to feet the multiplier for solid wire was used.
   (b) In converting aluminum conductor from lbs. to feet in many cases it was not known whether the conductor was 6 or 7 strand. The 6 strand multiplier was used.
3. In some cases it was necessary to estimate the number of feet of wire used for each leg of a service. Past experience indicate that 85 feet per leg should be used.

[fol. 6384] South Carolina Electric & Gas Company
Post Office Box 390
Columbia, South Carolina

October 20, 1960.

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Dear Mr. Bicks:

This is in reply to your letter of October 11, addressed to Mr. S. C. McMeekin, President of this Company, requesting by October 31, 1960 statements of the thousands of feet of copper and aluminum conductor used by this Company during the years 1954, 1955 and 1959. We regret to state that it will be impossible within the time indicated to compile and supply the requested information.

Furthermore, even if substantial additional time were available, it is unlikely that we could prepare the information with sufficient exactitude to permit the type of representation prescribed for the signatory due to the necessity of making estimates for sundry periods and the conversion to feet from the units appearing in the records.

Very truly yours, W. J. Ready.

WJR:lt
CC: Mr. Arthur M. Williams, Jr., Staff Counsel

[fol. 6385] South Carolina Electric & Gas Company
Post Office Box 390
Columbia, South Carolina

December 23, 1960.

Mr. Robert A. Bicks
Assistant Attorney General
Antitrust Division
United States Department of Justice
Washington, D. C.

Attention: Mr. Fosdick

Dear Sirs:

Supplementing our letter of December 7, 1960 and in response to a telephone call from your office on December 16, 1960, I enclose a sheet showing the break down of covered aluminum wire for the years 1955 and 1959 between triplex and quadruplex, and also showing the total wire feet in each case.

The attachment also provides responses to items appearing on Schedules III and IV.

Very truly yours, W. J. Ready.

WJR:lt
Enclosure

[fol. 6386]

Schedule I

	Year	Single Wire	Total Wire Feet
Service Drops			
Alum. Triplex	1955	309	927
Alum. Triplex	1959	788	2,364
Alum. Quadruplex	1959	34	136
Distribution Secondary			
Alum. Triplex	1959	49	147

Schedule III

A. Transmission lines will be constructed entirely of aluminum conductor. Distribution lines will be constructed in almost the same ratio as 1959 aluminum to copper.

B. For distribution construction we use copper in coastal areas and certain industrial areas.

Schedule IV

A. At this time we have no aluminum underground lines. We have no major underground construction program scheduled for the immediate future.

B. At this time our underground system is small and it would not be economically feasible to stock quantities of aluminum underground fittings and tools.

FCA
12-23-60

[fol. 6387] United States Department of Justice

Schedule I

Gross Additions[1] of Overhead Electrical Conductor to Electric Utility Plant for Each of the Years 1950, 1955 and 1959

S. C. Public Service Authority
Moncks Corner, South Carolina

Type of Overhead Line	Answer in Thousands of Feet[2] 1950 (1)	1955 (1)	1959 (1)
A. Transmission Lines	xxxxxxxx	xxxxxxxx	xxxxxxxx
1. Copper wire and cable-bare	26.072	62.076	None
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	None	117.512	27,677.878 (2)
B. Distribution lines (all wire and cable conductors used in distribution lines up to and including service drops but excluding service entrance cable)	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx	xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx
1. Copper wire and cable-bare	(3)	68.3021	111.505
2. Aluminum and aluminum alloy wire and cable-bare & ACSR	(3)	3.728	None
3. Copper wire and cable covered and insulated[3]	(3)	287.129	299.179
4. Aluminum and aluminum alloy wire and cable covered and insulated[3]	(3)	None	None

[1] Electrical conductor installed in new construction and for replacement exclusive of conductor used for maintenance.

[2] In answering for each classification give the total, for all sizes, in thousands of feet of single conductor.

[3] In answering for self-supporting aerial cable, service drop, and other multiple conductor cable, include total feet of single conductor constituting each cable.

Note (1) Figures are for fiscal year ending June 30. This date and quantities are for additions to property ledgers during the year.
(2) This figure includes a major transmission expansion.
(3) No accurate figures available for this year as adjustment to actual physical inventory was made June 30, 1950.

The aforesaid information has been supplied from books and records maintained by this utility in the regular course of business and to the best of my knowledge and belief is true.

R. M. Jefferies
General Manager

November 1, 1960

[fol. 6393] United States Department of Justice

Schedule III

Kingsport Utilities, Inc.
422 Broad St., Kingsport, Tenn.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

None.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Salt water not a problem for this area. ACSR used mostly because of resistance to acid corrosion.

Douglas Tonge
Chief Statistician
November 1, 1960

[fol. 6394] United States Department of Justice

Schedule IV

Kingsport Utilities, Inc.
422 Broad St., Kingsport, Tenn.

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

No.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

Yes. Its use is restricted because we are not sure of long range effect of corrosion of aluminum in contact with moisture where a limited supply of oxygen is available. We are hopeful for an answer to this problem within the next 5 years.

Schedule III

Memphis Light, Gas & Water Division
179 Madison Avenue
Memphis, Tennessee

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule I (overhead lines). If so, describe the changes indicating when they will occur.

In 1960 the proportion of copper and aluminum will be the same as 1959. We expect to use aluminum on all primary lines and on some of the secondary lines. Copper is still used on secondary lines and will be for some time.

B. State whether you restrict or limit the use of aluminum conductor for overhead lines because of corrosion by salt water or chemicals, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

No limitation.

W. R. Moyers, Jr.
Vice President
November 29, 1960

[fol. 6398] United States Department of Justice

Schedule IV

Memphis Light, Gas & Water Division
179 Madison Avenue
Memphis, Tennessee

A. State whether you expect any increase or decrease in 1960 or in subsequent years in the proportion of aluminum to copper used in any classification of Schedule II (underground cables). If so, describe the changes indicating when they will occur.

We expect no change.
Aluminum will not be used in underground work.

B. State whether you restrict or limit the use of aluminum conductor for underground cables because of space limitations, size of existing ducts, corrosion by salt water, soil conditions, or for other reasons. If so, describe the restrictions or limitations and give the reasons therefor.

In existing underground conduits we do not use aluminum because of insufficient space for aluminum cables. In new conduit we do not use aluminum cable because of the expense of the larger conduits required by the aluminum cables.

American Standard Specification for Weather-Resistant Wire and Cable, Neoprene Type

Sponsor Electrical Standards Board

Approved January 15, 1954

American Standards Association
Incorporated

[fol. 6460] American Standard

Registered United States Patent Office

An American Standard implies a consensus of those substantially concerned with its scope and provisions. The consensus principle extends to the initiation of work under the procedure of the Association, to the method of work to be followed, and to the final approval of the standard.

An American Standard is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an American Standard does not in any respect preclude any party who has approved of the standard from manufacturing, selling, or using products, processes, or procedures not conforming to the standard.

An American Standard defines a product, process, or procedure with reference to one or more of the following: nomenclature, composition, construction, dimensions, tolerances, safety, operating characteristics, performance, quality, rating, certification, testing, and the service for which designed.

American Standards are subject to periodic review. They are reaffirmed or revised to meet changing economic conditions and technological progress. Users of American Standards are cautioned to secure the latest editions.

Producers of goods made in conformity with an American Standard are encouraged to state on their own responsibility, in advertising, promotion material, or on tags or labels, that the goods are produced in conformity with particular American Standards. The inclusion in such advertising and promotion media, or on tags or labels, of information concerning the characteristics covered by the standard to define its scope is also encouraged.

[fol. 6461] Foreword

(This Foreword is not a part of the American Standard Specification for Weather-Resistant Wire and Cable, Neoprene Type, C8.34-1954.)

This American Standard is one of a series of standards on insulated wire and cable developed by ASA Sectional Committee, C8. The work of the technical subcommittee, in preparing this standard, extended over a period of three years. It was recognized that after a year or two of experience in production and usage there undoubtedly would be additional suggestions as to changes which should be made; however, it was felt that the specification could only be developed by bringing it into commercial usage by issuing it as an American Standard.

Suggestions for improvement gained in the use of this standard will be welcomed. They should be sent to the American Standards Association, Incorporated, 70 East Forty-fifth Street, New York 17, N. Y.

The organizations which participated in this work and the names of their representatives, as listed at the time this standard was submitted to the Sectional Committee for approval, are as follows:

W. F. DAVIDSON, *Chairman* S. D. HOFFMAN, *Secretary*

Organization Represented	Name of Representative
American Institute of Electrical Engineers	W. F. Davidson
	W. A. Del Mar
	L. C. Peterman
	W. N. Zippler

[fol. 6463] American Standard Specification for Weather-Resistant Wire and Cable, *Neoprene Type* *

1. Scope

1.1 These specifications cover neoprene-type weather-resistant wire and cable, the conductors, the materials used for the neoprene coverings, and the acceptance requirements.

2. Conductors

2.1 Copper Conductors. The copper conductors of finished wire and cable shall be in accordance with the following American Standards, or the latest revisions thereof approved by the American Standards Association, Incorporated, except as modified herein.

American Standard Specifications for Soft or Annealed Copper Wire, C7.1-1953, 2nd ed. (ASTM B 3-53T)
American Standard Specifications for Hard-Drawn Copper Wire, C7.2-1953, 2nd ed. (ASTM B 1-53T)
American Standard Specifications for Medium-Hard-Drawn Copper Wire, C7.3-1953 (ASTM B 2-52)
American Standard Specifications for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft, C7.8-1953, 2nd ed. (ASTM B 8-53)

---

* Note: These specifications are the result of cooperative effort among members of ASA Technical Committee 12, the producer of the neoprene polymer, and the several wire and cable manufacturers who are producers of neoprene weather-resistant wire. These specifications are regarded as tentative, since the work of the Committee and those cooperating with it is continuing with a view toward (1) the further development of test methods and specification requirements that will assure furnishing the most desirable type of neoprene compound from the standpoint of service characteristics, and (2) the development of reasonable and desirable methods for assuring the continuity of covering of the finished weather-resistant wire.

Field and manufacturing experience is expected to provide further guidance as to optimum thickness of covering and the most suitable limits for the physical properties of the conductor after weatherproofing.

2.1.1 For completed copper conductors after covering, minimum tensile or breaking-strength limits shall be 5 percent less, and maximum tensile or breaking-strength limits shall be 5 percent greater than the limits specified in the applicable referenced specifications. The minimum elongation limits for annealed solid wires or annealed wires removed from stranded conductors after covering shall be numerically 5 percentage points less than the minimum elongation required for bare conductors (for example, 30 percent reduced to 25 percent). The minimum elongation limits for hard-drawn and medium-hard-drawn solid wires after covering likewise shall be reduced 0.10 percent in numerical value for sizes No. 4 AWG and smaller, and 0.20 percent for sizes larger than No. 4 AWG. No elongation test shall be required on component wires of stranded hard-drawn and medium-hard-drawn copper conductors after covering.

2.2 Copper-Alloy Conductors. The copper-alloy (bronze) conductors of finished wire shall be of Grade-30 alloy, and shall be in accordance with American Standard Specifications for Hard-Drawn Copper Alloy Wires for Electrical Conductors C7.10-1953, 2nd ed. (ASTM B 105-53), or the latest revision thereof approved by the American Standards Association, Incorporated, except as modified herein.

2.2.1 For completed Grade-30 alloy wires after covering, minimum tensile-strength limits shall be 5 percent less, and minimum elongation limits shall be numerically 0.10 percentage points less than the respective limits specified in the above-referenced bare-wire specifications.

2.2.2 These specifications are not intended to cover solid copper-alloy conductors larger than No. 4 AWG or stranded copper-alloy conductors.

2.3 Copper-Covered Steel Conductors. The copper-covered steel conductors of finished wire shall be either Grade-30 high strength or Grade-40 high strength, as specified by the purchaser, and shall be in accordance with American Standard Specifications for Hard-Drawn Copper Covered Steel Wire, C7.17-1953 (ASTM B 227-52), or the latest revision thereof approved by the American Standards Association, Incorporated.

2.4 Aluminum Conductors. The aluminum conductors of finished wire and cable shall be in accordance with the following specifications, or the latest revisions thereof approved by the American Standards Association, Incorporated, except as modified herein:

[fol. 6464] American Standard Specifications for Hard-Drawn Aluminum Wire for Electrical Purposes, C7.20-1953, 2nd ed. (ASTM B 230-53T)

American Standard Specifications for Concentric-Lay-Stranded Aluminum Conductors, Hard-Drawn, C 7.21-1953, 2nd ed. (ASTM B 231-53)

2.4.1 For completed aluminum conductors after covering, minimum tensile or breaking-strength limits shall be 10 percent less than the limits specified in the applicable referenced bare-conductor specifications. The minimum elongation limits for solid hard-drawn aluminum wires after covering shall be numerically 0.5 percentage points less than the minimum elongation required by the applicable bare-wire specification. No elongation test shall be required on component wires of stranded hard-drawn aluminum conductors after covering.

2.5 ACSR. Prior to covering, aluminum conductors, steel-reinforced, shall be in accordance with American Standard Specifications for Concentric-Lay-Stranded Aluminum Conductors, Steel-Reinforced (ACSR), C7.22-1953, 2nd ed. (ASTM B 232-53T), or the latest revision thereof approved by the American Standards Association, Incorporated.

2.5.1 Tensile or elongation tests shall not normally be required on completed ACSR or its component wires after covering; however, upon advance agreement between manufacturer and purchaser, breaking-strength tests may be made upon completed ACSR with covering removed. For such tests, compression or other suitable fittings shall be employed.

2.5.2 For purposes of rating, the breaking strength of finished ACSR after covering shall be taken as 95 percent of the bare-conductor breaking strength specified in 8(a) of American Standard Specifications for Concentric-Lay-Stranded Aluminum Conductors, Steel-Reinforced (ACSR),

C7.22-1953, 2nd ed. (ASTM B 232-53T). If ACSR is tested in accordance with advance mutual agreement between manufacturer and purchaser, its breaking strength after covering shall be not less than 95 percent of the bare-conductor breaking strength specified in 8(b) of the same specification.

3. Neoprene Covering

The covering shall be neoprene (polychloroprene) so compounded and vulcanized as to meet the following requirements. The compound shall contain suitable amounts of well-dispersed channel black and anti-oxidants to insure long life as a line-wire covering in direct contact with metallic conductors.

3.1 Physical Requirements. The covering shall conform to the following requirements when tested in accordance with American Society for Testing Materials Tentative Methods of Testing Rubber Insulated Wire and Cable (ASTM D 470-52T).

Initial tensile strength, minimum, psi	1400
Initial elongation at rupture, minimum, percent	250
Set in 2-inch gage length, maximum, inch	3/8
Oxygen-pressure aging test (96 hrs at 70C and 300 psi)	
Tensile strength, minimum, percent of original	75
Elongation, minimum, percent of original	65
Oil-Immersion test (18 hrs at 121C)	
Tensile strength, minimum, percent of original	60
Elongation, minimum, percent of original	60

4. Acceptance Requirements

The finished wire or cable shall meet the following acceptance requirements. The frequency of sampling to determine compliance with these requirements shall be in accordance with 5, Samples for Test, and conformance with these requirements shall be in accordance with 9, Acceptance or Rejection.

4.1 Conductor Tests. Tests on conductors of other than ACSR construction shall be made upon finished wire or

cable after removing the covering. Tests and properties shall conform to the requirements of 2, Conductors.

4.2 Thickness of Covering. The average thickness of the covering, considered as one-half the difference between the average over-all diameter measured over the covering, and the diameter of the bare conductor, shall be not less than that shown in Tables 1 or 2. The minimum thickness at any point shall be not more than 5 mils below the specified average for thickness 3/64 inch and under, and not more than 10 percent below the specified average for 4/64 inch and over.

4.3 Weights and Tolerances

4.3.1 The diameters of the conductors of finished wire or the individual strands of stranded conductors in finished cable supplied under these specifications shall meet the requirements and limits of 2, Con-

* Aluminum wires only.

† Area of hard-drawn copper cable (conductivity = 97 percent IACS) having the same d-c resistance as that of the ACSR (aluminum conductivity = 61 percent IACS).

ductors, and the variation in weights from Tables 1 and 2 shall be determined by the dimensional tolerances of 2, Conductors.

4.3.2 The average weight of the covering of wire or cable in any lot or shipment of any one size or type manufactured or supplied under these specifications shall vary not more than 15 percent over or 15 percent under the nominal weights given in Tables 1 and 2. This average applies to the entire lot or shipment and is not cause for rejection of an individual coil or reel exceeding the 15-percent variation. Each sample used for this test shall be not less than 2 feet in length for sizes 4/0 AWG and smaller, and not less than 1 foot in length for 250,000 cm and larger.

4.3.3 The weights of finished wire and cable in Tables 1 and 2 are presented merely as a matter of information for the convenience of the user of these specifications, and are subject to the tolerances resulting from the application of 4.3.1 and 4.3.2.

5. Samples for Test

Samples to determine conformance with Acceptance Requirements, 4, shall be taken as prescribed in the following paragraphs:

5.1 Cutting. Fair samples shall be cut from the ends of coils or reels, after first cutting back these ends at least 2 feet. These samples shall be cut in half and tagged—one-half to be used for the tests, the other half to be held in reserve for check tests. The samples shall not be distorted or sharply bent.

5.2 Number. The number of samples of each size of wire or cable taken for test shall be as follows:

[fol. 6467] *5.2.1 Wire or Cable Supplied in Coils*

(*a*) For coils of standard size exceeding 1000 feet of wire or cable, samples shall be taken from three coils of the first lot of 25 coils or fraction thereof, and samples from one coil of each additional 25 coils or fraction thereof.

(*b*) For small coils of less than 1000 feet of wire or cable, samples shall be taken from three coils of the first lot of 2500 pounds or fraction thereof and samples from one coil of each additional 2500-pound lot or fraction thereof.

(*c*) If less than three coils are submitted, one sample shall be taken from each coil.

5.2.2 Wire or Cable Supplied on Reels

(*a*) For reels of standard size containing 2000 feet or more of wire or cable, samples shall be taken from three of the first lot of 30 reels or fraction thereof, and samples from one of each additional lot of ten reels or fraction thereof.

(*b*) For small reels of less than 2000 feet of wire or cable, samples shall be taken from three reels of the first lot of 6000 pounds or fraction thereof, and samples from one reel of each additional 2000 pound lot or fraction thereof.

(*c*) If less than three reels are submitted, one sample shall be taken from each reel.

6. Identification

6.1 The wire shall be so identified that the manufacturer can be determined readily.

7. Packing and Marking

7.1 Packing and marking shall be in accordance with the purchaser's specification.

8. Inspection

8.1 Inspection and acceptance shall be made at the point of manufacture. The manufacturer shall give the purchaser, or his representative, such access to his works during working hours as is reasonable and necessary to determine the suitability of the material to be supplied and shall furnish the necessary apparatus, labor, and other facilities for making the inspection and acceptance tests herein called for, without cost to the purchaser. Neither inspection, waiving of inspection, nor the purchaser's acceptance shall relieve the manufacturer from obligation to furnish weather-resistant wire in accordance with these specifications.

9. Acceptance or Rejection

9.1 Conformance with these specifications shall be determined as follows:

(*a*) If 20 percent or more of the samples fail to meet these specifications, an entirely new lot of samples shall be selected at random from the shipment and tested. If the second group of samples fails to meet these specifications, as outlined in the preceding sentence, the entire shipment shall be rejected.

(*b*) The 15-percent variation in the average weight of the complete covering shown in 4.3 establishes a manufacturing tolerance. Should any shipment of wire or cable exceed this manufacturing tolerance by weight, but be satisfactory in all other respects, the purchaser may accept the shipment, but he shall not be required to pay for weather-resistant covering in excess of the allowable variation, and he shall receive credit from the manufacturer for such excess over the maximum permissible

weight of covering, at the price charged for the finished wire or cable.

(*c*) In all cases, even if the shipment of wire or cable is accepted, the coils or reels that fail to meet these specifications shall be rejected, except that individual coils or reels shall not be rejected because covering weights exceed the allowable variation, when the average weight of the entire lot is within the allowable variation or when the customer elects to accept an entire lot or shipment in which the average weight exceeds the allowable variation.

American Standard Specifications for Weather-Resistant Wire and Cable, Polyethylene Type

Sponsor Electrical Standards Board

Approved August 13, 1957
American Standards Association
Incorporated

[fol. 6469] American Standard

Registered United States Patent Office

An American Standard implies a consensus of those substantially concerned with its scope and provisions. The consensus principle extends to the initiation of work under the procedure of the Association, to the method of work to be followed, and to the final approval of the standard.

An American Standard is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an American Standard does not in any respect preclude any party who has approved of the standard from manufacturing, selling, or using products, processes, or procedures not conforming to the standard.

An American Standard defines a product, process, or procedure with reference to one or more of the following: nomenclature, composition, construction, dimensions, tolerances, safety, operating characteristics, performance, quality, rating, certification, testing, and the service for which designed.

American Standards are subject to periodic review. They are reaffirmed or revised to meet changing economic conditions and technological progress. Users of American Standards are cautioned to secure the latest editions.

Producers of goods made in conformity with an American Standard are encouraged to state on their own responsibility in advertising, promotion material, or on tags or labels, that the goods are produced in conformity with particular American Standards. The inclusion in such advertising and promotion media, or on tags or labels, of information concerning the characteristics covered by the standard to define its scope is also encouraged.

[fol. 6470] Foreword

(This Foreword is not a part of American Standard Specifications for Weather-Resistant Wire and Cable, Polyethylene Type, C8.35-1957.)

This American Standard is one of a series of standards on insulated wire and cable developed by ASA Sectional Committee C8. The work of technical subcommittee 12, in preparing this standard, extended over a period of many years. This standard is the result of the cooperative effort between the producers of polyethylene and the several wire and cable manufacturers who are producers of polyethylene weather-resistant wire.

The committee is continuing its efforts with a view towards (1) the further development of test methods and specification requirements that will assure furnishing the most desirable type of polyethylene compound from the standpoint of service characteristics, and (2) the development of reasonable and desirable methods for assuring the continuity of covering of the finished weather-resistant wire.

Field and manufacturing experience is expected to provide further guidance as to optimum thicknesses of covering and the most suitable limits for the physical properties of the conductor after covering.

Suggestions for improvement gained in the use of this standard will be welcomed. They should be sent to the American Standards Association, Incorporated, 70 East Forty-fifth Street, New York 17, N. Y.

The organizations which participated in this work and the names of their representatives, as listed at the time this standard was submitted to the Sectional Committee for approval, are as follows:

C. T. Hatcher, Chairman M. A. Pisciotta, Secretary

[fol. 6473] American Standard Specifications for Weather-Resistant Wire and Cable, Polyethylene Type

1. Scope

1.1 These specifications cover polyethylene-type weather-resistant wire and cable, the conductors, the materials used for the polyethylene coverings, and the acceptance requirements.

2. Conductors

2.1 Copper Conductors. The copper conductors of finished wire and cable shall be in accordance with the following American Standards, or the latest revisions thereof approved by the American Standards Association, Incorporated, except as modified herein.

American Standard Specifications for Soft or Annealed Copper Wire, C7.1-1955 (ASTM B 3-54T)

American Standard Specifications for Hard-Drawn Copper Wire, C7.2-1953, R1957 (ASTM B 1-56T)

American Standard Specifications for Medium-Hard-Drawn Copper Wire, C7.3-1953 (ASTM B 2-52)

American Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft, C7.8-1953 (ASTM B 8-53)

2.1.1 For completed copper conductors after covering, minimum tensile or breaking-strength limits shall be 5 percent less, and maximum tensile or breaking-strength limits shall be 5 percent greater than the limits specified in the applicable referenced specifications. The minimum elongation limits for annealed solid wires or annealed wires removed from stranded conductors after covering shall be numerically 5 per cent less than the minimum elongation required for bare conductors (for example, 30 percent reduced to 25 percent). The minimum elongation limits for hard-drawn and medium-hard-drawn solid wires after covering likewise shall be reduced in numerical value 0.10 percent for sizes No. 4 AWG and smaller, and 0.20

percent for sizes larger than No. 4. No elongation test shall be required on component wires of stranded hard-drawn and medium-hard-drawn copper conductors after covering.

2.2 Copper-Alloy Conductors. The copper-alloy (bronze) conductors of finished wire shall be Alloy No. 30 and shall be in accordance with American Standard Specifications for Hard-Drawn Copper Alloy Wires for Electrical Conductors, C7.10-1956 (ASTM B 105-55), or the latest revision thereof approved by the American Standards Association, Incorporated, except as modified herein.

2.2.1 For completed Alloy No. 30 wires after covering, minimum tensile-strength limits shall be numerically 5 percent less, and minimum elongation limits shall be numerically 0.10 percent less, than the respective limits specified in the above-reference bare-wire specification.

2.2.2 These specifications are not intended to cover solid copper-alloy conductors larger than No. 4 AWG or stranded copper-alloy conductors.

2.3 Copper-Covered Steel Conductors. The copper-covered steel conductors of finished wire shall be either Grade-30 high strength, or Grade-40 high strength as specified by the purchaser, and shall be in accordance with American Standard Specifications for Hard-Drawn Copper Covered Steel Wire, C7.17-1953 (ASTM B 227-52), or the latest revision thereof approved by the American Standards Association, Incorporated:

2.4 Aluminum Conductors. The aluminum conductors of finished wire and cable shall be in accordance with the following American Standards, or the latest revisions thereof approved by the American Standards Association, Incorporated, except as modified herein.

American Standard Specifications for Hard-Drawn Aluminum Wire for Electrical Purposes, C7.20-1956 (ASTM B 230-55T).

American Standard Specifications for Concentric-Lay-Stranded Aluminum Conductors, Hard-Drawn and Three-Quarter Hard-Drawn, C7.21-1956 (ASTM B 231-55)

2.4.1 For completed aluminum conductors after covering, minimum tensile or breaking-strength limits shall be 10 percent less than the limits specified in the applicable [fol. 6474] referenced bare-conductor specifications. The minimum elongation limits for solid hard-drawn aluminum wires after covering shall be numerically 0.5 percent less than the minimum elongation required by the applicable bare-wire specification. No elongation test shall be required on component wires of stranded hard-drawn aluminum conductors after covering.

2.5 ACSR. Prior to covering, aluminum conductors, steel-reinforced, shall be in accordance with American Standard Specifications for Concentric-Lay-Stranded Aluminum Conductors, Steel-Reinforced (ACSR), C7.22-1956 (ASTM B 232-55T), or the latest revision thereof approved by the American Standards Association, Incorporated.

2.5.1 Tensile or elongation tests shall not normally be required on completed ACSR or its component wires after covering. However, upon advance agreement between manufacturer and purchaser, breaking-strength tests may be made on completed ACSR with covering removed. For such tests, compression or other suitable fittings shall be employed.

2.5.2 For purposes of rating, the breaking strength of finished ACSR after covering shall be taken as 95 percent of the bare-conductor breaking strength specified in Section 8(a) of American Standard C.722-1956 (ASTM B 232-55T). If ACSR is tested in accordance with advance mutual agreement between manufacturer and purchaser, the breaking strength of ACSR after covering shall be not less than 95 percent of the bare-conductor breaking strength specified in Section 8(b) of that same specification.

3. Polyethylene Covering

The covering shall be extruded polyethylene compound containing only properly dispersed suitable carbon black and heat-stabilizer and meeting the following physical and chemical requirements:

3.1 Carbon Black. The polyethylene compound on the finished wire or cable shall contain 3.0 percent ± 0.5 per-

cent by weight of medium-color channel black having a maximum particle size of 20 millimicrons (mμ). The absorptivity as determined by the method prescribed in Appendix A shall not be less than 24,000 when measured using light of wave-length 560 mμ, except that for an integrating sphere photometer "white light" (color temperature = 2850 K) shall be used.

3.2 Heat Stabilizer. To insure thermal stability during processing, the polyethylene compound shall contain a suitable antioxidant.

3.3 Specific Gravity. The polyethylene compound on the finished wire or cable shall have a specific gravity of 0.91 to 0.94 as determined by ASTM D 792-50, Standard Methods of Test for Specific Gravity of Plastics.

3.4 Flow Rate. The flow rate of the polyethylene compound on the finished wire or cable shall be such that the melt index shall not exceed 2.1 grams per 10 minutes as determined by ASTM D 1238-52T, Tentative Method of Test for Measuring Flow Rates of Thermoplastics by Extrusion Plastometer.

3.5 Tensile Properties. The polyethylene compound removed from the finished wire or cable shall have a tensile strength of not less than 1200 pounds per square inch (psi) and an ultimate elongation at rupture, including cold drawing, of not less than 300 percent when tested in accordance with ASTM D 470-54T, Tentative Methods of Testing Rubber and Thermoplastic Insulated Wire and Cable, except that the gage marks shall be 1 inch apart.

3.6 Weights and Covering Thicknesses. The weights and covering thicknesses shall be those prescribed in Section 4, Acceptance Requirements.

4. Acceptance Requirements

The finished wire or cable shall meet the following acceptance requirements. The frequency of sampling to determine compliance with these requirements shall be in accordance with Section 5, Samples for Test, and conformance with these requirements shall be in accordance with Section 9, Acceptance or Rejection.

4.1 Conductor Tests. Tests on conductors of other than ACSR construction shall be made upon finished wire or cable after removing the covering. Tests and properties shall conform to the requirements of Section 2, Conductors.

4.2 Thickness of Covering. The average thickness of the covering, considered as one-half the difference between the average over-all diameter measured over the covering and the diameter of the bare conductor, shall be not less than that shown in Tables 1 or 2. The minimum thickness at any point shall not be more than 5 mils below the specified average for thicknesses 64ths inch and under, and not more than 10 percent below the specified average for thicknesses greater than 64ths inch.

* Aluminum wires only.

† Area of hard-drawn copper cable [conductivity = 97 percent International Annealed Copper Standard (IACS)] having practically the same d-c resistance as that of the ACSR (aluminum conductivity = 61 percent IACS).

4.3 Weights and Tolerances

4.3.1 The diameters of the conductors of finished wire or the individual strands of stranded conductors in finished cable supplied under these specifications shall meet the requirements and limits of Section 2, Conductors, and the variation in weights from Tables 1 and 2 shall be determined by the dimensional tolerances of Section 2, Conductors.

4.3.2 The average weight of the covering of wire or cable in any lot or shipment of any one size or type manufactured or supplied under these specifications shall be not more than 20 percent over or 10 percent under the nominal weights given in Tables 1 and 2. This average applies to the entire lot or shipment and is not cause for rejection of an individual coil or reel exceeding the allowable variation. Each sample used for this test shall be not less than 2 feet in length for sizes 4/0 AWG and smaller and not less than 1 foot in length for 250,000 circular mils and larger.

4.3.3 The weights of finished wire and cable in Tables 1 and 2 are presented merely as a matter of information for

the convenience of the user of these specifications and are subject to the tolerances resulting from the application of 4.3.1 and 4.3.2.

5. Samples for Test

Samples to determine conformance with Section 4, Acceptance Requirements, shall be taken as prescribed in the following paragraphs:

5.1 Cutting. Fair samples shall be cut from the ends of [fol. 6477] coils or reels, after first cutting back these ends at least 2 feet. These samples shall be cut in half and tagged, one-half to be used for the tests, the other half to be held in reserve for check tests. The samples shall not be distorted or sharply bent.

5.2 Number. The number of samples of each size of wire or cable taken for test shall be as follows:

5.2.1 *Wire or Cable Supplied in Coils*

(1) For coils of standard size exceeding 1000 feet of wire or cable, samples shall be taken from 3 coils of the first lot of 25 coils or fraction thereof, and samples from 1 coil of each additional 25 coils or fraction thereof.

(2) For small coils of less than 1000 feet of wire or cable, samples shall be taken from 3 coils of the first lot of 2500 pounds or fraction thereof, and samples from 1 coil of each additional 2500-pound lot or fraction thereof.

(3) If less than 3 coils are submitted, 1 sample shall be taken from each coil.

5.2.2 *Wire or Cable Supplied on Reels*

(1) For reels of standard size containing 2000 feet or more of wire or cable, samples shall be taken from 3 of the first lot of 30 reels or fraction thereof, and samples from 1 of each additional lot of 10 reels or fraction thereof.

(2) For small reels of less than 2000 feet of wire or cable, samples shall be taken from 3 reels of the first lot 6000 pounds or fraction thereof, and samples from 1 reel of each additional 2000-pound lot or fraction thereof.

(3) If less than 3 reels are submitted, 1 sample shall be taken from each reel.

6. Identification

6.1 The wire shall be so identified that the manufacturer can be determined readily.

7. Packing and Marking

7.1 Packing and marking shall be done in accordance with the purchaser's specification.

8. Inspection

8.1 Inspection and acceptance shall be made at the point of manufacture. The manufacturer shall give the purchaser, or his representative, such access to his works during working hours as is reasonable and necessary to determine the suitability of the material to be supplied and shall furnish the necessary apparatus, labor, and other facilities for making the inspection and acceptance tests herein called for, without cost to the purchaser. Neither inspection, waiving of inspection, nor the purchaser's acceptance shall relieve the manufacturer from obligation to furnish weather-resistant wire in accordance with these specifications.

9. Acceptance or Rejection

9.1 Conformance with these specifications shall be determined as follows:

(1) If 20 percent or more of the samples fail to meet these specifications, an entirely new lot of samples shall be selected at random from the shipment and tested. If the second group of samples fails to meet these specifications as outlined in the preceding sentence, the entire shipment shall be rejected.

(2) The allowable variation in the average weight of the complete covering shown in 4.3 establishes a manufacturing tolerance. Should any shipment of wire or cable exceed this manufacturing tolerance by weight, but be satisfactory in all other respects, the purchaser may accept the shipment but he shall not be required to pay for weather-resistant covering in excess of the allowable variation, and he shall receive credit from the manufacturer for such excess over the maximum permissible

weight of overing at the price charged for the finished wire or cable.

(3) In all cases, even if the shipment of wire or cable is accepted, the coils or reels that fail to meet these specifications shall be rejected, except that individual coils or reels shall not be rejected because covering weights exceed the allowable variation, when the average weight of the entire lot is within the allowable variation, or when the customer elects to accept an entire lot or shipment in which the average weight exceeds the allowable variation.

[fol. 6478] Appendices

(These Appendices are not a part of American Standard Specifications for Weather-Resistant Wire and Cable, Polyethylene Type, C8.35-1957, but are included to facilitate its use.)

Appendix A

Method of Determining Dispersion of Carbon Black in Polyethylene Compounds

A1. Scope

A1.1 This method describes the apparatus and the procedure for determining the degree of dispersion of carbon black in ethylene plastics. The amount of light transmitted through a film of the material under test is measured under specified conditions. From data so obtained the absorptivity of the sample can be calculated when the thickness of the film is known. This absorptivity can be related empirically to degree of dispersion when carbon black concentration and type are also known.

Note: The method of test for determining the carbon black content in ethylene plastics is contained in Appendix B.

A2. Significance

A2.1 The information provided by this method can be used to determine when optimum dispersion of a carbon black has been achieved in ethylene plastics, or for control purposes, to show that a given minimum level of dispersion has been obtained. The degree of dispersion has been

shown to be related to the resistance of black ethylene plastics to degradation on direct exposure to sunlight.

A3. Apparatus

A3.1 The apparatus shall consist of the following:

(1) An integrating sphere spectrophotometer or photometer which conforms to the apparatus requirements of Standard Method of Test for Haze and Luminous Transmittance of Transparent Plastics, ASTM D 1003-52

(2) A specimen holder suitable for the spectrophotometer to be used.

This may be a sheet of rigid material of dimensions dictated by the device into which it is to be inserted, having at its center an opening which does not restrict the light-beam of the spectrophotometer with which it is to be used. Single- or double-surfaced pressure-sensitive tape may be used to hold the test specimen in place over the opening.

Alternately, a pair of standard thickness (0.05 inch) glass or quartz microscope slides held together at their ends by pressure-sensitive tape may be used. A thin film of glycerine (USP or better grade) shall be used to eliminate air interfaces between the specimen and the slides.

(3) Clean forceps for handling test specimens

(4) A die of dimensions suitable for cutting the test specimen

(5) An analytical balance with a precision of ± 0.0001 gram

(6) A set of Class S weights for use with (5)

(7) A suitable ionizing-type static eliminator to facilitate handling the test specimen

(8) A means for determining the density of the sample to ± 1 per cent

(9) As alternative to (5), (6), and (8), a micrometer capable of measuring the thickness of the film with an accuracy of ± 5 percent or better

A4. Test Specimens

A4.1 The test specimen shall be uniform film of such length and width, or diameter, as required by the apparatus with

which its light transmission is to be measured. The thickness of the film shall be such that its transmittance is no less than 0.003 at the wavelength or wavelengths specified for transmission measurement if a spectrophotometer is to be used.

Note: Suitable films may be prepared by pressing out 2-3 milligrams of sample between polished platens of the design shown in Figs. A1 and A2, using temperatures of 140-185 C and a force of 30 tons.

No special preconditioning of test specimens is required, but care must be taken to prevent their injury or contamination. Specimens shall be handled only with clean, smooth forceps.

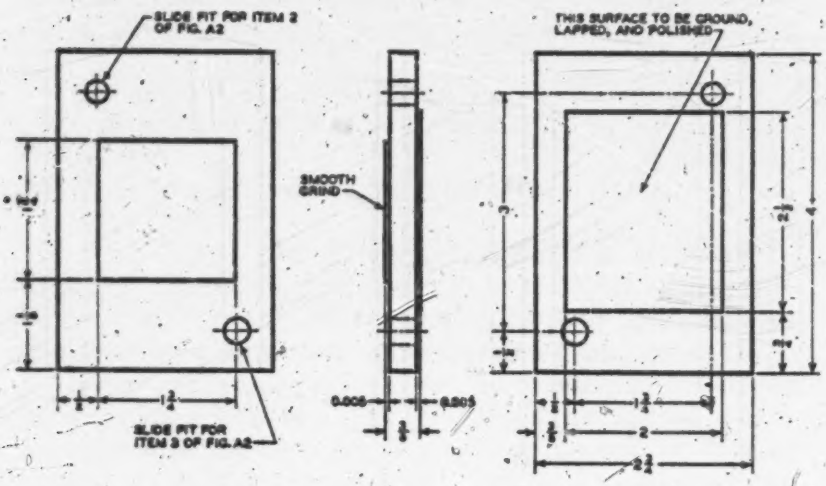
A5. Procedure

A5.1 The average thickness of the test specimen shall be determined from:

(1) Measurement of its weight and density prior to step A5.2, or

(2) Micrometer measurement following step A5.3

[fol. 6479]



Finish: Chromium plate 403A, 0.0002
Material: Kitco Steel, harden to 45 Rockwell "C"
Dimensions expressed in inches.

FIG. A1

A5.2 The specimen shall be mounted in the holder, being handled only with clear forceps. The mounted specimen shall be free of folds or wrinkles.

A5.3 The transmittance of the specimen shall be measured using a procedure approved for the spectrophotometer or integrating sphere photometer being employed and the wavelength or wavelengths called for by the specification covering the material under test. This procedure shall be repeated for three specimens and the results of the three determinations averaged.

Note: Care shall be taken that only the specimen and no portion of the holder or of the pressure-sensitive tape enters the beam of the photometer.

When microscope slides are used to support the test specimen in the holder, a duplicate pair of slides with a film of glycerine between them shall be used as a reference standard.

A5.4 When the thickness of the test specimen is to be measured directly, it shall be determined in accordance with Standard Methods of Test for Thickness of Solid Electrical Insulation, ASTM D 374-42, Method A or C. If glycerine has been used, it shall be removed by careful blotting with clean, lintless, absorbent paper.

A5.5 The absorptivity of the sample, a, shall be calculated as follows:

$$a = \frac{A}{bc} \qquad \text{(Eq A5.5)}$$

where

A = absorbency = $\log \frac{1}{T}$

T = transmittance

b = thickness of the specimen (centimeters)

c = concentration of carbon black (grams/cubic centimeter)

log = $\log_{10}$

Appendix B

Method of Determining Carbon Black Content of Ethylene Plastics

B1. Scope

B1.1 This method describes the apparatus and procedure for determining the carbon black content of ethylene plastics.

B2. Significance

B2.1 The information provided by this method is useful for control purposes and is required for calculation of absorptivity.

B3. Apparatus

B3.1 The apparatus shall consist of the following:

(1) An electric furnace suitable for use with the tubing of (2)

(2) Pyrex or Vicor tubing 1⅛-inch diameter, approximately 4 inches longer than the furnace of (1)

(3) Two rubber or neoprene stoppers to fit tube of (2)

(4) Supplies of 10-millimeter glass tubing and matching rubber or plastic tubing for connections

(5) A combustion boat approximately 3½ inches x ¾ inch x ½ inch. Porcelain or platinum is suitable

(6) A thermometer covering at least the range 300-550 C

(7) A flow meter suitable for measuring gas flow at rates of 1-10 liters per minute.

(8) Three cold traps with removable ground-glass connected heads and 10-mm diameter inner and connecting tubes

(9) A "U"-shaped drying tube, inside diameter 20 mm or larger, fitted with ground glass or neoprene stoppers

(10) A supply of glass wool

(11) A metal desiccator
(12) A Bunsen burner
(13) An analytical balance with a precision of ± 0.0001 gram
(14) A set of Class S weights for use with (13)

B4. Reagents

(1) Purified nitrogen with an oxygen content not greater than 0.01 percent
(2) Pyrogallol, technical grade or better
(3) Potassium hydroxide, technical grade or better
(4) Trichloroethylene, technical grade
(5) Solid carbon dioxide (dry ice)
(6) Anhydrous $CaCl_2$ or other desiccant

B5. Procedure

B5.1 The procedure shall be as follows:

(1) The apparatus shall be set up as shown in Fig. B1. Both cold traps following the combustion tube shall contain trichloroethylene, but only the first need be cooled with dry ice.

(2) A solution of 5 grams pyrogallol and 50 grams potassium hydroxide in 100 milliliters water shall be prepared and enough added to the trap ahead of the drying tube to fill it approximately one-third full.

(3) Anhydrous $CaCl_2$ or other suitable desiccant shall be added to the drying tube and held between loose plugs of glass wool.

(4) A clean combustion boat shall be heated to red heat in a Bunsen flame, then transferred to the metal desiccator and allowed to cool over fresh desiccant for not less than 30 minutes.

(5) The boat shall then be removed from the

[fol. 6482]

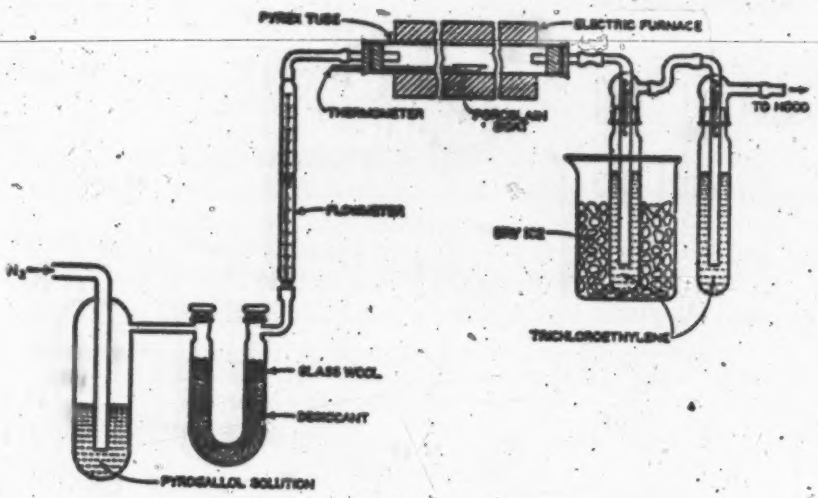

FIG. B1

dessiccator and weighed to nearest 0.0001 gram as quickly as possible.

(6) 1.0 ± 0.1 gram of the ethylene plastic under test shall immediately be placed in the boat and the combination weighed quickly to the nearest 0.0001 gram.

(7) The rate of nitrogen flow shall be adjusted to 1.7 ± 0.3 liters per minute, and the combustion boat with the sample then placed in the Pyrex tube at the center of the furnace with the themometer adjusted so that the bulb is touching the boat. The furnace shall be heated at a rate such that a temperature of 350 C is reached in about 10 minutes, 450 C in another ten minutes, and 500 C after a total of 30 minutes. Heating shall be continued at 500 ± 5 C for an additional 10 minutes.

(8) The tube shall be removed from the furnace with the boat in place and allowed to cool for 5 minutes, the flow of nitrogen being maintained. The boat shall then be removed through the inlet end of the tube and allowed to cool in the desiccator for at least 30 minutes after which the boat and its contents shall be reweighed quickly to the nearest 0.0001 gram.

(9) All determinations shall be made in duplicate. When successive runs are made, the temperature of the

furnace shall be allowed to fall to at least 300 C between determinations.

B6. Calculation

B6.1 The carbon black content shall be calculated as follows:

$$\text{Percent carbon black} = \frac{\text{weight of residue (grams)}}{\text{weight of sample (grams)}} \times 100$$

C = concentration of carbon black (grams/cubic centimeter)

$$= \frac{\text{weight of residue (grams)} \times \text{density of sample}}{\text{weight of sample (grams)}} \qquad \text{(Eq B6.1)}$$

B7. Report

B7.1 The report shall include the following:

(1) Identity of the sample
(2) The individual values calculated as in Section 6
(3) The average of the values in B7.1 (2) above

IPCEA-NEMA Standards Publication

Thermoplastic-insulated Wire and Cable for the Transmission and Distribution of Electrical Energy

This publication includes and supersedes the following Interim Standards which were previously published for inclusion in IPCEA Pub. No. S-61-402, NEMA Pub. No. WC 5:

#1, November 1960 Shielding of Thermoplastic-insulated Cables
#2, September 1959 Polyethylene Insulation for Wires and Cables
#3, September 1959 Thermoplastic Protective Coverings for Lead-sheathed Cables
#4, November 1959 Thermoplastic-insulated Pole and Bracket Cable
#5, November 1959 Black Polyethylene (Thermoplastic) Jacket and Wire Cable
#6, November 1960 Polyvinyl Chloride Insulation, 60 C, for Wires and Cables
#7, November 1960 Polyvinyl - chloride - insulated Cotton-braided Switchboard Wire and Cable

It also supersedes the thermoplastic portion of the IPCEA General Specifications for Wire and Cable with Rubber, Rubber-like and Thermoplastic Insulations, Second Edition, S-19-81.

Approved by Insulated Power Cable Engineers Association
January 12, 1961

Approved as a NEMA Standard May 15, 1961

National Electrical Manufacturers Association

[fol. 6484] **Foreword**

This Standards Publication for Thermoplastic-insulated Wire and Cable for the Transmission and Distribution of Electrical Energy (IPCEA S-61-402; NEMA WC 5-1961) was developed by the Insulated Power Cable Engineers Association and approved by the National Electrical Manufacturers Association.

Suggestions for improvements gained in the use of this standard will be welcomed. They should be sent to the Insulated Power Cable Engineers Association, 283 Valley Road, Montclair, N. J.

Table of Contents—Condensed

	Part	Page
General	1	1
Conductors	2	1-14
Insulation	3	1-6
Shielding and Coverings	4	1-15
Cabling, Fillers, Binders and Circuit Identification	5	1-4
Testing and Test Methods	6	1-20
Constructions of Specific Types	7	1-6
Pole and Bracket Cable	7	1-2
Polyvinyl-chloride-insulated Cotton-braided Switchboard Wire and Cable	7	3
Neutral-supported Secondary and Service Drop Cables	7	5-6
Appendices	8	1-5

For a detailed Table of Contents, see page ii.
For a detailed listing of the appendices, see page v.
For a detailed listing of the tables contained in this publication, see page vi.

[fol. 6485]

Part 1

General

1.1 Scope. These standards apply to materials, constructions and testing of thermoplastic-insulated wires and cables which are used for the transmission and distribution of electrical energy for normal conditions of installation and service, either indoors, aerial, underground or submarine.

The thermoplastic insulations and jackets covered in this publication are compounds made from polyvinyl chloride, or the copolymer of vinyl chloride and vinyl acetate, or polyethylene.

In classifying jackets and sheaths in these standards, the term "jacket" refers to nonmetallic coverings and "sheath" to continuous metallic coverings.

1.2 General Information. These standards cover the requirements for conductors, the various grades of insulations and protective coverings, and general constructional and dimensional details common to most standard types of wires and cables. Constructions of specific types are covered in Part 7. Where a conflict exists between the requirements of Part 7 and those of Parts 1 to 6, inclusive, the requirements of Part 7 shall apply.

1.3 Information to be Supplied by Purchaser.* When requesting proposals from cable manufacturers, the prospective purchaser should furnish the following information:

1.3.1 Characteristics of System on which Cable is to be Used.

(*a*) Current—alternating or direct.

(*b*) Frequency—cycles per second.

(*c*) Normal operating voltage phases or, if direct current, between conductors.

(*d*) Number of phases and conductors. If series lighting, give open-circuit voltage and state whether system is operated with or without protectors.

(*e*) Operated with neutral solidly grounded, grounded

* This paragraph has been approved by NEMA as Authorized Engineering Information.

through resistance or reactance, or ungrounded. If grounded through resistance or reactance state amount.

(*f*) Minimum temperature at which cable will be installed.

(*g*) Description of installation.

(*1*) In buildings.

(*2*) In underground ducts.

(*3*) Aerial.

a. On messenger in metal rings.

b. On messenger with marlin ties.

c. Preassembled.

d. Field spun.

(*4*) Direct burial in ground.

(*5*) Submarine.

(*6*) Descriptions other than the foregoing.

(*h*) Conditions of installations.

(*1*) Ambient temperature.

(*2*) Number of loaded cables in duct bank or conduit. If in conduit, give type of conduit (metallic or nonmetallic), number of loaded conduits, enclosed or exposed, and spacing between conduits.

(*3*) Load factor.

(*4*) Method of bonding and grounding of lead sheaths.

(*5*) Wet or dry location.

1.3.2 Quantities and Description of Cable

(*a*) Total number of feet, including test lengths, and lengths if specific lengths are required.

(*b*) Type of cable. Describe as single conductor, 2-conductor flat, 2-conductor round, etc.

(*c*) Rated circuit voltage, phase to phase.

(*d*) Type of conductor—copper or aluminum.

(*e*) Size of conductors—Awg or circular mils. If conditions require other than standard stranding, a complete description should be given.

(*f*) Type and grade of insulation.

(*g*) Thickness of insulation in 64ths of an inch or in mils.

(*h*) Type of outer covering.

(i) Maximum allowable overall diameter in inches. When duct space is not limited, it is desirable not to restrict the overall diameter.
(j) Method of conductor identification.

[fol. 6486]

Part 2

Conductors

2.1 Material. Conductors shall be annealed uncoated copper, or annealed coated copper, or aluminum.

2.1.1 Copper Conductors. Uncoated conductors shall be of annealed copper wire in accordance with ASTM B 3.

Coated conductors shall be of annealed copper wire in accordance with ASTM B 33 for tin-coated conductors or ASTM B 189 for lead- or lead-alloy-coated conductors.

The continuity of tin coating shall be determined in accordance with ASTM B 33 before the conductors are insulated or stranded.

The continuity of lead and lead-alloy coatings shall be determined in accordance with ASTM B 189 before the conductors are insulated or stranded.

2.1.2 Aluminum Conductors. Solid conductors 8 Awg and smaller shall be "EC" grade aluminum three-quarter hard in accordance with ASTM B 262. Solid conductors larger than 8 Awg and all sizes of stranded conductors shall be "EC" grade aluminum either hard-drawn in accordance with ASTM B 230 or three-quarter hard in accordance with ASTM B 262. Stranded conductors shall conform to ASTM B 231.

2.2 Solid Conductors. Conductors 8 Awg and smaller shall be solid or, when required for a particular application, stranded. Conductors 6 Awg and larger may be solid as indicated in Table 1 when required. Nominal diameters shall be in accordance with Table 1, subject to the tolerances given in 2.5.

2.3 Stranded Conductors

2.3.1 Conductors 6 Awg and larger shall be stranded in accordance with 2.3.3. For series lighting cable conductors 6 and 4 Awg may be solid.

Stranded conductors shall be composed of the number of wires given in Tables 1 through 6 and subject to the tolerances on cross-sectional areas given in 2.5. Intermediate sizes take the stranding of the next larger conductor size given in the tables.

2.3.2 Strand shielding shall be used on stranded conductors of power cables having rated circuit voltages above 2000 volts. This requirement does not apply to series lighting cables.

Strand shielding in thermoplastic-insulated cables is a conducting material at least 0.0025 inch thick applied over the surface of the conductor. It may be conducting nonmetallic tape, conducting compound, or conducting cement.

2.3.3 Uses of Classes of Stranding

2.3.3.1 *Concentric-lay Conductors.* A concentric-lay conductor is a conductor composed of a central core surrounded by one or more layers of helically laid wires.

Class of Stranding *	Use
B	Power cables rated 0–2000 volts for normal use and, where strand shielding is employed (see 2.3.2.), for use above 2000 volts.
C	Power cables where more flexible stranding than Class B is desired.
D	Power cables where extra flexible stranding is desired.

* See Table 1.

See Appendix E for complete titles and dates of ASTM standards to which reference is made in this publication.

[fol. 6487] 2.3.3.2 *Rope-lay Conductors.* A rope-lay conductor is a conductor composed of concentric-lay stranded members or bunch-stranded members.

Classes G and H shall have concentric-lay-stranded members, and Classes I, K and M shall have bunch-stranded members.

Class of Stranding	Use
G (see Table 2)	All cables for portable use.
H (see Table 3)	All cables where extreme flexibility is required, such as for use on take-up sheaves, etc.
I (see Table 4)	Apparatus cable and motor-leads.
K (see Table 5)	Cords and cables composed of No. 30 Awg copper wires.
M (see Table 6)	Cords and cables composed of No. 34 Awg copper wires.

Other strandings are given in Part 7.

2.3.4 The individual wires used in the construction of the stranded conductor shall, before stranding, meet the requirements of 2.1.

2.3.5 The lay of concentric stranded conductors shall be in accordance with ASTM B 8 for copper conductors and ASTM B 231 for aluminum conductors (see Appendix E). The lay of a layer of wires shall be not less than eight nor more than sixteen times the outside diameter of that layer, except that for conductors composed of 37 wires or more, this requirement shall apply only to the two outer layers.

The direction of lay of the outer layer shall be left-hand.

The direction of lay for conductors having a nominal cross-sectional area larger than 8 Awg shall be reversed in successive layers.

2.4 Individual Wire Splices in Solid and Stranded Conductors. A splice in a solid conductor in one of the individual wires of a stranded conductor shall be made in a workmanlike manner and shall be such that the joint will not increase the diameter of the individual wire or of the conductor nor lessen its mechanical strength. A joint or splice in a stranded conductor as a whole shall be made by separately joining each individual wire in such a manner that the overall diameter of the entire stranded conductor will not be increased. In rope-stranded conductors, the primary groups used in forming the rope shall be considered the equivalent of a solid wire in a concentric stranded conductor.

2.5 Tolerances in Diameters and Cross-sectional Areas. The following tolerances apply to determinations made on conductors of the completed cable.

	Diameter, Inches	Maximum Variation in Diameter
Solid copper conductors		
Coated	0.010 and larger	−1%, +3%
	Smaller than 0.010	−0.1 mil, +0.3 mil
Uncoated	0.010 and larger	−1%, +1%
	Smaller than 0.010	−0.1 mi., +0.1 mil
Solid aluminum conductors	0.100 and larger	−1%, +1%
	0.036 up to 0.100	−1 mil, +1 mil
	Smaller than 0.036	−0.5 mil, +0.5 mil

[fol. 6488] 2.5.2 Cross-sectional Areas

2.5.2.1 In stranded conductors, the area of cross-section of the completed conductor shall be not less than 98 percent of the area given in Table 1 and not less than 97 percent of the area given in Table 1 for 18 and 20 Awg conductors made with 30 Awg strands when measured in accordance with 6.3.4.

2.5.2.2 In rope-lay-stranded conductors having bunch-stranded members (Classes I, K and M), the number of individual wires may vary from that given in Tables 4, 5 or 6, provided the cross-sectional area of the conductor is in accordance with 2.5.2.1.

2.5.2.3 The cross-sectional area of a stranded conductor shall be the sum of its component wires at any point, when measured in accordance with 6.3.4.

2.6 Resistance of Conductors

2.6.1 The direct-current resistance of solid or Class B stranded coated conductors at 20 C or 25 C shall not exceed the values given in Table 7.

The direct-current resistance of solid or Class B stranded uncoated conductors at 20 C or 25 C shall not exceed by more than 2 percent the values given in Table 7.

2.6.2 For flexible stranded conductors and for sizes not listed in Table 7, the direct-current resistance at 20 C or 25 C shall be not greater than that calculated from the factors given in Table 8.

2.6.3 In completed multiple-conductor cables the increase in resistance due to conductor cabling lay shall not exceed the values given in Tables 7 and 8 by more than the following percentages:

(*a*) One layer of conductors	2
(*b*) More than one layer of conductors	3
(*c*) Pairs or other pre-cabled units	4

2.6.4 When the direct-current resistance is measured at other than 20 C or 25 C, it shall be corrected by using the multiplying factors given in Tables 9 and 10.

Factors for temperatures other than those given in the tables shall be obtained by interpolation or shall be calculated from the formulae given in the footnotes to Tables 9 and 10.

2.5.1 Diameters

[fol. 6489]

Part 7

Construction of Specific Types

The requirements of Parts 1 through 6 shall be met except as otherwise modified in Part 7.

7.1 Pole and Bracket Table

7.1.1 *Scope.* This section applies to flat-twin pole and bracket cable insulated with polyvinyl chloride and belted with polyethylene. This cable is intended for use in series street lighting circuits in both interior and exterior installations for operation at temperatures not exceeding 75 C. The conductor sizes covered are 10, 8 and 6 Awg. The insulation and belt thicknesses are based on a maximum of 600 volts between conductors and on open-circuit voltages from 4000 to 10000 volts.

7.1.2 *Conductors*

7.1.2.1 The conductors shall be of annealed uncoated copper or annealed coated copper and shall meet the requirements of 2.1.1 and 2.3.

7.1.2.2 The sizes, minimum number of strands, average cross-sectional areas and approximate diameters of the conductors shall be as follows:

Size Awg	Minimum Number of Strands/Conductor	Average Cross-sectional Area, Circular Mils	Approximate Diameter, Inches
10	19	10,380	0.117
8	19	16,510	0.148
6	19	26,240	0.186

The area of cross-section of any conductor shall be not less than 98 percent of the area given in the above table.

7.1.3 *Insulation*

7.1.3.1 The polyvinyl chloride insulation shall meet the requirements given in 3.7, except that both the tensile strength and elongation after 168 hours at 100 ± 1 C shall be not less than 85 percent of the unaged values, and the cold bend test shall be conducted at minus 30, plus or minus 1 C.

7.1.3.2 The average thickness of the insulation shall be not less than that given in Table 45. The minimum thickness shall be not less than 90 percent of the values given in the table. The thickness shall be measured in accordance with 6.4.3.

7.1.3.3 One conductor shall be colored black and the other white or natural.

7.1.4 *Conductor Assembly.* The two insulated conductors shall be laid flat and parallel.

7.1.5 *Belt*

7.1.5.1 The belt shall be a heat- and light-stabilized black polyethylene insulation and shall meet the physical and aging requirements for polyethylene insulation as given in 3.9.1. It shall be applied in a flat configuration. Fillers shall not be used. The belt insulation shall fill the interstices of the cable.

7.1.5.2 The average thickness of the belt shall be not less than that given in Table 45.

7.1.6 *Electrical Tests*

7.1.6.1 The completed cable shall withstand the following voltage tests after being immersed in water for at least 6 hours.

7.1.6.2 An alternating-current test voltage of 3000 volts shall be applied between conductors for 5 minutes.

7.1.6.3 The conductors shall be connected together, and the alternating-current and direct-current test voltages given in Table 45 shall be applied between the conductor and water.

7.1.7 *Cold Bend Test.* The polyethylene belt shall not show any cracks when conditioned and tested in accordance with 6.4.15.1. The cable shall be bent around its minor axis. The insulated conductor diameter given in 6.4.15.1 shall be taken as the minor axis of the cable. Cracking of the polyvinyl chloride insulation on the individual conductors under this test shall not constitute failure.

7.1.8 *Outside Diameters.* The outside diameters of the completed cable shall be not less than that given in Table 45, with a tolerance of plus 10 percent.

[fol. 6490]

Table 45

Construction and Test Requirements for Pole and Bracket Cable

Open-circuit Voltage, Volts	Conductor Size, Awg	Thickness, Mils		Minimum Outside Diameter, Inches		Test Voltages, Kv	
		Insulation	Belt	Major	Minor	A-C 5 Min	D-C 15 Min
4001–6000	10	47	94	0.610	0.400	13.0	39.0
	8	47	94	0.670	0.430	13.0	39.0
	6	62	94	0.810	0.500	13.0	39.0
6001–10000	10	47	109	0.640	0.430	17.0	51.0
	8	47	109	0.700	0.460	17.0	51.0
	6	62	109	0.840	0.530	17.0	51.0

7.1.9 *Bending Radius**. The minimum radius to which these cables may be bent around their minor axis in service is 2 inches, with a maximum of ½ turn (180-degree U bend).

7.1.10 *Terminations**. Suitable high-temperature terminations are recommended where the cable will be exposed to temperatures, in close proximity to the luminaire, in excess of 75 C.

[fol. 6491] 7.2 Polyvinyl-chloride-insulated Cotton-braided Switchboard Wire and Cable

7.2.1 *Scope.* This section covers single-conductor switchboard wire and cable insulated with polyvinyl chloride and covered with a cotton braid, in sizes 14 through 4/0 Awg with copper conductors and 12 Awg through 350 MCM with aluminum conductors. The wire or cable is suitable for operation at conductor temperatures of 90 C (194 F) and less, in dry locations, at a maximum voltage rating of 600 volts.

---

* These paragraphs have been approved by NEMA as Authorized Engineering Information.

It is similar to but may differ from Underwriters' Laboratories, Inc., Type TBS.

7.2.2 *Conductors*

7.2.2.1 *Copper.* Copper conductors shall be annealed coated or uncoated copper and shall meet the requirements of 2.1.1 and 2.3. Sizes 14 though 4 Awg shall be either solid or Class B stranded in accordance with Table 1. Sizes 3 Awg through 4/0 Awg shall be Class B stranded.

7.2.2.2 *Aluminum.* Aluminum conductors shall be "EC" grade and shall meet the requirements of 2.1.2 and 2.3. Sizes 12 through 4 Awg shall be either solid or Class B stranded in accordance with Table 1. Sizes 3 Awg through 350 MCM shall be Class B stranded.

7.2.3 *Separator.* A separator, when used, shall consist of a helical or longitudinal wrapping of paper or other suitable material.

7.2.4 *Insulation*

7.2.4.1 The insulation shall consist of an extruded polyvinyl chloride (or its copolymer with vinyl acetate) compound. When tested in accordance with Part 6, the insulation shall meet the following requirements:

Physical Requirements	
Tensile strength, minimum, psi	1500
Elongation at rupture, minimum, percent	100
Aging Requirements—after air oven test at 121 ± 1 C for 168 hours	
Tensile strength, minimum, percentage of unaged value	70
Elongation at rupture, minimum, percentage of unaged value	65

7.2.4.2 *Insulation Thickness.* The average thickness of the insulation shall be not less than that given in Table 46. The minimum thickness shall be not less than 90 percent of the values given in the table.

Table 46

Insulation Thickness

Conductor Size, Awg or MCM *	Insulation Thickness, Mils
14–10	31
8	47
6–2	62
1–4/0	78
225–350†	94

* MCM—thousands of circular mils.
† Aluminum conductors only.

7.2.5 *Covering and Finish*

7.2.5.1 *Braid.* A closely woven soft cotton braid meeting the requirements for Class B braids given in 4.5 of the *IPCEA-NEMA Standards Publication for Rubber-insulated Wire and Cable for the Transmission and Distribution of Electrical Energy,* IPCEA S-19-81 (Third Edition), NEMA WC 3-1959, shall be applied over the insulation.

7.2.5.2 *Finish.* The braid shall be impregnated with a flame-retarding compound.

7.2.6 *Tests.* The completed wire shall meet the following requirements.

7.2.6.1 *Dripping Test* After the following dripping test, the saturating compound shall not have dripped.

A 7-inch specimen of the wire or cable shall be suspended vertically in an electrically heated oven which is equipped with a suitable automatic temperature control and which has been heated to 97 ± 1 C (204.8 to 208.4 F). The specimen shall be maintained at this temperature for one hour. A piece of white paper shall be placed beneath the specimen to catch any of the compound which drips.

7.2.6.2 *Flame-retarding Requirement.* A 22-inch specimen of the wire shall meet the vertical flame test described in 6.5.

7.2.6.3 *Voltage Test.* The insulation on a 12-inch specimen of the wire shall withstand for one minute the alternating-current voltage indicated in the following table. The central 6-inch portion of the 12-inch specimen shall be wrapped in metal foil, and the voltage shall be applied between the conductor and the metal foil.

Conductor Size, Awg or MCM *	A-C Test Voltage, Volts
14–10	1500
8–2	2000
1–4/0	2500
225–350†	3000

* MCM—thousands of circular mils.
† Aluminum conductors only.

[fol. 6492] 7.3 Neutral-supported Secondary and Service Drop Cables

7.3.1 *Scope.* This section covers secondary and service drop cables composed of one or more polyethylene-insulated conductors and one neutral conductor for use as the supporting member. These cables are for use on circuits not exceeding 300 volts to ground.

7.3.2 *Conductors*

7.3.2.1 *Insulated Conductors*

7.3.2.1.1 Copper. Copper conductors shall be annealed uncoated copper and shall meet the requirements given in Part 2. Size 8 Awg shall be solid. Sizes 6 Awg and larger shall be Class B stranded in accordance with Table 1.

7.3.2.1.2 Aluminum. Aluminum conductors shall be "EC" grade, with a minimum tensile strength of 17,000 psi. Size 6 Awg shall be solid. Size 4 Awg and larger shall be Class B stranded in accordance with Table 1, except that the outer layer shall have a right-hand lay.

7.3.2.2 *Neutral Conductors.* Neutral conductors shall be uncovered or covered and the sizes and composition shall be in accordance with Table 47.

7.3.2.2.1 Copper. Copper conductors shall be hard-drawn bare copper and shall be Class B stranded in accordance with Table 1, except that sizes 6 Awg and smaller may be solid.

7.3.2.2.2 Aluminum. Aluminum conductors shall be "EC" grade, hard-drawn aluminum, stranded in accordance with

Class A, Table II, ASTM B 231*, except sizes 3/0 and 4/0 shall be 19-wire stranded.

7.3.2.2.3 Copper and Copper-covered-steel Composite. Conductors shall be concentric-lay stranded copper and copper-covered-steel composite conductors and shall meet the requirements given in the applicable sections of ASTM B 229.*

7.3.2.2.4 Aluminum Conductors—Steel Reinforced. Aluminum conductors steel reinforced, (ACSR), shall be 7-wire strand (6 aluminum around 1 steel) and shall meet the requirements of ASTM B 232.*

7.3.3 *Insulation*

7.3.3.1 *Physical and Aging Requirements.* The polyethylene insulation shall be black and, when tested in accordance with Part 6, shall meet the following requirements:

Physical Requirements	
Tensile strength, minimum, psi	1400
Elongation at rupture, minimum, percent	350
Aging Requirements—after air oven test at 100 ± 1 C for 48 hours	
Tensile strength, minimum, percentage of unaged value	75
Elongation at rupture, minimum, percentage of unaged value	75

7.3.3.2 *Thickness of Insulation.* The average thickness of the insulation shall be not less than the following:

Conductor Size, Awg	Thickness, Inches
8–2	0.045
1–4/0	0.060

The minimum thickness shall be not less than 90 percent of the foregoing values.

7.3.4 *Assembly.* One or more insulated conductors shall be twisted around the neutral conductor without fillers with a lay of 25 to 60 times the diameter of one of the insulated conductors. The direction of lay of the insulated conductors shall be the same as that of the outer layer of wires of the neutral conductor.

The size of the neutral conductor shall be in accordance with Table 47.

---

* See Appendix E.

7.3.5 *Tests.* Each length of completed cable shall successfully withstand, after one hour's immersion in water, an alternating-current voltage of 1500 volts applied for one minute between each insulated power conductor and ground.

[fol. 6493]

IPCEA-NEMA Standards Publication

Rubber-insulated Wire and Cable for the Transmission and Distribution of Electrical Energy

This publication supersedes the following:

IPCEA General Specifications for Wire and Cable with Rubber, Rubber-like and Thermoplastic Insulations, Second Edition, S-19-81

NEMA Standards for Rubber-insulated Power and Control Cable, 49-141

Approved by Insulated Power Cable Engineers Association July 15, 1958

Approved as a NEMA Standard November 13, 1958, National Electrical Manufacturers Association

[fol. 6495]

Foreword

This Standards Publication for Rubber-insulated Wires and Cables for the Transmission and Distribution of Electrical Energy (IPCEA S-19-81 Third Edition; NEMA WC 3-1959) was developed by the Insulated Power Cable Engineers Association and approved by the National Electrical Manufacturers Association.

Suggestions for improvements gained in the use of this standard will be welcomed. They should be sent to the Insulated Power Cable Engineers Association, 283 Valley Road, Montclair, N. J.

Table of Contents—Condensed

	Part	Page
General	1	1
Conductors	2	1-14
Insulation	3	1-14
Shielding and Coverings	4	1-29
Cabling, Fillers, Binders and Circuit Identification	5	1-4
Testing and Test Methods	6	1-30
Construction of Specific Types	7	1-8
Pole and Bracket Cable	7	1-2
Nonmetallic Neoprene-jacketed Mine Power Cables	7	3-4
Preassembled Aerial Cable Using Copper Conductors	7	5-6
Neutral-supported Secondary and Service Drop Cables	7	7-8
Appendices	8	1-9

For a detailed Table of Contents, see page ii.
For a detailed listing of the appendices, see page ix.
For a detailed listing of the tables contained in this publication, see page x.

[fol. 6496]

Part 1

General

1.1 Scope. These standards apply to materials, constructions and testing of rubber-insulated wires and cables which are used for the transmission and distribution of electrical energy for normal conditions of installation and service, either indoors, aerial, underground or submarine.

In classifying vulcanized insulations and jackets in these standards, the term "rubber" when used alone without further description shall mean either natural rubber or synthetic rubber, or a combination of these materials.

In classifying jackets and sheaths in these standards, the term "jacket" refers to nonmetallic coverings and "sheath" to continuous metallic coverings.

1.2 General Information. These standards cover the requirements for conductors, the various grades of insulations and protective coverings, and general constructional and dimensional details common to most standard types of wires and cables. Constructions of specific types are covered in Part 7. Where a conflict exists between the requirements of Part 7 and those of Parts 1 to 6, inclusive, the requirements of Part 7 shall apply.

1.3 Information to be Supplied by Purchaser.* When requesting proposals from cable manufacturers, the prospective purchaser should furnish the following information:

1.3.1 Characteristics of System on which Cable is to be Used

(*a*) Current—alternating or direct.
(*b*) Frequency—cycles per second.
(*c*) Normal operating voltage between phases or, if direct current, between conductors.
(*d*) Number of phases and conductors. If series lighting, give open-circuit voltage and state whether system is operated with or without protectors.
(*e*) Operated with neutral solidly grounded, grounded through resistance or reactance, or ungrounded.

---

* For the purposes of NEMA, this paragraph is approved as Authorized Engineering Information.

If grounded through resistance or reactance, state amount.

(*f*) Minimum temperature at which cable will be installed.

(*g*) Description of installation.

(*1*) In buildings.

(*2*) In underground ducts.

(*3*) Aerial.

a. On messenger in metal rings.
b. On messenger with marlin ties.
c. Preassembled.
d. Field spun.

(*4*) Direct burial in ground.

(*5*) Submarine.

(*6*) Descriptions other than the foregoing.

(*h*) Conditions of installations.

(*1*) Ambient temperature.

(*2*) Number of loaded cables in duct bank or conduit. If in conduit, give type of conduit (metallic or nonmetallic), number of loaded conduits, enclosed or exposed, and spacing between conduits.

(*3*) Load factor.

(*4*) Method of bonding and grounding of lead sheaths.

(*5*) Wet or dry location.

1.3.2 *Quantities and Description of Cable*

(*a*) Total number of feet, including test lengths, and lengths if specific lengths are required.

(*b*) Type of cable. Describe as single conductor, 2-conductor flat, 2-conductor round, etc.

(*c*) Rated circuit voltage, phase to phase.

(*d*) Type of conductor—copper or aluminum.

(*e*) Size of conductors—Awg or circular mils. If conditions require other than standard stranding, a complete description should be given.

(*f*) Grade of insulation.

(*g*) Thickness of insulation in 64ths of an inch or in mils.
(*h*) Type of outer covering.
(*i*) Maximum allowable overall diameter in inches. When duct space is not limited, it is desirable not to restrict the overall diameter.
(*f*) Method of conductor identification.

[fol. 6497]

Part 2

Conductors

2.1 Material. Part 2 covers copper conductors and aluminum conductors.

2.1.1 *Copper Conductors.* Uncoated conductors shall be of annealed copper wire in accordance with ASTM B 3, latest revision.

Coated conductors shall be of annealed copper wire in accordance with the latest revision of ASTM B 33 for tin-coated conductors or ASTM B 189 for lead- or lead-alloy-coated conductors.

The conductors, unless otherwise specified herein, shall be protected by tin, lead, or lead-alloy coating.

The continuity of tin coating shall be determined in accordance with ASTM B 33, latest revision, before the conductors are insulated or stranded.

The continuity of lead and lead-alloy coatings shall be determined in accordance with ASTM B 189, latest revision, before the conductors are insulated or stranded.

2.1.2 *Aluminum Conductors.* Solid conductors 8 Awg and smaller shall be "EC" grade aluminum three-quarter hard in accordance with ASTM B 262, latest revision. Solid conductors larger than 8 Awg and all sizes of stranded conductors shall be "EC" grade aluminum either hard-drawn in accordance with ASTM B 230 or three-quarter hard in accordance with ASTM B 262, latest revisions. Stranded conductors shall conform to ASTM B 231, latest revision.

2.2 Solid Conductors. Conductors 8 Awg and smaller shall be solid or, when required for a particular application, stranded. Conductors 6 Awg and larger may be solid as indicated in Table 1 when required. Nominal diameters

shall be in accordance with Table 1, subject to the tolerances given in 2.5.

2.3 Stranded Conductors.

2.3.1. Conductors 6 Awg and larger shall be stranded in accordance with 2.3.3. For series lighting cable and tree wire, conductors 6 and 4 Awg may be solid.

Stranded conductors shall be composed of the number of wires given in Tables 1 through 6 and subject to the tolerances on cross-sectional areas given in 2.5. Intermediate sizes take the stranding of the next larger conductor size given in the tables.

2.3.2 Strand shielding shall be used on stranded conductors of power cables having rated circuit voltages above 2000 volts. This requirement does not apply to series lighting cables.

Strand shielding in rubber-insulated cables is a conducting material at least 0.0025 inch thick applied over the surface of the conductor and vulcanized or firmly bonded to the inner surface of the insulation. It may be conducting nonmetallic tape, conducting compound, or conducting cement.

2.3.3 *Uses of Classes of Stranding*

2.3.3.1 *Concentric-lay Conductors.* A concentric-lay conductor is a conductor composed of a central core surrounded by one or more layers of helically laid wires.

Class of Stranding *	Use
B	Power cables rated 0–2000 volts for normal use and, where strand shielding is employed (see 2.3.2), for use above 2000 volts.
C	Power cables where more flexible stranding than Class B is desired.
D	Power cables where extra flexible stranding is desired.

* See Table 1.

[fol. 6498] 2.3.3.2 *Rope-lay Conductors.* A rope-lay conductor is a conductor composed of concentric-lay stranded members or bunch-stranded members.

Classes G and H shall have concentric-lay-stranded members, and Classes I, K and M shall have bunch-stranded members.

Class of Stranding	Use
G (see Table 2)	All cables for portable use.
H (see Table 3)	All cables where extreme flexibility is required, such as for use on take-up sheaves, etc.
I (see Table 4)	Apparatus cable and motor-leads.
K (see Table 5)	Cords and cables composed of No. 30 Awg copper wires.
M (see Table 6)	Cords and cables composed of No. 34 Awg copper wires.

Other strandings are given in Part 7.

2.3.4 The individual wires used in the construction of the stranded conductor shall, before stranding, meet the requirements of 2.1.

2.3.5 The lay of concentric stranded conductors shall be in accordance with the latest revision of ASTM B 8 for copper conductors and ASTM B 231 for aluminum conductors. The lay of a layer of wires shall be not less than eight nor more than sixteen times the outside diameter of that layer, except that for conductors composed of 37 wires or more, this requirement shall apply only to the two outer layers.

The direction of lay of the outer layer shall be left-hand. The direction of lay for conductors having a nominal cross-sectional area larger than 8 Awg shall be reversed in successive layers.

2.4 Individual Wire Splices in Solid and Stranded Conductors. A splice in a solid conductor or in one of the individual wires of a stranded conductor shall be made in a workman-like manner and shall be such that the joint will not increase the diameter of the individual wire or of the conductor nor lessen its mechanical strength. A joint or splice in a stranded conductor as a whole shall be made by separately joining each individual wire in such a manner that the overall diameter of the entire stranded conductor will not be increased. In rope-stranded conductors, the primary groups used in forming the rope shall be considered the equivalent of a solid wire in a concentric stranded conductor.

2.5 Tolerances in Diameters and Cross-sectional Areas. The following tolerances apply to determinations made on conductors of the completed cable.

2.5.1 *Diameters*

	Diameter, Inches	Maximum Variation in Diameter
Solid copper conductors		
Coated	0.010 and larger	−1%, +3%
	Smaller than 0.010	−0.1 mil, +0.3 mil
Uncoated	0.010 and larger	−1%, +1%
	Smaller than 0.010	−0.1 mil, +0.1 mil
Solid aluminum conductors	0.100 and larger	−1%, +1%
	0.036 up to 0.100	−1 mil, +1 mil
	Smaller than 0.036	−0.5 mil, +0.5 mil

[fol. 6499] 2.5.2 *Cross-sectional Areas*

2.5.2.1 In stranded conductors, the area of cross-section of the completed conductor shall be not less than 98 per cent of the area given in Table 1 for 18 and 20 Awg conductors made with 30 Awg strands when measured in accordance with 6.3.4.

2.5.2.2 In rope-lay-stranded conductors having bunch-stranded members (Classes I, K and M), the number of individual wires may vary from that given in Tables 4, 5 or 6, provided the cross-sectional area of the conductor is in accordance with 2.5.2.1.

2.5.2.3 The cross-sectional area of a stranded conductor shall be the sum of its component wires at any point, when measured in accordance with 6.3.4.

2.6 Resistance of Conductors

2.6.1 The direct-current resistance of solid or Class B stranded conductors at 20 C or 25 C shall not exceed the values given in Table 7.

2.6.2 For flexible stranded conductors and for sizes not listed in Table 7, the direct-current resistance at 20 C or 25 C shall be not greater than that calculated from the factors given in Table 8.

2.6.3. In completed multiple-conductor cables the increase in resistance due to conductor cabling lay shall not exceed the values give- in Tables 7 and 8 by more than the following percentages:

(*a*) Non-portable cables:
- (*1*) One layer of conductors 2
- (*2*) More than one layer of conductors 3
- (*3*) Pairs or other pre-cabled units 4

(*b*) Portable cords and cables 5

2.6.4 When the direct-current resistance is measured at other than 20 C or 25 C, it shall be corrected by using the multiplying factors given in Tables 9 and 10.

Factors for temperatures other than those given in the tables shall be obtained by interpolation or shall be calculated from the formulae given in the footnotes to Tables 9 and 10.

[fol. 6500]

Part 7

Constructions of Specific Types

The requirements of Parts 1 through 6 shall be met except as otherwise modified in Part 7

7.1 Pole and Bracket Cable

7.1.1 *Scope.* This section covers the following types of rubber-insulated two-conductor pole and bracket cables for use in series lighting circuits:

Type A—Belted cable having a belt of insulation and a fibrous covering over the insulated conductors.

Type B—Flat twin cable having only a fibrous covering over the insulated conductors.

Conductor sizes are 10, 8 and 6 Awg, and insulation thicknesses are based on a maximum of 600 volts between conductors and from 600 to 10000 volts between conductors and ground.

Recommended bending radii are given in Appendix F.

7.1.2 *Conductors*

7.1.2.1 The conductors shall be of coated copper and shall meet the requirements of 2.1.1 and 2.3.

7.1.2.2 The sizes, minimum number of strands, average cross-sectional areas and approximate diameters of the conductors shall be as follows:

Size, Awg.	Minimum Number of Strands/Conductor	Average Cross-sectional Area, Circular Mils	Approximate Diameter, Inches
10	19	10,380	0.117
8	19	16,510	0.148
6	19	26,240	0.186

The area of cross-section of any conductor shall be not less than 98 per cent of the area given in the above table.

7.1.3 *Insulation.* The insulation shall be one of the grades given in Table 11.

The average thickness of the insulation shall be not less than that given in Table 57. The minimum thickness shall be not less than 90 per cent of the values given in the table.

7.1.4 *Tape or Braid Over the Individual Conductor*

7.1.4.1 A tape or braid shall be applied over the insulation of each conductor.

7.1.4.2 Tape, where used, shall meet the requirements of 4.4.

7.1.4.3 Braid, where used, shall meet the requirements for Class B braids given in 4.5. Where circuit identification (see 7.1.5) is obtained by means of colors, the braids shall be suitably treated. Where circuit identification is obtained by means of one conductor having a pronounced large size thread tracer, the braids shall be saturated with a weather-resisting compound.

7.1.5 *Circuit Identification.* Circuit identification shall be obtained either by means of colored braids or tapes which shall be one black and one white, or by having a pronounced large size thread tracer on one conductor.

7.1.6 *Belted Cables*

7.1.6.1 In belted cable, the two insulated and taped or braided wires shall lay flat and parallel and a belt of insulation which meets the requirements of 7.1.3 shall be applied in either a round or oval shape. Fibrous fillers shall not be used. The belt insulation shall thoroughly fill the interstices of the cable.

7.1.6.2 The average thickness of the belt shall be not less

than that given in Table 57. The minimum thickness shall be not less than 90 per cent of the values given in the table.

7.1.6.3 A tape and braid or a double braid shall be applied over the belt insulation.

7.1.6.4 A tape, where used over the belt insulation, shall be compound-filled in accordance with 4.4.

[fol. 6501] 7.1.6.5 Both inner and outer braids, where used over the belt insulation, shall meet the requirements for Class B braids given in 4.5 and shall be saturated with a moisture-resisting compound.

7.1.7 *Flat Twin Cable.* A Class B braid which meets the requirements of 4.5 shall be applied over the parallel insulated and taped or braided conductors. The braid shall be saturated and finished with a moisture-resisting compound.

7.1.8 *Voltage Test*

7.1.8.1 The completed cable shall withstand the following voltage tests after being immersed in water for at least 6 hours.

7.1.8.2 On belted cables, an alternating-current test voltage of 3000 volts shall be applied between conductors for 5 minutes.

7.1.8.3 On belted and flat twin cables, the conductors shall be connected together, and the alternating-current test voltage given in Table 57 shall be applied between the conductor and water for 5 minutes.

7.1.9 *Outside Diameters.* Nominal outside diameters of the completed cables shall be in accordance with Table 57 with a tolerance of plus or minus 5 per cent.

Table 57

Pole and Bracket Cable

Open-circuit Voltage, Volts	Conductor Size, Awg	Thickness of Insulation and Belt, 64ths of an Inch			Nominal Outside Diameter	A-C Test Voltage, Kv

	6	4	8	12	1.04	17.0	15.0

[fol. 6502] 7.2 Nonmetallic Neoprene-jacketed Mine Power Cables

7.2.1 *Scope.* This section covers heat-, moisture- and ozone-resisting rubber-insulated shielded, three-conductor, neoprene-jacketed cables with grounding conductors in sizes 6 to 4/0 Awg for nominal alternating-current voltage service of 5 and 10 kv. They are available with two grades of insulation for operation at maximum conductor temperatures of either 75 C or 85 C.

The approximate phase-to-phase 60-cycle voltage drop per ampere per 1000 feet at various circuit power factors and ampacities are given in Appendix C. Recommended bending radii are given in Appendix F.

7.2.2 *Power and Grounding Conductors*

7.2.2.1 Power conductors, except for bore-hole and shaft cables, shall be of annealed coated copper wire and shall meet the requirements given in Part 2.

7.2.2.2 Power conductors for borehole and shaft cables shall be of annealed coated copper wire or, when the factor of safety as calculated by the following formula is less than 7, of medium hard-drawn coated copper in accordance with ASTM B 246 before stranding.

$$F = \frac{AT}{W}$$

where

F—Factor of safety.
A—Area of the three power conductors in square inches.
T—Tensile strength of copper in pounds per square inch (24000 for annealed copper and 40000 for medium hard copper).
W—Weight of the cable in pounds.

The conductor stranding shall be Class B or Class C in accordance with Part 2 and Table 58.

7.2.2.3 Grounding conductors shall be of annealed coated copper wire, shall meet the requirements of Part 2, and shall be Class B stranded. One grounding conductor shall be placed in each interstice of the cable in contact with

metallic shielding. The size of each grounding conductor shall be in accordance with Table 58. The aggregate total cross-sectional area of the three grounding conductors shall be not less than 90 per cent of the area of one power conductor. The minimum size of an individual grounding conductor shall be 10 Awg.

7.2.3 *Strand Shielding.* Strand shielding (see 2.3.2) shall be applied over the power conductors.

7.2.4 *Insulation.* The insulation shall be in accordance with Part 3.

The insulation for 75 C operation shall meet the requirements of 3.14 or 3.15.

The insulation for 85 C operation shall meet the requirements of 3.15.

The average thickness of insulation shall be not less than that given in Table 58 for grounded and ungrounded neutral circuits. The minimum thickness shall be not less than 90 per cent of the values given in the table.

Note: A circuit is considered to have a grounded neutral if it is metallically continuous to a point where the neutral is permanently connected to earth and if facilities are provided to insure prompt isolation of a faulty element of a system of which the circuit is a part.*

7.2.5 *Conductor or Circuit Identification.* Conductors shall be identified by a tape in accordance with 5.6.1.

7.2.6 *Metallic Shielding.* Metallic shielding, in accordance with Part 4, shall be applied over the individual conductors.

7.2.7 *Jacket.* A neoprene jacket which meets the requirements of 4.13.3 and Table 29 shall be applied.

[fol. 6503] 7.2.8 *Overall Diameters.* The nominal overall diameters of the cables shall be in accordance with Table 58, within plus 8 per cent and minus 5 per cent.

7.2.9 *Tests.* The cables shall be tested in accordance with Part 6 and shall meet the requirements given in Part 3 and 7.2.

---

* For the purposes of NEMA, this note is approved as Authorized Engineering Information.

The corona levels shall be as follows:

Voltage Classification, Kv	Minimum Corona Level, Kv Grounded Neutral	Ungrounded Neutral
5	3.2	5.0*
10	6.4	8.9

* Unless otherwise indicated, the cable will be rated grounded neutral.

Table 58

[fol. 6504] 7.3 Preassembled Aerial Cable Using Copper Conductors.

7.3.1 *Scope.* This section covers preassembled aerial cables with one or more copper conductors in Sizes 6 Awg to 500 MCM which are individually insulated with a rubber compound and covered and which are attached to a messenger to form self-supporting aerial cables for use on power transmission and distribution systems operating at 15 kv or less phase to phase.

The characteristics of the completed assembly shall be such that the cable can be installed at a minimum temperature of minus 10 C (14 F).

Ampacities and recommended bending radii are given in Appendices E and F, respectively.

7.3.2 *Conductors.* All insulated power conductors shall be of annealed coated copper in accordance with Part 2. The conductors shall be Class B or Class C stranded in accordance with Part 2 except that, when required, size 6 Awg may be solid. For ratings above 2000 volts, each stranded conductor shall be covered with strand shielding in accordance with 2.3.2.

7.3.3 *Insulation.* The insulation shall be applied in accordance with the applicable sections of Part 3. The average thickness of the insulation shall be not less than that given in Table 12. The minimum thickness shall be not less than 90 per cent of the values given in the table.

For cables rated 2000 volts or less, the insulation shall be one of the grades given in Table 11. For cables rated above 2000 volts, the insulation shall be in accordance with 3.14 or 3.15.

7.3.4 *Coverings.* The covering over the insulation of each conductor shall be in accordance with one of the following:

Type	Description	Maximum Operating Voltage, Phase to Phase, Kv	
		Grounded Neutral	Ungrounded Neutral
I	Nonshielded, jacketed	5	5
II	Shielded, nonjacketed	15	15
III	Shielded, jacketed	15	15

7.3.4.1 *Type I.* A jacket of nonconducting neoprene compound which meets the requirements of 4.13.4 and Table 27 shall be applied over the insulation of each conductor.

7.3.4.2 *Type II.* A fibrous or other nonmetallic tape shall be applied over the insulation of each conductor. The tape shall be either conducting or nonconducting and, if conducting, shall be so marked. An additional fibrous tape may be applied over the first tape. Over the tape or tapes, a helically wrapped nonmagnetic stainless steel, nonmagnetic monel or bronze shielding tape have a thickness of at least 0.0045 inch shall be applied with a lap of not less than 15 per cent of its width.

7.3.4.3 *Type III.* A fibrous or other nonmetallic tape shall be applied over the insulation of each conductor. The

tape shall be either conducting or nonconducting and, if conducting, shall be so marked. An additional fibrous tape may be applied over the first tape. Over the tape or tapes, a helically wrapped metallic shielding tape which meets the requirements of 4.1 shall be applied. A fibrous tape which meets the requirements of 4.4 may be applied over the shielding. A jacket of nonconducting neoprene compound which meets the requirements of 4.13.4 and Table 28 shall be applied over the shielding tape or, if used, over the fibrous tape.

7.3.5 *Conductor or Circuit Identification.* Each conductor of multiple-conductor cable shall be permanently marked so that conductor identification may be made without exposing the insulation. Identification shall be made by means of colored jackets, ribs on the outer surface of jackets, or by embossing letters or numerals on the outer covering.

Single-conductor cable shall not be identified.

Jacketed cables shall be identified to indicate the manufacturer.

7.3.6 *Assembly.* The conductors shall be cabled together with a suitable lay. The messenger shall be laid parallel to the axis of a single conductor or the cabled conductors. The cabled conductors shall be bound to the messenger by means of a soft-copper binding strip. The binding strip shall have a pitch of from 3 to 6 inches, shall be rectangular with rounded edges, and shall have the following nominal dimensions:

[fol. 6505]

Diameter of Cable Assembly, Excluding Messenger, Inches	Binding Strip	
	Thickness, Inches	Width, Inches
0–1.000	0.025	0.250
1.001 and over	0.030	0.375

The messenger shall extend 5 feet beyond each end of the conductors for use in installing the cable.

7.3.7 *Messenger Sizes.* The messenger shall be either composite stranded copper and copper-covered steel in accordance with ASTM B 229, or Grade 30 EHS stranded copper-covered steel in accordance with ASTM B 228.

The messenger sizes shall be as follows. These sizes are expressed as designations for single-conductor cables and as messenger diameters in inches for multiple-conductor cables.

Conductor Size, Awg or MCM*	Messenger Sizes Cable Voltage Rating Up to 5 Kv, Inclusive	6 to 15 Kv, Inclusive
	Single Conductor	
6†	6D	6D
4†	4D	4D
2†	2J	2J
	Two and Three Conductor	
6†	5/16	5/16
4†	5/16	5/16
2†	5/16	5/16
1	5/16	5/16
1/0	5/16	5/16
2/0	5/16	5/16
3/0	5/16	5/16
4/0	5/16	5/16
350	1/2	1/2
500.	1/2	1/2

* MCM—thousands of circular mils.
† See limits on conductor size in Table 12.

7.3.8 *Design Criteria.** The messenger size shall be based on a normal stringing tension at 60 F not exceeding 30 per cent of the ultimate strength and a maximum tension not exceeding 50 per cent of ultimate strength at fully loaded condition. The tabulation of messenger sizes given in 7.3.7 apply to grounded neutral cables up to 4/0 Awg on the basis of a 150-foot ruling span, 30 inches maximum sag under normal conditions, and after heavy loading conditions of ½ inch ice and 8 pound wind at 0° F. One-half inch messenger is the largest size messenger listed in the table and, for cable sizes over 500 MCM, greater sags or shorter spans should be used. For single-phase circuits, the resistance of the messenger should be not greater than that of the conductor.

7.3.9 *Tests.* The cable shall be tested in accordance with Part 6 and shall meet the requirements of Part 3 and 7.3.

* For the purposes of NEMA, this paragraph is approved as Authorized Engineering Information.

The final test voltage shall be 80 per cent of the test voltage specified in Table 12. Cables with Type I covering shall be immersed in water during the final test.

[fol. 6506] 7.4 Neutral-supported Secondary and Service Drop Cables

7.4.1 *Scope.* This section covers secondary and service drop cables composed of one or more neoprene-insulated conductors and one neutral conductor for use as the supporting member. These cables are for use on circuits not exceeding 300 volts to ground.

7.4.2 *Conductors*

7.4.2.1 *Insulated Conductors*

7.4.2.1.1 Copper. Copper conductors shall be annealed uncoated copper and shall meet the requirements given in Part 2. Size 8 Awg shall be solid. Sizes 6 Awg and larger shall be Class B stranded in accordance with Table 1.

7.4.2.1.2 Aluminum. Aluminum conductors shall be "EC" grade, with a minimum tensile strength of 17,000 psi. Size 6 Awg shall be solid. Size 4 Awg and larger shall be Class B stranded in accordance with Table 1, except that the outer layer shall have a right-hand lay.

7.4.2.2 *Neutral Conductors.* Neutral conductors shall be uncovered or covered and the sizes and composition shall be in accordance with Table 59.

7.4.2.2.1 Copper. Copper conductors shall be hard-drawn bare copper and shall be Class B stranded in accordance with Table 1, except that sizes 6 Awg and smaller may be solid.

7.4.2.2.2 Aluminum. Aluminum conductors shall be "EC" grade, hard-drawn aluminum, stranded in accordance with Class A, Table II, ASTM B 231, except sizes 3/0 and 4/0 shall be 19-wire stranded.

7.4.2.2.3 Copper and Copper-covered-steel Composite. Conductors shall be concentric-lay stranded copper and copper-covered steel composite conductors and shall meet the requirements given in the applicable sections of ASTM B 229.

7.4.2.2.4 Aluminum Conductors—Steel Reinforced. Aluminum conductors steel reinforced, (ACSR), shall be 7-wire strand (6 aluminum around 1 steel) and shall meet the requirements of ASTM B 232.

7.4.3 *Insulation*

7.4.3.1 *Physical and Aging Requirements.* The neoprene insulation shall be black and, when tested in accordance with Part 6, shall meet the following requirements:

Physical Requirements	
Tensile strength, minimum, psi	1200
Elongation at rupture, minimum, per cent	250
Set in 2-inch gauge length, maximum, inches	5/8
Aging Requirements	
After air oven test at 70 ± 1 C for 168 hours:	
Tensile strength, minimum, percentage of unaged value	75
Elongation at rupture, minimum, percentage of unaged value	65
After oxygen pressure test at 70 ± 1 C for 96 hours:	
Tensile strength, minimum, percentage of unaged value	75
Elongation at rupture, minimum, percentage of unaged value	65
After oil immersion test at 121 ± 1 C for 18 hours:	
Tensile strength, minimum, percentage of unaged value	60
Elongation at rupture, minimum, percentage of unaged value	60

7.4.3.2 *Thickness of Insulation.* The average thickness of the insulation shall be not less than the following:

Conductor Size, Awg	Thickness, Inches
8–2	0.062
1–4/0	0.078

The minimum thickness shall be not less than 90 percent of the foregoing values.

7.4.4 *Assembly.* One or more insulated conductors shall be twisted around the neutral conductor without fillers with a lay of 25 to 60 times the diameter of one of the insulated conductors. The direction of lay of the insulated conductors shall be the same as that of the outer layer of wires of the neutral conductor.

The size of the neutral conductor shall be in accordance with Table 59.

[fol. 6507] 7.4.5 *Tests.* Each length of completed cable shall successfully withstand, after one hour's immersion in water, an alternating-current voltage of 1500 volts applied for one minute between each insulated power conductor and ground.

Table 59

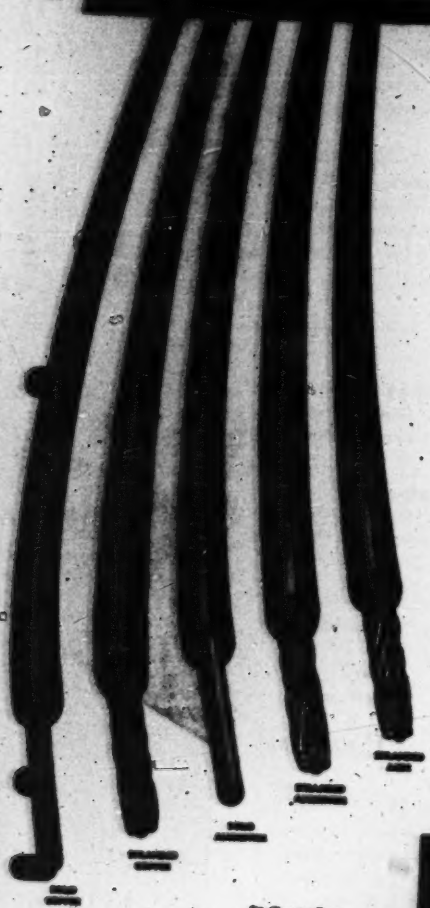
Rome RoPrene



NEOPRENE COVERED WEATHERPROOF WIRE

Copper, Aluminum and Aluminum-Steel Reinforced (ACSR) Conductors

Resists Moisture, Sunlight, Weathering, Corrosive Atmospheres, Abrasion

Lighter Weight and Smaller Diameter

Smoother, Easier to Pull Over Crossarms

Nonrolling and Nonfestooning

Easier to Strip Clean

Rome RoPrene (Neoprene) Covered Weatherproof Wire provides extra service life because it is inherently tough. It has exceptional weathering stability, is unaffected by industrial fumes and is easier to handle.

RoPrene weatherproof compound provides an homogeneous, seamless covering and is completely vulcanized, i.e., thermosetting. In addition to its many desirable physical characteristics, RoPrene has insulating properties which are much superior to the more conventional fibrous coverings. RoPrene Weatherproof Wire may be used, and is recommended, for the same applications as identical sizes of braided and knitted types of weatherproof. Methods of handling and installation are the same as for the braided and knitted types.

Further, with RoPrene covering reduced wall thicknesses are possible. The result is a smaller and lighter wire. RoPrene Weatherproof is smoother, easier to pull over crossarms. Its smaller diameter and rubber-like surface make it easy to handle.

RoPrene Weatherproof Wire is manufactured in accordance with ASA specifications for weather-resistant wire, Neoprene type.

It Costs Less to Buy the Best

ROME CABLE Corporation

ROME CABLE ROME, N.Y.

[fol. 6510]

RoPrene Weatherproof Wire

SCOPE:

This specification covers Neoprene weather-resistant wire, manufactured in accordance with the requirements of the American Standards specifications for Weather-resistant Wire and Cable, Neoprene Type.

CONDUCTORS:

Before covering, the copper, aluminum or ACSR conductors shall be in accordance with the latest issue of ASA and ASTM specifications as applicable. Tolerances for tensile strength and elongation after covering shall be in accordance with the ASA specification for Weather-resistant Wire, Neoprene Type.

COVERING:

The conductor shall be covered with a tight-fitting seamless RoPrene (Neoprene) compound complying with ASA specifications to the average wall thicknesses shown in the table.

PHYSICAL PROPERTIES OF ROPRENE

Tensile strength, min. psi	1400
Elongation at rupture, min. percent	250
Set in 2-inch gauge length, max. in.	3/8
Tensile strength after 96 hrs. in oxygen bomb @ 70C and 300 psi, min. psi	75% of original
Elongation at rupture after 96 hrs. in oxygen bomb at 70C and 300 psi, min. percent	65% of original
Tensile strength after 18 hrs. in oil @ 121C, min. psi	60% of original
Elongation at rupture after 18 hrs. in oil @ 121C, min. percent	60% of original

The minimum wall thickness at any one point shall not be more than 5 mils below the specified average for thickness 3/64 inch and under, and not more than 10 percent below the specified average for 4/64 inch and over.

WEIGHTS AND TOLERANCES:

The average weight of the covering in any lot of any one size or type manufactured under this specification shall vary not more than plus or minus 15 percent of the nominal weights as listed in the tables. The finished wire weights listed in the tables are nominal weights only and are subject to conductor and covering weight tolerances.

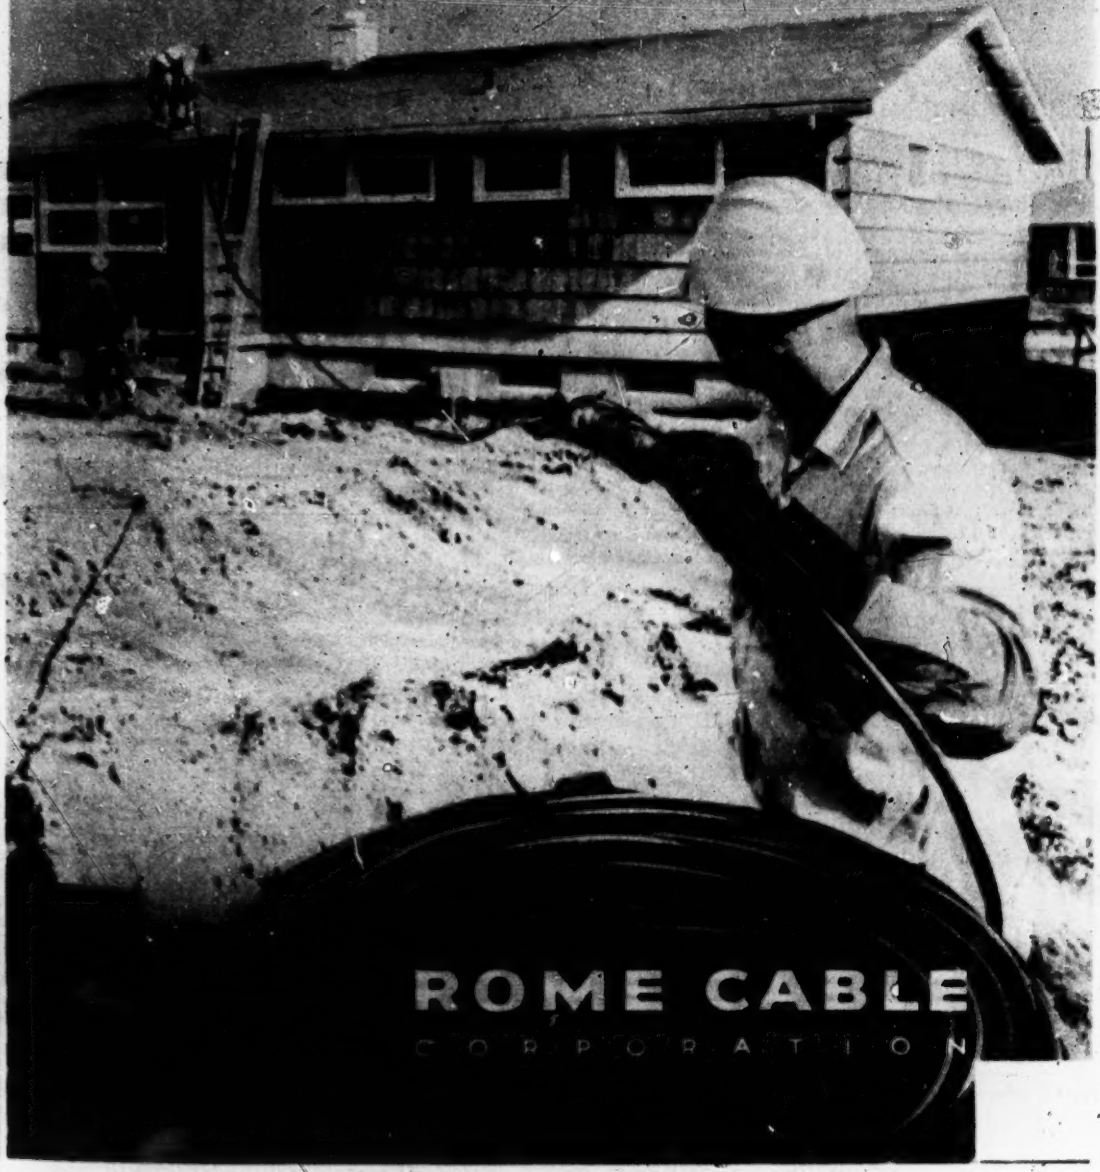
Reprene and Rolene Insulated

Neutral-Supported Secondary and Service Drop Cables

with copper or aluminum power conductors



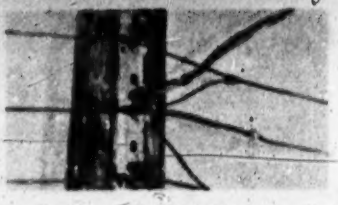
[fol. 6514]

This original Rome Cable development of time-proven construction, Reprene or Rolene Service Drop and Secondary Cable consists of Reprene (Neoprene) or Rolene (polyethylene) insulated power conductors spiralled around a "straight-away" neutral conductor for mechanical support. It offers simplicity in construction, economy of installation, longer life under all weather conditions . . . plus the neater appearance of a single cable assembly compared to open wires.

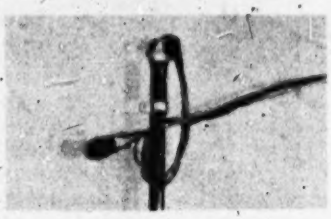
You get these advantages when you install Rome's Triplex

1. Rapid, simple installation because of compactness and less handling
2. Clean, neat appearance (no unsightly multiple wires)
3. High resistance to ice-loading, high wind and other severe winter conditions
4. Maximum protection against sunlight, heavy moisture, corrosive atmospheres and abrasion
5. Mid-span tapping of secondaries permits longer spans and fewer poles
6. Better voltage regulation on secondaries (lower reactance in long and heavily loaded circuits)
7. Eliminates the necessity of using crossarms
8. Less hardware
9. Provides a safer pole for future maintenance work by allowing free climbing and more working area

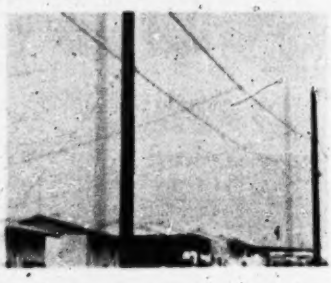
Over ten years ago, Rome Cable pioneered the development of this interesting and economical cable, which may be used for service drops, overhead multiple street lighting circuits, or for overhead secondary cable. Years of trouble-free service have proved the economy and utility of this cable construction.



Less Hardware needed for service tap connection at the pole.



Simplified dead-head connection at the house or industrial establishment



Mid-span taps permit longer spans with fewer poles

SPECIFICATIONS

for Neutral-supported Secondary and Service Drop Cables

SCOPE

This specification applies to secondary and service drop cable consisting of one or more power conductors covered with insulating Roprene (polychloroprene) or Rolene (polyethylene) and twisted around a neutral messenger. This product which is most generally a duplex (2 conductors), triplex (3 conductors), or quadrex (4 conductors) type, is intended for service drops and overhead secondary applications. This specification is based upon IPCEA standards.

CONDUCTORS

A. Power

1. Copper power conductors shall be soft annealed bare copper conforming to ASTM specification B 3. Size No. 8 AWG shall be solid. Sizes No. 6 AWG and larger shall be Class B stranded in accordance with ASTM specification B 8.
2. Aluminum power conductors shall be "EC" grade with a minimum tensile strength of 17,000. psi. Size No. 6 AWG shall be solid. Sizes No. 4 AWG and larger shall be Class B stranded in accordance with ASTM specification B 231.

B. *Neutral Messenger

1. Copper conductors shall be hard-drawn bare copper stranded in accordance with Class B, ASTM specification B 8, except No. 6 AWG and smaller may be solid.
2. Aluminum conductors shall be "EC" grade, hard-drawn aluminum stranded in accordance with Class A, ASTM specification B 231, except sizes No. 3/0 and 4/0 shall be 19-wire stranded.
3. Copperweld conductors shall be stranded copper and copper covered steel composite conductors in accordance with the applicable sections of ASTM specification B 229.
4. ACSR (aluminum cable, steel reinforced) conductors shall be 7 strand (6 aluminum around 1 steel) in accordance with ASTM specification B 232.

*A double braid, Roprene or Rolene type of weatherproof wire will be supplied for the neutral conductor when specifically requested.

INSULATION

1. Polychloroprene

The power conductors shall be covered with insulating Roprene to a minimum wall thickness of at least 90% of the specified values.

The nominal thickness of insulation shall be 4/64" on sizes No. 8 to No. 2 AWG, and 5/64" on sizes No. 1 to No. 4/0 AWG.

Physical Properties of Polychloroprene	
Tensile strength, min. psi	1200
Elongation at rupture, min. percent	250
Set in 2 in. gauge length, max. in	⅝
Tensile strength after 96 hrs. in oxygen-bomb test, min. psi	75% of original
Elongation at rupture after 96 hrs. in oxygen-bomb test, min. percent	65% of original
Tensile strength after 168 hrs. in air oven test @ 69-71 c., min. psi	75% of original
Elongation at rupture after 168 hrs. in air oven test @ 69-71 c., min. percent	65% of original
Tensile strength after 18 hrs. in oil (ASTM-D732) @ 120-122 c., min. psi	60% of original
Elongation at rupture after 18 hrs. in oil (ASTM-D732) @ 120-122 c., min. percent	60% of original

2. Polyethylene

The power conductors shall be covered with Rolene to a minimum wall thickness of at least 90% of the specified values. The nominal thickness of insulation shall be 3/64" for sizes No. 8 to No. 2 AWG and 4/64" for sizes No. 1 to No. 4/0 AWG. Rolene insulation shall be black in color and shall be compounded to be resistant to sunlight and weathering.

Physical Properties of Polyethylene	
Tensile strength, min. psi	1400
Elongation at rupture, min. percent	350
Tensile strength after 48 hrs. in air oven test @ 98-100 c., min. psi	75% of original
Elongation at rupture after 48 hrs. in air oven test @ 98-100 c., min. percent	75% of original

ASSEMBLY

One or more power conductors shall be spirally wrapped around the neutral messenger with a lay of 25 to 60 times the diameter of one of the insulated conductors. The direction of lay shall be the same as the direction of lay of wires in the neutral conductor. The resistance of the neutral conductor shall be substantially the same as that of the insulated conductor or, as an alternate, it may be the equivalent of two AWG sizes smaller for cable having a resistance less than No. 8 AWG copper. If a reduced neutral conductor is aluminum, such reduced neutral shall be ACSR unless otherwise specified.

TESTS

All finished cable shall be immersed in water for at least one (1) hour and tested at 1500 volts for one minute without failure between each insulated conductor and ground.

PUT UP

As indicated in the accompanying tabulation, unless otherwise specified on the purchase order.

[fol. 6516]

GENERAL INFORMATION

on Rome's Neutral-supported Service Cable

This popular design is available in a large range of sizes with either one, two, or three insulated conductors spiraled around the generally uncovered neutral-messenger (this messenger is also available with appropriate coverings as required by local codes or standards).

The neutral size may be equal to, or smaller than, power conductors as desired.

Rome's self-supporting service drop cable is available with either copper or aluminum conductors as shown below. The conventional type of messenger may be stranded hard-drawn copper, Copperweld, hard-drawn aluminum, or ACSR (aluminum cable, steel reinforced). Various types of fittings and hardware are readily available.

Two types of special construction are available: (1) a rubber-insulated, neoprene-jacketed (so called "two-shot") construction; (2) a special cable covering for areas where tree abrasion is encountered. Further information on these and other special constructions will be supplied on request.

*All stranded messengers are 7 wire—ACSR is 6 aluminum and 1 steel core. Special ACSR neutral constructions available upon request.

†These sizes, insulated with Neoprene (neoprene), are covered by the accepted list of materials of the R.E.A. Duplex and Quadrex Cable information supplied upon request.

Overhead Triplex Secondary Cable

The use of more and more electrical appliances and equipment is making each residential customer increasingly "service conscious." Therefore, modern distribution systems must stress these features: better performance; neat appearance; lower cost.

A dependable power supply must be maintained by the servicing utility. Utilities must eliminate as many causes of service interruptions as possible. One of the major problems is tree damage to the power lines. In some cases, trimming trees to obtain greater clearance between tree and line or providing wider pin spacing can reduce the danger of tree damage.

But, in densely wooded areas, where tree-trimming is expensive, or in areas where tree-trimming is restricted, the use of high quality polyethylene or neoprene covered wire (such as overhead triplex secondary cable) offers the best protection against this cause of service interruptions.

The use of overhead triplex secondary cable is growing rapidly. While the material costs are somewhat higher than open-wire systems, they are usually more than offset by the reduction in installation time that is required. The neater appearance of triplex secondary systems has received good public acceptance. With this system there is an improvement in voltage regulation as a result of reduced reactance. Flicker voltage problems are minimized and the customer gets a higher average voltage.

Other advantages of overhead triplex secondary cable as compared to conventional open-wire systems are as follows:

1. Flexibility of transformer-secondary layout.
2. Less pole space is required. Normally a 35-foot pole can provide space for a transformer installation and clearance to telephone attachments. Open-wire secondaries require 40-foot poles.
3. Greater resistance to storm damage.
4. Overhead triplex secondary cable will support its services within reaching distance of the poles or in mid-span, thereby leaving the pole free of service attachments. This provides a safer pole for future maintenance work by allowing free climbing and more working area.
5. Long spans can be used because they are independent of services.

Secondary cable may also be installed in the field by using a "spinner." The spinner lashes two, three, or four single wires to an installed messenger. The messenger is first strung from the poles by means of an open saddle-type suspension clamp. The phase conductors are then pulled in and as the spinner or lashing machine is pulled along the messenger, the drum containing the lashing wire rotates around the entire assembly, binding the insulated conductors tightly to the messenger.

The most difficult problem of the overhead triplex secondary cable program has been mid-span tapping. However, newly developed clamps and connectors are now available to provide a solution to this problem. The following examples of tapping devices are offered for your information.

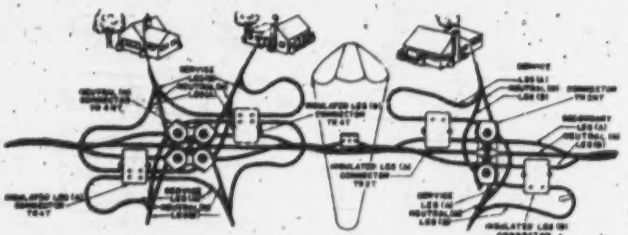
Charlie H. Wyatt, Oklahoma Gas & Electric Co., "The Use of Aerial Cable for Secondary," (Kansas City, Mo. April 1956)

TRIPL-X-TAP 3-unit Connector

Two insulated connectors plus a neutral connector comprise the compact, low cost TRIPL-X-TAP "package." This type of connection assures positive electrical joints and, through use of supporting neutrals, guarantees mechanical permanence.

(Diagrams and photo courtesy of Dessert Mfg. Corp., Brooklyn, New York)



SPANTAP INSTALLATION

Triplex secondary cable can be tapped—midspan or near the pole—economically, dependably, and neatly with connectors especially engineered for this purpose. One set of SPANTAPS—two phase units and one neutral—connects up to four Triplex services to a cabled secondary.

3354

GENERAL INFORMATION

on Rome Neutral-supported Secondary Cable

Triplex secondary cable consists of two insulated (neoprene or polyethylene) conductors spiraled around a suitable neutral-messenger. Conventional power conductor sizes are No. 1/0 to No. 4/0 AWG aluminum, while the high-strength neutral-messenger may be either stranded hard-drawn copper, Copperweld, hard-drawn aluminum, or ACSR.

The factory-assembled Triplex construction offers certain advantages for secondary use.

Elimination of cross-arms, joint pole use, reduction of hardware, ease of installation, greatly improved appearance, decreased storm vulnerability and substantially lower reactance or improved regulation, are only a few of the advantages to be realized by using secondary cable instead of open-wire construction.

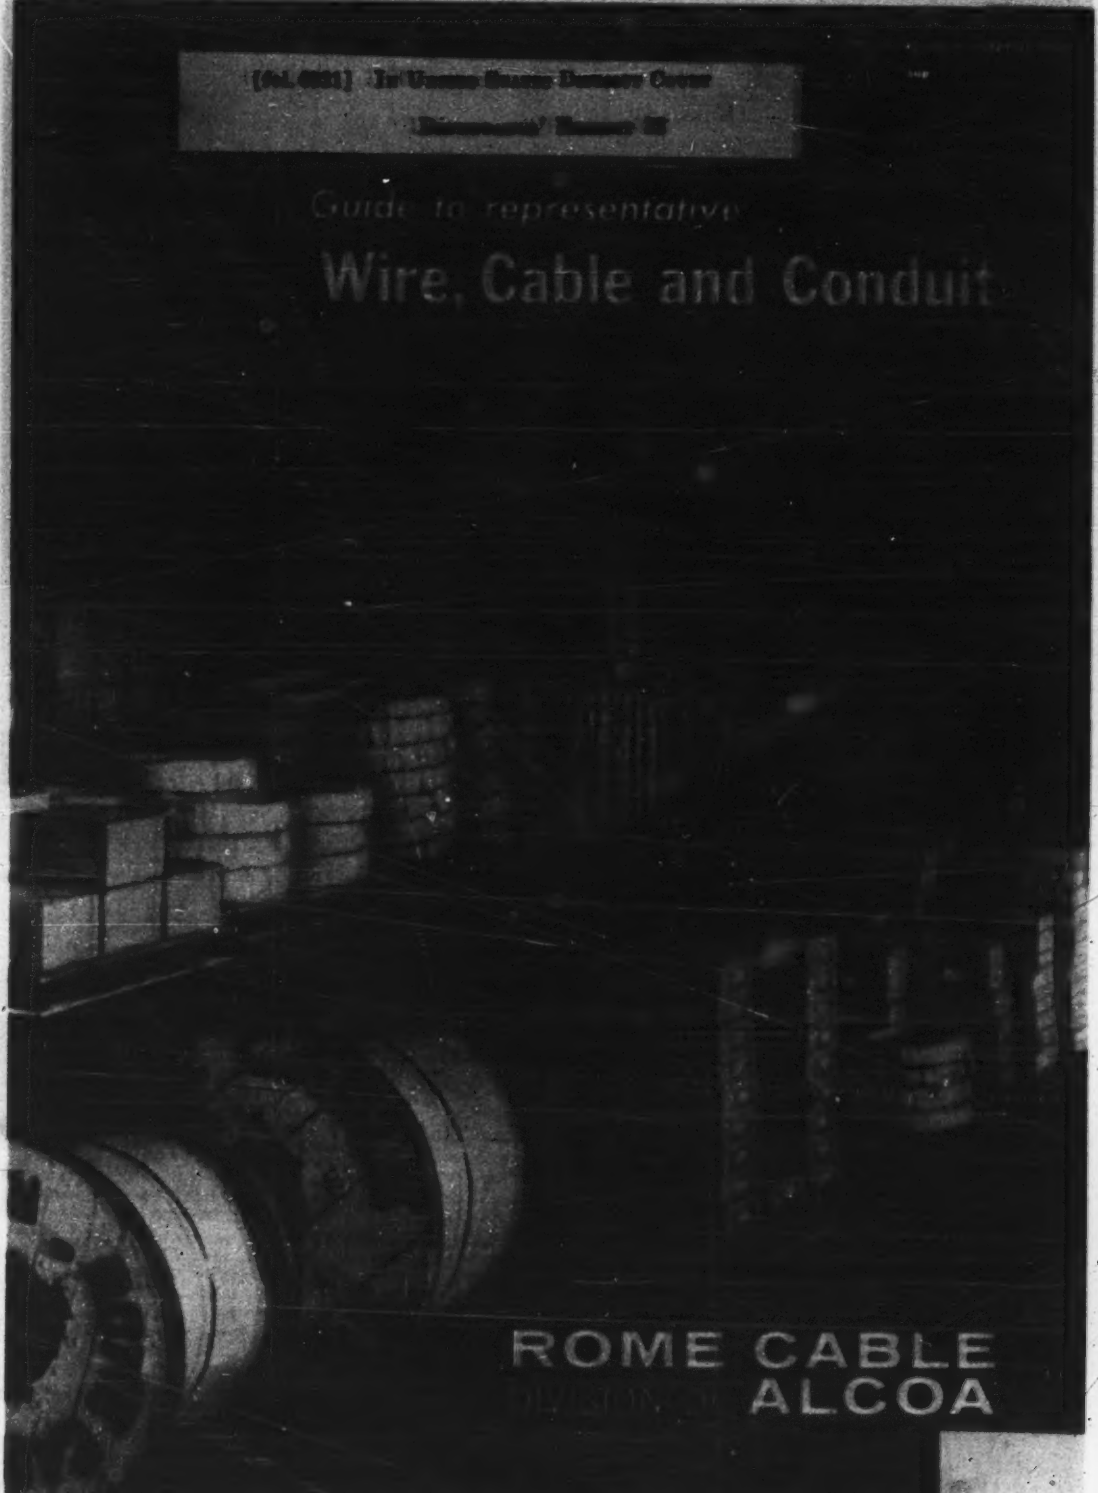
ROME CABLE
CORPORATION

[illegible]

Guide to representative

Wire, Cable and Conduit



ROME CABLE
ALCOA

[fol. 6532]

Bare and Weatherproof Wire

Bare copper wire, aluminum, or ACSR in all tempers—sizes up to 1500 MCM.

Weatherproof wire—Roprene (neoprene), Rolene (polyethylene), or URC types. Conductors may be copper, aluminum, or ACSR. Roprene and URC types are also available in handy 500-foot coils packed in individual cartons—sizes 14 through 4 AWG soft copper.

Magnet Wire

Round, square, and rectangular with insulations of cotton, paper, glass, dacron and glass, silicone-treated glass and high-temperature enamel.

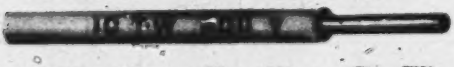
Building Wire

Rubber and Braided or Neoprene Jacketed — 600 volts, Type RHW, for wet or dry installations—75 C.

Rubber and Braided or Neoprene Jacketed — 600 volts, Type RHH for dry installations—90 C.

Thermoplastic Insulated — 600 volts, Type THW, for wet or dry installations—75 C.

All types are available with solid or stranded, copper or aluminum conductors, in the complete range of standard sizes.



Thermoplastic Building Wire—600 volts. Type TW. Rome Synthinol, a polyvinyl chloride thermoplastic used on building wire, is approved by U/L for use in wet or dry locations at 60 C. It is highly resistant to heat, sunlight, oils, acids, alkalies, moisture, and flame.

Synthinol 901 is a special PVC compound developed specifically for wiring in Chemical Plants, Oil Refineries, Paper Mills, and other industrial "hot spots" where additional resistance to heat, oil, and chemical hazards is needed.

- U/L approved as Type TW for 60 C under the National Electrical Code
- U/L approved as appliance lead wire for 600 volts at 105 C on sizes 28 through 8 AWG and at 90 C on sizes 6 through 4/0 AWG.
- Conforms to standards of the National Machine Tool Builders Association for machine tool wire.

Nonmetallic Sheathed Cable — 600 volts. Rome Rolen—Type NM. Two and three conductors, with or without ground, insulated with a high-quality Synthinol thermoplastic compound, covered with an over-all braid and an improved nonflaking finish. Sizes 14 through 4 AWG. U/L approved.

Multipurpose Nonmetallic Sheathed Cable — 600 volts. Rome FlexAll—Types UF and NMC. Approved by Underwriters as underground feeder and branch circuit cable, and nonmetallic sheathed cable — corrosive-resistant. Rome FlexAll is particularly recommended for between-building wiring in farm, industrial, and residential yard lighting and interior wiring of livestock buildings, dairies, breweries, packing houses, cold storage, and ice plants.

Rome FlexAll, single conductor, comes in sizes 14 through 4/0 AWG. Two- and three-conductor FlexAll is made in sizes 14 through 10 AWG and is available with or without ground wire.

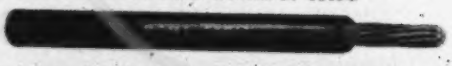
Service Cables

Service Entrance Cable—600 volts. Type SE, Style U. Rome Type SE, Style U, Service Entrance Cables are designed for long life and neat appearance. Specifically recognized by the NEC for attachment to the side of the building from the weather-head to the meter equipment, Rome Type SE cable may also be used from the pole to the meter as well as from the meter to the electric range, clothes dryer, and water heater. U/L approved for 75 C in wet or dry locations, with aluminum or copper conductors.

Self-Supporting Service Drop and Secondary Cable. Embodies the time-proven construction of insulated power conductors spiraled around a bare neutral for mechanical support. Power conductors are Roprene (neoprene) or Rolene (polyethylene) insulated. Power conductors and neutral messengers may be copper, aluminum, or ACSR. Copperweld neutrals are also available. Rome Cable manufactures a special self-supporting cable for overhead distribution where tree conditions are a problem.

[fol. 6523]

Machine Tool and Control Wire



A wire insulated with Rome Synthinol, designed for the wiring of automatic machine tools and control circuits. This product has superior characteristics of long life, high resistance to heat, oils, chemicals, and solvents and uniformly small diameters for more room in tight places. Available in sizes 18 AWG through 4/0 AWG with thermoplastic insulation of clear permanent colors. Rome Synthinol Machine Tool Wire is U/L approved for use at 80 C where exposed to oil; and 90 C on switchboards and in appliances where exposed to air. Conforms to National Machine Tool Builders Association Standards. Voltage rating, 600 volts.

Hook-up Wires

Rome Cable manufactures a broad line of hook-up and appliance wires with both rubber and thermoplastic insulations in a wide range of sizes for commercial and military uses. Outer coverings are available in the form of a transparent nylon sheath or treated braids of cotton, rayon, nylon, or glass.

Power Cables

For aerial, duct, raceway, or direct-in-earth installation.

Romarine-Roprene. This combination of conductor, heat- and moisture-resistant rubber insulation, and neoprene sheath is a multipurpose power distribution and service entrance cable—generally recommended for 600-volt service. Romarine-Roprene may be installed aerially, on open racks, in ducts, or by direct earth burial. U/L approved as Type USE.

Ozone-resistant Cables for High Voltage. Rozone (oil-base) and Rozone A (butyl-base) are both recommended for high-voltage applications where stability of electrical characteristics and exceptionally long life are factors. Manufactured for service up to 15 KV, these cables combine superior ozone resistance with the ruggedness of Roseal—a special flame-retarding polyethylene—or a Roprene sheath. Other sheathing materials are also available. Power cables are manufactured in a full range of sizes as single-, two-, or three-conductor, shielded or unshielded in accordance with industry or customer standards.

Mine Power and Industrial Feeder Cable 0-5000 volts. Type MPT. Rome Type MPT Mine Power and Industrial Feeder Cable is a new economical and easy-to-handle, nonmetallic sheathed power cable with included ground wires for mine feeder and industrial service. Insulated with polyethylene and sheathed with Roseal (flameproof polyethylene), it is less expensive, lighter in weight, and smaller in diameter than conventional rubber and neoprene types which are also available.

Interlocked Armor Cable. Rome Interlocked Armor Cable is available in sizes No. 8 AWG to 750 MCM with copper or aluminum conductors in voltage ratings up to 15 KV. The Armor may be aluminum, bronze, or galvanized steel—insulation may be Rozone (oil-base), Rozone A (butyl-base), Romarine (RH-RW), Synthinol, or polyethylene.

Preassembled Aerial Cable. Individually insulated power conductors are cabled together and bound to a bare Copperweld messenger. Rome's standard design for this product utilizes a reverse lay. As the name suggests, the lay of the power conductors is reversed at regular short distances — approximately every five feet. This reversed lay provides built-in slack to facilitate easy mid-span tapping—even when the circuit is "hot."

The installation of this type cable relieves wire congestion on poles, eliminates or greatly reduces tree trimming, and provides continued service during storm hazards.

Portable Cords and Cables

Portable Cords. Rome Cable offers two grades of portable cords. Rome 50 Types SO and SJO cords are synthetic-rubber-insulated and Roprene (neoprene) sheathed for regular service, while premium Rome 60 cord is mold-cured for extra tough service in hazardous locations. Both Rome 50 and Rome 60 cords are U/L approved.

Rome 60 Portable Power Cables. Round Types W and G. Round multiple-conductor Type W cables are

made up with the specified number of flexible, color coded insulated conductors, assembled and protected over all by a reinforced sheath of neoprene.

Type G cables are similar in construction to Type W cables except that grounding conductors are placed in the interstices of the cable assembly. These cables are designed for use as trailing cables where extra flexibility is required. Each length carries the symbol P 105 BM, denoting compliance with Federal and Pennsylvania Bureau of Mines Safety Codes.

Rome 60 Parallel Duplex Mining Machine Cable. Rome 60 BA twin mining machine cable consists of two heat resistant synthetic rubber insulated and braid reinforced conductors laid parallel, spaced by a "web," and sheathed with a rugged neoprene jacket. Flat twin Type W cable without grounding conductor is used on track mounted equipment in ungrounded systems. Flat twin Type G cable with grounding conductor is used for portable and rubber tired equipment where grounding is required. Type G cable is similar in construction to Type W cable except that a braid-covered flexible grounding conductor is located between the two insulated power conductors. These cables are relatively small in diameter, flexible, easy to handle, and offer maximum resistance to physical abuse. The molded neoprene, P 105 BM, denotes compliance with Federal and Pennsylvania Safety Codes.

Street Lighting Cables

Rome Cable offers a variety of street lighting cables for underground or overhead wiring of series and multiple lighting systems. Insulations may be of rubber or thermoplastic compounds protected with economical nonmetallic jackets, shielding, or lead sheath as required.

Pole and Bracket Cable—600 to 10000 volts, Open Circuit. An improved construction, offering small diameter and low cost. Smoothly clean, neat, easy to use. Unaffected by moisture, ozone, and weather. Insulated with Rome Synthanol (polyvinyl chloride) with an over all sheath of Rolene (polyethylene). Recommended for the interior wiring of ornamental poles, cutout wiring of pole top bracket fixtures.

Instrumentation, Station Control, Supervisory and Signal Cables

Instrumentation cables are specially designed and built in a variety of constructions for telemetering and data transmission.

Station Control Cables 600 volts. Rome Cable is a leader in the manufacture of station control and supervisory control cables. Sound engineering, expensive and modern manufacturing facilities enable Rome Cable to produce a variety of constructions. Some typical constructions utilize (1) Rolene insulation with Rolene sheath (Type CRO-1), (2) Romarine insulation with Rolene sheath, (Type CRM-1) and (3) all thermoplastic construction (Type CT-2) (Type CT-B) (Type CT-C).

Signal Cables — IMSA Types, 600 volts. Rome Cable regularly supplies cables in conformance with IMSA Specifications No. 1, 3, 4, 5, 19, and 20. The popular Type 19, Specification No. 5 embodies moisture resistant insulation, (Romarine) and a non metallic sheath (Rolene).

Conduit

Rome EMT Electrical Metallic Tubing. A superior thin wall steel conduit. Solid electrogalvanized zinc exterior finish resists corrosion and abrasion. Mirror smooth interior makes fishing and pulling easy. Underwriters approved.

Alsus Aluminum Conduit offers many advantages such as light weight, low cost, good appearance, corrosion resistance, non sparking, non magnetic, easy installation and is Underwriters approved.

In accordance with our various phone conversations, we advised you that if you could in any way revise the price on the aluminum from $2510.00 M ft. to $2300.00 in the hopes of getting a portion of this business, please do so. You advised that competitive price on this item was around $2000.00. We can not as yet live with this price in view of our costs, but in an effort to get some of this type business from this account we would be willing to take some of it around $2300.00.

If you can find out who is quoting the $2000 price please pass it along to us.

INQUIRY NO. BC-1383

FROM: Boston Office DISTRICT DATE: Jan. 5, 1953

TO: CENTRAL QUOTATION DEPT., ROME, N.Y.

INQUIRY FROM: Boston Edison Co., Boston, Mass.

FOR SHIPMENT TO:

— THE FOLLOWING MATERIAL —

With reference to the attached, please quote the following construction and estimating prices:

Item 1 - 2000 ft. - 3 Condrs. #4/0 - 19 strand bare, semi-conducting tape, .220" ntrual polyethylene, bedding and shielding tapes, 6/64" KoSeal sheath; three such conductors twisted with reverse lay and bound to a 1/2" 30% EHS copperweld messenger by means of a .030" x .375" bare soft copper binding strap, putup 1000 ft. on 84" reels.
Recommended maximum span - 175 ft.
Stringing sag @ 60F - 32"
Ampacity - 285 amperes @ 75C copper temperature and 40C ambient.
O.D. 3.319" x 2.833" @ - - - - - -$3918.00 M ft.

Item 1A 2000 ft. - Ditto above except 336,400 C.M. - 19 strand ECH 26 aluminum conductor, putup 700 ft. on 84" reels.
Recommended maximum span - 200 ft.
Stringing sag @ 60F - 34"
Ampacity - 285 amperes @ 75C conductor temperature and 40C ambient.
O.D. 3.663" x 3.177" @ - - - - -$4185.00 M ft.

Item 1B 6000 ft. - Single Condr. #4/0 - 19 strand bare, semi-conducting tape, .220" natural polyethylene, bedding and shielding tapes, 6/64" KoSeal sheath, putup 2500 ft. on 72" reels @ - -$1150.00 M ft.

Item 1C 6000 ft. - S.C. Ditto Item 1B except 336,400 C.M. - 19 strand ECH 26 aluminum conductor, putup 2500 ft. on 72" reels @ - $1235.00 M ft.

1958	4,388,500	1,257,386	29	1,596,500	554,776	35
1959	4,805,500	899,150	19	1,596,500	342,915	21
1960	4,937,500	908,506	18	1,706,500	252,530	15

Quantities are thousands of pounds.

Note: The above tabulation shows that Alcoa production exceeded Alcoa capacity in the years 1951, 1953 and 1954. This results from capacity having been based on median water conditions and assumed no purchase of high cost power. High cost power was actually used during the year 1951, and better than median water conditions existed in 1953 and 1954 resulting in Alcoa production exceeding Alcoa capacity. As a result of Alcoa production exceeding Alcoa capacity in 1954, total U.S. production exceeded total U.S. capacity in that year.

(1) Prior to 1/27/50 there was no transportation allowance on cable, therefore, $.0135 per composite pound has been added to the price schedule indicated to adjust for the present full transportation allowance basis.

(2) These are the exact dates of the cable price changes. In some cases the pig and redraw price changes vary from these dates by a few days.

(3) The spread between redraw and cable is based on the difference between the redraw price and the arithmetic average of the cable prices shown above.

Source of Data - Above prices taken or calculated from yellow price data sheets.

(4) 7-22-46 to 2-27-56 - 99% Minimum Average Pig
2-28-56 to 7-31-60 - E.C. Alloy Pig
8-1-60 to date - E.C. Alloy Ingot

(2) The sum of "Insulated or Covered Wire and Cable" and "ACSR and Bare Cables" item from the U.S. Department of Commerce, BDSA, Aluminum and Magnesium Division reports entitled "Gross Shipments of Aluminum Mill Shapes by Integrated and Non-Integrated Producers" for the period in question.

(3) The sum of the following:

(a) "Integrated Producers" shipments taken from reports in note (2) above, increased by addition of shipments of merged companies for years prior to merger, obtained from documents and answers supplied by Plaintiff in answer to Defendants' Interrogatories and Document Production; and

(b) "Primary Producers or Affiliates" shipments of "Insulated or Covered Wire and Cables" reported in the U.S .Department of Commerce, BDSA, Aluminum and Magnesuim Division report dated November 8, 1961, entitled "Shipments of Wire by Primary Producers or Affiliates (Including Merged Companies) and Other Producers, 1954–1960."

(4) The sum of the following:

(a) "Non-Integrated Producers" shipments, taken from reports in note (2) above, decreased by subtracting shipments of merged companies for years prior to merger, obtained from documents and answers supplied by Plaintiff in answer to Defendants' Interrogatories and Document Production; and

(b) "Other Producers" shipments of "Insulated or Covered Wire and Cable" reported in the U.S. Department or Commerce, BDSA, Aluminum and Magnesium Division report dated November 8, 1961, entitled "Shipments of Wire by Primary Producers or Affiliates (Including Merged Companies) and Other Producers, 1954–1960."

(5) Shipments reported by Alcoa and Rome to U.S. Department of Commerce on Form BDSAF–122 during the period in question.

THE ALUMINUM ASSOCIATION
420 LEXINGTON AVENUE
NEW YORK 17, NEW YORK

Revised: May 1, 1961
Supersedes: November 15, 1960

Footnotes to Table of Chemical Composition Limits on Pages 1 and 2

(1) Composition in percent maximum unless shown as a range, a minimum or a nominal value.

Standard limits for alloying elements and impurities are expressed to the following places:

Less than 1/1000 percent	.0.000X
1/1000 to 1/100 percent	.0.00X
1/100 to 1/10 percent	
Unalloyed aluminum made by a refining process	.0.0XX
Alloys and unalloyed aluminum not made by a refining process	.0.0X
1/10 through 1/2 percent	.0.XX
Over 1/2 percent	.0.X, X.X, etc.

(2) For purposes of determining conformance to these limits, an observed value or a calculated value obtained from analysis is rounded off to the nearest unit in the last right-hand place of figures used in expressing the specified limit, in accordance with the following:

American Standard Rules for Rounding Off Numerical Values (ASA Z25.1)

When the figure next beyond the last figure or place to be retained is less than 5, the figure in the last place retained should be kept unchanged.

When the figure next beyond the last figure or place to be retained is greater than 5, the figure in the last place retained should be increased by 1.

When the figure next beyond the last figure or place to be retained is 5 and

(a) there are no figures, or only zeros, beyond this 5, if the figure in the last place to be retained is odd, it should be increased by 1; if even, it should be kept unchanged.

(b) if the 5 next beyond the figure in the last place to be retained is followed by any figures other than zero, the figure in the last place retained should be increased by 1, whether odd or even.

(3) Analysis is regularly made only for the elements for which specific limits are shown, except for unalloyed aluminum. If, however, the presence of other elements is suspected, or indicated in the course of routine analysis, further analysis is made to determine that these other elements are not in excess of the amount specified.

(4) The aluminum content for unalloyed aluminum made by a refining process is the difference between 100.000 percent and the sum of all other metallic elements present in amounts of 0.001 percent or more each, expressed to the third decimal.

(5) The aluminum content for unalloyed aluminum not made by a refining process is the difference between 100.00 percent and the sum of all other metallic elements present in amounts of 0.010 percent or more each, expressed to the second decimal.

(6) Electric conductor

(7) Reflector sheet.

(8) Foil.

(9) Cladding on clad 1100 and clad 3003 reflector sheet.

(10) Capacitor alloy.

(11) Cladding on alclad 2024.

(12) Silicon, max., 50 percent of iron.

(13) Bismuth, lead, tin, 0.01 max. each; lithium, 0.008 max.; cadmium, 0.003 max.; boron, cobalt 0.001 max. each.

(14) Titanium plus vanadium, 0.02 max.

(15) Silicon plus iron, 0.14 max.

(16) Lead, bismuth, 0.20-0.6 each.

(17) Vanadium, 0.05-0.15; zirconium, 0.10-0.25.

(18) Nominal percentage.

(19) Brazing alloy.

(20) Bus conductor.

(21) Cladding on alclad 2014.

(22) Silicon, 45-65 percent of magnesium.

(23) Boron, 0.06 max.

(24) Boron, cobalt, 0.001 max. each; cadmium, 0.003 max.; lithium, 0.008 max.

(25) Tin, 5.5-7.0.

(26) Beryllium 0.0008 maximum for welding electrode and filler wire only.

(27) Welding electrode

(28) Mechanical wire.

(29) Gallium 0.02 max.

(30) Cadmium 0.10-0.35; lithium 0.9-1.7.

(31) Cladding on alclad 5056.

(32) Cladding on alclad 3003, alclad 3004, alclad 5050, alclad 5155, alclad 6061, alclad 7075, and alclad 7178.

(33) Total copper + manganese + magnesium at least 0.7.

(34) Lead 0.30 max.

(35) Tin 0.005 max; sodium 0.005 max.

(36) Conductor alloy.

(37) Lead, bismuth 0.40-0.7 each.

Clad 3003 reflector sheet	3003	1175	Under 0.065 0.065 and over	One or Both	15 7 1/2

① Cladding composition is applicable only to the aluminum or aluminum alloy which is bonded to the alloy ingot or slab preparatory to rolling to the specified composite product. (The composition of the cladding may be subsequently altered by diffusion between the core and cladding due to thermal treatment.)

② Average minimum thickness of cladding of sheet and plate after rolling to the specified thickness of the composite product will be 80 percent of the nominal as determined by averaging cladding thickness measurements taken at a magnification of 100 diameters on the cross section of samples polished and etched for microscopic examination.

③ Nominal cladding thickness of 4 percent is now obsolete for alclad 7075 sheet and plate in these thickness ranges and is shown for information only.

④ Alclad 2024 sheet and plate in thicknesses of 0.1 inch and over are furnished with a nominal cladding thickness of 2 1/2 percent unless the thinner cladd is specifically designated.

⑤ For thicknesses of 0.500 inch and over with 1 1/2 percent nominal cladding thickness, the average mini mum thickness of cladding after rolling to the specified thickness of composite plate will be 3 percent the composite thickness, as determined by averaging cladding thickness measurements taken at a magnifica tion of 100 diameters on the cross section of sample polished and etched for microscopic examination.

For Immediate Release
Tuesday, April 11, 1961

Primary Aluminum Output Gains Strongly

Primary aluminum production in the United States went from 1.4 billion pounds in 1950 to 4 billion pounds in 1960, an increase of 180 percent, while the number of producing companise doubled—3 to 6—in the same period, the Aluminum and Magnesium Division, Business and Defense Services Administration, U.S. Department of Commerce, reported today.

Detailing industry operations over the decade, the Division said that the greatest growth was in companies producing extruded shapes and drawn tube, whose number went from 39 in 1950 to 133 in 1960. The 1960 shipments were 921 million pounds, 210 percent above 1950. Foil producers numbered 16 in 1960, compared with 9 in 1950, and 1960 shipments were 252 million pounds, 145 percent above 1950.

Secondary ingot producers, producing ingot from scrap, numbered 84 in 1960 compared with 63 ten years earlier, and shipments increased 82 percent during the period to 652 million pounds.

Although sheet producers grew in number from 9 to 34 in the 10-year period, shipments increased by only about 48 percent to 1.5 billion pounds.

Further details are given in the appended table:

USCOMM-DC-7523

[fol. 6590] Number of Aluminum Producers and Shipments 1950, 1955, 1960

Product	Number of producers			Shipments [1] Millions of pounds			Percent change
	1950 [2]	1955	1960	1950 [2]	1955	1960	1950–1960
Primary metal	3	4	6	1,437	3,131	4,029	+180
Secondary ingot	63	77	84	358	599	652	+ 82
Sheet and plate	9	24	34	1,028	1,466	1,525	+ 48
Foil	9	12	16	103	300	252	+145
Extruded shapes & drawn tube	39	110	133	297	767	921	+210
ACSR (aluminum conductor steel reinforced)	12	12	11	133	157	184	+38
Wire and insulated or covered wire and cable	NA	48	47	NA	103	121	NA
Powder and paste	7	9	9	22	37	33	+ 50
Forgings	NA	45	41	NA	70	50	NA

[1] Primary and secondary ingot figures are production as reported by the Bureau of Mines. Other data are gross shipments as reported by the Bureau of the Census and differ from published net shipments, in that gross shipments include shipments between companies in the industry, while net shipments do not.

[2] Captive plants, i.e. plants producing solely for their own further use, are included in 1955 and 1960 but not in 1950; there were very few in that year.

NA—Not available.

DEFENDANTS' EXHIBIT 71

List of Companies and Plants Producing Copper Wire and Cable

The kind of wire products and type of covering or insulation are indicated by the letter symbols below:

Insulated wire and cable:	
Rubber & thermosetting synthetics	A
Thermoplastic	B
Varnished cambric	C
Asbestos	D
Paper insulated power cable	E
Submarine cables (incl. armored)	F
Telephone cables:	
Pulp and paper insulated	G
Textile insulated	H
Plastic insulated	I
Magnet wire:	
Enameled and synthetic	J
Glass	K
Covered, other than glass	L
Special military items:	
Field wire	M
Spiral 4	N
Floating cable	O
Shipboard cable (armored)	P
Aircraft wire and cable	Q
Other	R
Coaxial types (high frequency only)	S
Tinned and lead alloy (hot dipped) coated wire:	
Round—solid	T
Stranded—all types	U
Weatherproof (Textile covered):	
Solid	V
Stranded	W
Other	X

WIRE AND WIRE PRODUCTS BUYERS' GUIDE

1961 EDITION

AND YEARBOOK OF THE WIRE ASSOCIATION

INTRODUCTION

THE annual WIRE AND WIRE PRODUCTS BUYERS' GUIDE AND YEAR BOOK OF THE WIRE ASSOCIATION, of which this is the thirty fourth edition, aims to present complete and comprehensive lists of manufacturers of bare and covered wire, of fabricators of wire, and of supplies and equipment used by both.

This edition has been greatly improved and has combined with it the thirtieth YEAR BOOK OF THE WIRE ASSOCIATION.

Lists were made up as the result of direct circularization of the industries represented. As in any annual reference work, a certain percentage of errors and omissions are unavoidable, but every effort has been made to keep these down to a negligible minimum up to the time of going to press.

In this connection, users of the book are asked to remember the willingness of the publishers to supplement the information contained in this directory with prompt acknowledgment of any inquiries for information about sources of supply for wire, wire products, and the machinery, supplies and equipment entailed in their manufacture.

The BUYERS' GUIDE is not only a guide to products and manufacturers but also a subject matter index to the 1960 volume of WIRE AND WIRE PRODUCTS, the only publication serving this industry.

In communicating with any firm herein listed you will confer a favor on both the publisher and manufacturer by referring to the fact that the name or information was found in this BUYERS' GUIDE.

The price of the BUYERS' GUIDE is $5.00 per copy. Subscribers to WIRE AND WIRE PRODUCTS receive a 40% discount. Members of THE WIRE ASSOCIATION receive a copy without additional cost.

The Publishers.

Price $2.50

[fol. 6617] Introduction

The Standard Industrial Classification

Purpose of the Classification

The Standard Industrial Classification was developed for use in the classification of establishments by type of activity in which engaged; for purposes of facilitating the collection, tabulation, presentation, and analysis of data relating to establishments; and for promoting uniformity and comparability in the presentation of statistical data collected by various agencies of the United States Government, State agencies, trade associations, and private research organizations.

Scope of the Classification

The Classification is intended to cover the entire field of economic activities: agriculture, forestry, and fisheries; mining; construction; manufacturing; transportation, communication, electric, gas, and sanitary services; wholesale and retail trade; finance, insurance, and real estate; services; and government.

This Manual presents a revision of the 1945 edition of Manufacturing Industries and the 1949 edition of Nonmanufacturing Industries. In this revision a number of changes suggested by users of the classification and by consumers of industry data have been incorporated. Among the more important changes in the Classification are: (1) separate Major Groups for commercial and noncommercial farms; (2) the transfer of milk pasteurization plants; ready mixed concrete establishments; and apparel, knitting and leather jobbers or converters from trade to manufacturing; (3) a rearrangement of local transportation companies; (4) the transfer of radio and television broadcasting from services to a new Major Group covering communication facilities; and (5) a more detailed classification of government.

The format of the Manual also represents a change from previous editions. The separate volumes for manufacturing and nonmanufacturing industries have been eliminated by consolidating into a single volume the industry

titles and descriptions, as well as the alphabetic index of principal products, processes, and services.

Principles of the Classification

The Classification was prepared by the Technical Committee on Standard Industrial Classification, assisted by a number of special committees of experts in various fields of business. The work of the Technical Committee was carried on under the sponsorship and general supervision [fol. 6618] of the Office of Statistical Standards of the Bureau of the Budget, Executive Office of the President.

In preparing the Classification, the Technical Committee was guided by the following general principles:

(1) The Classification should conform to the existing structure of American industry.

(2) The reporting units to be classified are establishments, rather than legal entities or companies.

(3) Each establishment is to be classified according to its major activity.

(4) To be recognized as an industry, each group of establishments must have significance from the standpoint of the number of persons employed, volume of business, and other important economic features, such as the number of establishments.[1] The procedure followed as a guide in measuring the economic significance of manufacturing industries is outlined in the Appendix, page 429.

Definition of Establishment

An "establishment" is an economic unit which produces goods or services—for example, a farm, a mine, a factory, a store. In most instances, the establishment is at a single physical location; and it is engaged in only one, or predominately one, type of economic activity for which an industry code is applicable.

Where a single physical location encompasses two or

[1] An exception to this principle is found in the grouping of establishments into industries described as "not elsewhere classified."

more distinct and separate economic activities for which different industrial classification codes seem applicable, such activities should be treated as separate establishments and classified in separate industries, provided it is determined that: (1) such activities are not ordinarily associated with one another at common physical locations; (2) no one industry description in the Standard Industrial Classification includes such combined activities; (3) the employment in each such economic activity is significant;[2] and (4) reports can be prepared on the number of employees, their wages and salaries, and other establishment type data. An establishment is not necessarily identical with the business concern or firm, which may consist of one or more establishments. Also, it is to be distinguished from organizational subunits, departments, or divisions within an establishment. Supplemental interpretations of the definition of an establishment are included in the industry descriptions of the Standard Industrial Classification.

[fol. 6619] Auxiliary Units

In applying the Standard Industrial Classification to individual establishments, instances will be encountered where the activity of an establishment under consideration may have some, but not all, of the characteristics of individual industries as provided in this Manual. The activities of these establishments are subordinate to, and operated for the use of, some other establishment(s) of the same concern and are generally at locations separate from the establishment(s) served. Such establishments are called "auxiliary units." The more important types of such auxiliary units are illustrated below.

1. A separate research laboratory operated for manufacturing plants of the same concern.
2. A warehouse operated by another establishment primarily for its own use and not for public storage is auxiliary to the establishment for which it is op-

[2] Usually 100 or more employees in mining or manufacturing activity, and 50 or more employees in activities other than mining or manufacturing.

erated. Thus, warehouses may be auxiliary to manufacturing, wholesaling, or retailing operations.

3. An automotive repair shop or storage garage operated by a department store primarily for its own use and not for the public repair or storage of vehicles.
4. A separate repair shop serving various manufacturing plants of the same concern primarily for the maintenance and repair of plant machinery and equipment.

Mines and manufacturing plants operated primarily for the use of other establishments of the same firm are not considered auxiliary units, but are classified on the basis of their primary activity. Important types are:

1. A coal mine operated by a steel company for its own use is classified as a coal mine.
2. A tin can manufacturing plant operated by a canning company for its own use is classified as a tin can manufacturing plant.
3. A printing plant operated primarily for the use of another establishment(s) of the same company is classified as a printing plant.

Central and District Administrative Offices

A central or district administrative office is an establishment primarily engaged in general administrative, supervisory, purchasing, accounting and other management functions performed centrally for other establishments of the same company.

Industrial Classification of Auxiliary Units and Central and District Administrative Offices

Auxiliary units and central and district administrative offices, when separately reported, should be classified on the basis of the most appropriate Major Group representing the primary activity of the establishments served. All such units will be assigned a four digit code, the first two digits being the appropriate Major Group code (01 through 89); the third digit a zero code and the fourth digit to identify

[fol. 6620] the type of unit. The fourth digit code numbers for general use are as follows:

1—Central or district administrative offices
2—Research laboratories
3—Warehouses
9—Other auxiliary units

Thus, a central or district administrative office serving establishments primarily engaged in activities classified in Major Group 33.—Primary Metal Industries—would be 3301; a warehouse serving establishments primarily engaged in activities classified in Major Group 54.—Retail Trade—Food—would be 5403.

Agencies desiring to distinguish additional types of auxiliary units, other than those listed above, will so advise the Chairman of the Technical Committee on Standard Industrial Classification, Office of Statistical Standards, Bureau of the Budget, to assure comparability among agencies.

Basis of Establishment Classification—Code Assignment

Each establishment is assigned an industry code on the basis of its major activity, which is determined by the product or group of products produced or handled, or services rendered. Ideally, the principal product or service should be determined by reference to "value added." In practice, however, it is rarely possible to obtain this information for individual products or services, and it becomes necessary to adopt some other criteria which may be expected to give approximately the same results. It is recommended, therefore, that, as far as possible, the following characteristics be used for each of the major economic sections:

Economic Section	Characteristics
Agriculture, forestry, and fisheries (except agricultural services)	Value of production.
Mining	Value of production.
Construction	Value of work done.
Manufacturing	Value of production.
Wholesale and retail trade	Value of sales.

Economic Section	Characteristics
Finance, insurance, and real estate	Value of receipts.
Services (including agricultural services)	Value of receipts.
Government	Function.

Occasionally in cases of mixed businesses, the above characteristics cannot be determined or estimated for each product or service, and less frequently a classification based upon the recommended characteristics will not represent adequately the process or activity of the establishment. In such cases, if employment information is available, the major activity should be determined by the activity in which the greatest number of employees worked.

[fol. 6621] Structure of Classification

The structure of the Classification makes it possible to classify establishments by industry on either a two digit, a three digit, or a four digit basis, according to the degree of detail in information which may be needed. It permits an agency to select the level of detail considered most appropriate for presentation of its data. Also, it permits an agency to use additional subdivisions in adopting this Classification for its own use, while still retaining comparability with the classifications used by other agencies. Furthermore, comparability with the Classification may be maintained on a two digit basis by combining groups or industries within a Major Group; similarly, comparability may be maintained on a three digit basis by combining industries within a three digit group. All groupings or industry subdivisions should be clearly labeled.

Some agencies may wish to use the numbering system of the Classification; but other agencies will, no doubt, find it more convenient to adapt their present numbering system to this Classification.

Agencies which use the three digit code may use a zero temporarily on the third digit position for coding reports on which available information is inadequate for proper allocation to a specific three digit group. For example,

Major Group 25.—Furniture and Fixtures—is divided into the following groups:

251 Household Furniture
252 Office Furniture
253 Public Building and Related Furniture
254 Partitions, Shelving, Lockers, and Office and Store Fixtures
259 Miscellaneous Furniture and Fixtures

If an establishment is described as engaged in manufacturing furniture, the report should be coded as "250" until sufficient information is obtained to assign the establishment to the appropriate group.

An agency which uses the four digit code may use a zero temporarily, in the fourth position, to code reports for which the information available is inadequate for proper allocation to a specific industry.

It will be noted that whenever number nine has been used on the third or fourth digit position, it has been assigned to miscellaneous three digit groups or four digit industries covering establishments not elsewhere classified. The establishments grouped at the four digit level as "not elsewhere classified" may not constitute homogeneous groups but are treated as separate industries for purposes of this Classification.

Acknowledgments

In the preparation of this revised edition of the Standard Industrial Classification Manual, the Technical Committee wishes to acknowledge the valuable assistance received from the Advisory Council on Federal Reports, of which Mr. Merrill A. Watson, National Shoe Manufacturers Association, is Chairman. The review of the Manual by [fol. 6622] the Advisory Council was carried out under the general guidance of a Coordinating Committee consisting of:

P. K. Lawrence, E. I. duPont deNemours and Company, Chairman
Preston B. Bergin, National Association of Blueprint and Diazotype Coaters

A. J. Nesti, National Electrical Manufacturers Association
John H. Seaton, Pennsylvania Manufacturers Association
Earl L. Knight, Pennsylvania Manufacturers Association (alternate for Mr. Seaton)
Horace Stringfield, Iron and Steel Institute
J. V. Henlock, United States Steel Corporation (alternate for Mr. Stringfield)

Consultants

R. Buford Brandis, American Cotton Manufacturers Association
C. F. Graf, Jr., International Business Machines Corporation

Mr. Russell Schneider, Executive Secretary of the Advisory Council, was particularly helpful in the establishment of committees of industry representatives to review specific sections of the Manual. Twenty-six committees were established, each of which made many valuable suggestions on the Classification. The Technical Committee also wishes to express appreciation for many constructive criticisms and suggestions received from the American Marketing Association, Dun and Bradstreet, McGraw-Hill Publishing Company, the National Bureau of Economic Research, various trade unions, trade associations, and Federal and States agencies.

[fol. 6623]

Group No.	Industry No.	
334		Secondary Smelting and Refining of Nonferrous Metals and Alloys
	3341	Secondary smelting, refining, and alloying of nonferrous metals and alloys
		Establishments primarily engaged in recovering nonferrous metals and alloys from new and used scrap and dross, but which are not engaged in further fabrication. This industry includes establishments engaged in both the recovery and alloying of precious metals. Plants engaged in the recovery of tin through

Group No. Industry No.

secondary smelting and refining, as well as by chemical processes are included in this industry. Establishments primarily engaged in assembling, sorting, and breaking up scrap metal, without smelting and refining are classified in trade industries.

335 Rolling, Drawing and Extruding of Nonferrous Metals

3351 Rolling, drawing, and extruding of copper

Establishments primarily engaged in rolling, drawing, and extruding copper, brass, bronze, and other copper base alloy basic shapes, such as plate, sheet, strip, bar, and tubing. Establishments primarily engaged in recovering copper and its alloys from scrap or dross are classified in Industry 3341.

3352 Rolling, drawing, and extruding of aluminum

Establishments primarily engaged in rolling, drawing, and extruding aluminum and aluminum base alloy basic shapes, such as plate, sheet, strip, bar, tubing, and foil.

3356 Rolling, drawing, and extruding of nonferrous metals, except copper and aluminum

Establishments primarily engaged in rolling, drawing, and extruding nonferrous metals other than copper (Industry 3351), and aluminum (Industry 3352). The products of this industry are produced in the form of basic shapes, such as plate, sheet, strip, bar, and tubing. Establishments primarily engaged in recovering nonferrous metals and alloys from scrap or dross are classified in Industry 3341; in manufacturing gold, silver, tin, and other foils except aluminum in Industry 3497; and aluminum foil in Industry 3352.

3357 Drawing and insulating of nonferrous wire

Establishments primarily engaged in drawing, drawing and insulating, and insulating wire and cable of nonferrous metals from purchased wire bars, rods, or wire.

Group No.	Industry No.	
336		Nonferrous Foundries

This group includes establishments primarily engaged in manufacturing castings and die castings of aluminum, brass, bronze and other nonferrous metals and alloys. These establishments generally operate on a job or order basis manufacturing castings for sale to others or for interplant transfer. Establishments which produce nonferrous castings and which are also engaged in fabricating operations such as machining, assembling, etc., in manufacturing a specified product are classified in the industry of the specified product. Nonferrous castings are made to a considerable extent by establishments classified in other industries that operate foundry departments for the production of castings for incorporation, in the same establishment, into such products as machinery, motor vehicles, etc. Establishments primarily engaged in manufacturing iron and steel castings are classified in Group 332.

[fol. 6624] Appendix

Criteria for Recognizing Manufacturing Industries in the Standard Industrial Classification

General Comments:

The Standard Industrial Classification defines industries in accordance with the existing structure of the American economy. An industry is a grouping of establishments primarily engaged in the same or similar lines of economic activity. In the manufacturing division, the line of activity is generally defined in terms of the product made, materials consumed, or process of manufacture used.

Sometimes a common process of manufacture may result in an industry of considerable size and a wide variety of products; e.g., meat packing, and blast furnaces, steel works and rolling mills. In other instances, the production of an industry may be limited to a single product, such as chewing gum or wallpaper. To be recognized as an industry each group of establishments must have significance from the standpoint of number of production workers, value added by manufacture, value of shipments, and number of establishments. Size of an industry is not the sole criterion for its recognition; it is also important that an industry comprise a group of establishments of which the output of products or processes defining the industry (primary products of the industry) account for a relatively high proportion of (a) the total shipments or receipts of the industry (specialization ratio), and (b) the total output by all industries of the products or processes which are primary to the industry (coverage ratio).

The quantitiative standards for size, specialization and coverage for manufacturing industries that have been established are described in subsequent paragraphs. There may be a few instances where other important considerations will warrant the establishment or retention of an industry which does not satisfy size, specialization and coverage criteria.

As a result of the application of these criteria, there will be "leftover" segments of American industry. Lines of business activity which do not satisfy the criteria for

the recognition of an industry, if they are very closely associated with the activities of another industry, may be included with that industry. This may have the effect of reducing the specialization ratio of the industry with which this line of activity is combined, but such a procedure may be preferable to including the line of activity in a "miscellaneous" or "not elsewhere classified" category for that particular three digit group. Each case must be evaluated on its own merits. It may be better to allow a small element of impurity to be introduced into a [fol. 6625] given four digit industry by associating it with line of activity which is quite closely related rather than to increase the size of the "miscellaneous" category for the three digit group by adding another line of activity, since the "miscellaneous" categories are heterogeneous and are primary to the industry (coverage ratio).

Standards for Criteria:

As a result of the Census of Manufactures, data (number of establishments, employment, value added, etc.) are available for manufacturing as a whole. Knowing the number of industries, values for each desired item have been calculated for an "average" industry. These values for the "average" industry were used as the basis for measuring size. For each desired item, a number of points were awarded an industry, depending on the industry's relationship to the size of the "average" industry. The points awarded were equal to the percent of the "average" industry. The points for the various items were averaged with a system of weights to secure the final score for an industry. The score determines whether the industry is to be considered sizable or not.

Size Criteria:

Size was measured by a comparison of four items as follows:

1. Number of employees
2. Value added by manufacture
3. Value of shipments
4. Number of establishments

Number of employees and value added are recognized as being more significant and reliable measures of industry size than are value of shipments and number of establishments. Value of shipments includes the value created in other industreis or other economic divisions such as Agriculture, etc., and does not measure value of income produced in the specific manufacturing industry. In some instances, the large duplication of value of shipments within an industry makes publication of the figure meaningless. A count of establishments in each industry is of limited significance as it treats both large and small establishments as of equal importance. In addition, the derivation of an "average" number of establishments per industry reflects, to a large extent, the very numerous plants in a relatively few industries. For example, five industries (Bakeries, Sawmills, Newspapers, Commercial Printing, and Concrete Products) account for approximately 22 percent of the number of establishments, but only 8 percent of the number of employees and value added by manufacture.

Generally speaking, an existing Standard Industrial Classification industry is considered as sizable if it attains a point score of 10 or higher. The point score for a new industry is 20 or higher. In deriving the final score based on the four items included in the determination, double weight is given to the "number of employees" and to "value added." The final score is a measure in percent of the size of an industry in relation to an "average" industry.

[fol. 6626] Industries should not be eliminated because they fail to attain the recommended size scores, without giving due attention to the comments contained in the section dealing with the application of criteria.

Specialization Ratio and Coverage Criteria:

The minimum ratio for industry specialization is 80. When applying the specialization test, it is well to remember that an industry may sometimes specialize in only one product (malt or beet sugar). In other instances, establishments in an industry may typically produce and thus specialize in a wide variety of products (Meat Packing

Plants; Blast Furnaces, Steel Works, and Rolling Mills; and Radio and Television Transmitting, Signalling, and Detection Equipment and Apparatus). For varying reasons, industries have through the years developed in a diverse manner. It is important, therefore, that the specialization ratios not be applied rigidly, but that they be interpreted in the light of the nature of the particular industry.

In applying coverage ratio factors, separate criteria are established for industries with "captive" output within and outside the industry as distinguished from industries primarily producing for commercial sale. The minimum coverage ratio for industries described in the Standard Industrial Classification as producing for commercial sale is 70; the coverage ratio for all other industries is 50, except for industries producing from purchased materials (stage of process classification). The minimum coverage ratio for this latter group of industries (Blended and Prepared Flour, etc.) is 33. The coverage ratio for industries with significant "captive" counterparts (minimum coverage of 50 percent) should be computed on the basis of the proportion of total output accounted for by the given industry (shipments for sale, interplant transfer, and production for use within the same establishment) compared with total output in all industries (shipments for sale, interplant transfer, as well as production for use within the same establishment). Examples of such industries are Gray Iron Foundries, Metal Stampings, and Iron and Steel Forgings.

Application of Criteria:

The application of the size, specialization and coverage criteria to a particular industry is subject to other considerations. Industries which appear to qualify because of special or unique factors not included in the formula described above may be retained. Examples of such factors are defense mobilization; very large industries with specialization slightly below 80 percent; and industries of special significance in economic fluctuations which are also near the lower specialization limit, such as Machine Tools.

Separate industries for plants in an area that is

rapidly expanding but which does not meet the quantitative measures in the usual reference statistics also may be retained. Such retention is based on substantial statistical evidence of current size, or conclusive evidence of growth by a specified time, and on the industries meeting the customary requirements, other than size, for establishing an industry.

Mineral Industry Surveys

United States Department of the Interior, Bureau of Mines

Stewart L. Udall, Secretary
Marling J. Ankeny, Director

Mineral Market Report
Mineral Market Survey No. 3349

Aluminum and Bauxite in 1961
(Preliminary Annual Data)

Aluminum: Domestic primary aluminum production in 1961 was approximately 1,880,000 short tons, a drop of 6 percent from the record year of 1960, according to the Bureau of Mines, U.S. Department of the Interior. Shipments of primary metal ingot increased slightly during 1961 in comparison to 1960, and exceeded the quantity produced with a resulting decline in stocks at reduction plants.

Rated annual aluminum production capacity of United States plants increased 15,000 tons during the year to 2,483,750 tons when Harvey Aluminum, Inc. announced the completion of 60 new electrolytic cells at its reduction plant at Dallas, Oregon. A further increase in domestic aluminum production capacity was forecast. Cerro Corporation was considering building a production plant along the Columbia River at Wauna, Oregon. Cerro, as a result of its acquisition of the United Pacific Aluminum Corp., had a contract with Bonneville Power Administration to receive 90,000 kw of electrical power for the plant, with the delivery to start September 1, 1963. This amount of power

would permit operation of a plant rated at about 55,000 ton capacity. Consolidated Aluminum Corp. announced that a $27 million basic aluminum plant would be built near New Johnsonville, Tennessee. Howe Sound Co. was considering three sites for a new $45 million aluminum plant. Harvey also announced possible construction of a new 75,000 ton plant in the Pacific Northwest.

Several firms announced a potential increase in aluminum production capacity through utilization of new refractory materials in the cathode electrode assembly. Several standard sized cells have been converted to determine the conditions likely to be encountered in the plant when the new materials are utilized extensively.

Domestic capacity to produce super pure aluminum was increased to nearly 4,800 tons per year when Kaiser Aluminum & Chemical Corp. activated five new cells to produce the 99.99 plus percent metal. Each cell has an annual capacity of 380,000 pounds which increased Kaiser's total capacity to more than 2,650 tons per year. As a result of a new process developed during the year, Aluminum Company of America announced it too would market super pure alumnium. No capacity figure was released.

During September the price of primary aluminum ingot dropped 2 cents to 24 cents a pound. A decrease in the price of aluminum to U.S. customers was first announced by Aluminum Limited. The U.S. producers then announced the reduction to meet the new price. Earlier in the year Kaiser had reduced the price of super pure aluminum from 47½ cents per pound to 45½ cents per pound.

Prepared December 19, 1961, by K. B. Higbie, C. I. Wampler, and Mary E. Trought, under the supervision of P. F. Yopes, Chief, Branch of Nonferrous Metals, Division of Minerals.

[fol. 6628] The major outlet for aluminum in the United States continued to be the building and construction industry according to preliminary data released by the Aluminum Association. Transportation, electrical and container applications were the next most significant consuming areas.

Exports of primary aluminum metal decreased over 50 percent during 1961. For the first none months of the year less than 100 thousand tons of crude and alloyed aluminum

was exported in comparison with over 225 thousand tons in the same period of 1960.

Bauxite: Domestic production of bauxite in 1961 was 1.22 million long tons or 61 percent of that produced during 1960. Total imports of bauxite were approximately 8.7 million tons, equal to the 1960 imports. Jamaica supplied over 50 percent of the imports, Surinam approximately 25 percent, and the Dominican Republic, Haiti, and British Guiana most of the remainder.

The U.S. Government signed barter agreements providing for the delivery of 1.2 million long dry tons of Jamaican-type bauxite, and 1.0 million long dry tons of Surinam-type bauxite.

Research activities aimed at extracting aluminum from new ore sources continued at a high pace. Technological investigations have centered around extracting alumina from raw materials other than bauxite. Olin Mathieson Corp. has piloted a process for producing high-quality aluminum sulfate from domestic clay. North American Coal Co. continued to study the recovery of alumina from coal-mine shale.

Secondary Aluminum: Preliminary data for 1961 showed that in comparison with 1960 the consumption of aluminum-base scrap by industrial users and production of finished aluminum alloys by the independent producers declined. This was the second consecutive year in which the volume dropped. Based on 9 months' figures scrap consumption for 1961 totaled 385,000 short tons, down 56,000 tons or 13 percent from the previous year. The estimated metallic recovery was 323,000 tons and the estimated aluminum content was 300,000 tons. New scrap accounted for 73 percent of the total scrap consumed. The remaining 27 percent was obsolete scrap and sweated pig. Ingot production in 1961 is estimated at 269,000 tons compared with 282,000 tons in 1960. Estimated shipments of finished alloys by the independent producers totaled 271,000 tons, about 9,000 tons less than in 1960. Imports of scrap, an estimated 5,400 tons in 1961 was an increase of about 400 tons compared with the previous year and scrap exports showed an increase of 3,500 tons to approximatley 83,000 tons.

World Review: Bauxite world production, estimated at

24,935 long tons, was 8 percent less than in 1960. Total production of the three principal producers; the United States, Jamaica, and British Guiana showed a decrease of 26 percent. France showed an increase of 15 percent.

Aluminum production in the free world is estimated at 4 million short tons which was approximately equal to the '60 production. France and Japan were the only countries showing production increases in excess of 10 percent. Several new reduction facilities in the United States, Norway, France, Taiwan, and India were completed during 1961, raising the world aluminum production capacity to over 6 million tons.

Several United States firms, in conjunction with various foreign corporations, announced further plans for expansion of aluminum interests throughout the world. Alcoa began development of an integrated aluminum production complex in Australis, and also made plans for the construction of a 20,000 ton per year smelter in Mexico. Kaiser planned a complete aluminum production complex in Australia and New Zealand, and also formulated plans to build reduction and rolling and fabrication facility in Japan. [fol. 6629] Formal approval by the U.S. Government for financial assistance to the Republic of Ghana for construction of a hydroelectric dam and aluminum refinery was given. The $196 million dam will be financed with $98 million from Ghana, $27 million from the U.S. Development Loan Fund, $10 million from the Export-Import Bank, $47 million from the World Bank, and $14 million from Great Britain. The dam will provide power for an aluminum refinery to be built by a consortium composed of Kaiser and Reynolds.

Several announcements were made concerning possible new aluminum plants in other areas. Kaiser Aluminum & Chemical Corp. was awarded permission to proceed with plans for a plant with minimum capacity of 22,000 tons in Argentina. Kaiser also negotiated with the Dutch Government for construction of a new primary aluminum plant in the Netherlands. Reynolds considered building aluminum plants in the Philippines, Turkey, and Kuwait. Harvey participated with the Nova Scotian Government in a survey and study to determine the feasibility of an integrated aluminum facility there.

DEFENDANTS' EXHIBIT 76

Economic Study

Use of Aluminum and Copper Conductors on Consolidated Edison System

[fol. 6631] February 9, 1959.

Re: Use of Aluminum and Copper Conductors on Consolidated Edison System

Mr. F. Van Olinda
Outside Plant Engineer

The attached economic study, dated February 5, 1959, on the above subject covers three major applications of aluminum on our distribution system, namely:

1. Aluminum for network bus.
2. Aluminum for underground secondary mains.
3. Aluminum for overhead conductors.

Economic comparisons are given in the study to cover costs involved in the use of aluminum or copper for each application. The report also incorporates technical reasons for the various operations involved, and a number of pertinent drawings and procedures are included. All cost data are based on figures applicable to the Brooklyn, Queens and Bronx areas.

Conclusions and recommendations based on the findings in this report are as follows:

1. Aluminum has been used on buses in network vaults since 1953 and our field experience to date and as determined by three separate inspections of these installations has been completely satisfactory. The use of the aluminum integral web bus with premanufactured snap on insulation is very popular with the field forces because of the lightness of the bus and simplified insulation. The cost of this type of bus is 53 per cent of the cost of insulated copper bus. The continuation of the practice of using this aluminum bus is justified and there appears to be no foreseeable reason for a change in this practice.

2. A trial installation of 2,200,000 feet of aluminum mains on the underground network system has been completed and we have developed methods and equipment which were put into effect and which would enable us to use aluminum if the time arrives

again when copper is unavailable or when this change could be justified. However, the cost of [fol. 6632] aluminum mains in comparison with copper mains is very much higher. Our estimates indicate that the installed costs for aluminum mains are 50 per cent higher than for copper mains. The main reasons for these higher costs are: (a) more labor and materials needed in splicing; (b) need for larger service boxes; (c) increase in costs due to the need of connections between copper and aluminum which are continually encountered on our system; (d) additional tools, etc.

There appears to be no justification for the use of aluminum on underground mains on the basis of current and foreseeable cable and installation costs. In cases of emergency, when copper is unavailable enough development work has been done so that we could then go to the use of aluminum.

3. Work on our overhead distribution system consists mainly of relatively short extensions to the existing copper overhead primary and secondary mains and, of course, the addition of services. Under these conditions, there appears to be little, if any, difference between the costs of aluminum extensions and copper extensions at the current cable prices and with available splicing techniques.

Our experience reveals that where aluminum has been used, as described above, we have more trouble calls. The reason for the inferior operating record for aluminum is galvanic corrosion between copper and aluminum where these two metals come together and also due to the fact that aluminum to aluminum connections and aluminum to copper connections are not as satisfactory as copper to copper connections. Where aluminum is involved greater care is required in making these connections and the application of inhibitors is required. The use of aluminum in conjunction with the existing copper introduces the need for additional tools, and the field forces strongly object to the use of aluminum because of this and other practical difficulties.

[fol. 6633] On the basis of current cable prices and the type of connections available in splicing aluminum there appears to be no economic or operating advantage in its use on our system. This situation, however, should be reviewed annually on the basis of cable costs and any improvements which may occur in the connection devices. We should also continue to follow developments on aluminum connectors since their performance is pertinent to this problem.

——, ——, Division Engineer, Equipment Division.

cox.m

[fol. 6634] Introduction

This is a report of studies made to determine the economics of the use of aluminum in place of copper as an electrical conductor on our System. It is presented in three parts, viz. overhead, underground and network buses.

The material used in each of these three fields of application, the construction methods required, and personnel involved make for a natural division into the three groups. Thus if it is decided to use aluminum in one port and copper in another, no conflict of material, accessories, or personnel will result.

In adition to the studies noted above a section is included of source information of cable prices, and some EC specifications for overhead construction.

[fol. 6635]

Part I.

Aluminum for Network Bus

[fol. 6636] ### Comparative Costs of Aluminum vs Copper For Network Bus Construction

Aluminum has a fundamental advantage over copper in bus construction for two reasons; it weighs about half as much as an equivalent copper conductor of same conductivity, and manufacturing costs are substantially less because aluminum shape is extruded whereas the copper is not but must be shaped by much more costly methods. In the case of our standard aluminum bus (6′ x 5″ x ⅜″ integral web channel) the weight is just 42% the weight of equivalent copper (6″ x 6″ x ¼″ square tube).

At recent metal prices (aluminum at 25.2¢ and copper at 26.5¢/lb.) the purchase prices of aluminum and copper bus were quoted as follows:

	Costs Per Circuit Foot	
	Bare Conductor	Insulated Conductor
Copper	$39.60	$55.12*
Aluminum	14.43	25.97
Difference in favor of aluminum	$25.17	$29.15

The 33% additional cost to insulate copper results from the larger surface to be covered and the need for clips to hold in place which are not needed in the case of the aluminum channel, the shape of which is more suitable for "snap-on" insulation.

Since shop fabrication and installation costs are about the same for aluminum and copper, a reversal in this economic comparison is not likely.

Because of its lighter weight, the field forces prefer to use the aluminum bus.

Experience with the use of aluminum bus over a period of six years has been satisfactory in that the field inspections have revealed no faulty connections.

In the case of a 6 bank (460 V) job the saving in using aluminum as compared with copper is

120′ at $29.15 = $3,500 approx.

This is a saving of 53% over the purchase price of copper tube with insulation.

On the basis of present usage, there is an annual saving of approx. $39,000 realized by the use of aluminum bus.

Prepared by: L. F. Porter

[fol. 6637] Part II.

Aluminum for Underground Secondary Mains

[fol. 6638] Aluminum Underground Secondary Mains

Some 2,200,000 feet of aluminum 350 MCM mains cable have been installed on the underground network. This consists of a trial installation of 67,000 feet in 1952-53 and approximately 2,140,000 feet purchased in 1955 when a considerable price differential occurred favoring aluminum over copper. While operating experience with aluminum cable has been good, in that we have no record of failures, the installation cost is substantially higher than for copper and greater care is necessary to make good electrical connections. Since larger service boxes are required for splicing, the box enlargements necessary to accommodate aluminum make its general use for reinforcing existing systems excessively high in cost.

The aluminum mains were installed only in Brooklyn and Queens because much of the conduits in Manhattan and Bronx are less than 4", the minimum size required for aluminum. Also, this cable was pulled only at those locations where its use would not entail service box enlargements. Most of the cable was spliced using copper joints and copper-to-aluminum adapters since aluminum accessories were not available. However, aluminum designs have been developed for both crab and joints and individual cable limiters, and trial installations have been made of both. While aluminum limitered crab joints have not been developed because of the time and expense involved for dies, molds, etc., they could be developed if required. No satisfactory design has yet been worked out for adapters to connect aluminum services (smaller than 350 MCM) in an alumi-

*Insulation cost estimated

num mains connector. These would be required if small aluminum services were to be used. The installation of the aluminum cable has been handicapped for a lack of a tool suitable for both copper and aluminum joints. A manufacturer is now developing such a tool, similar to the one used on copper, which is expected to be satisfactory for use on existing copper crab joints in addition to making aluminum joints.

Aluminum has certain characteristics which make it less attractive than copper, particularly for underground use: (1) the oxide layer on aluminum makes it more difficult to make an electrical connection because of the need for cleaning strands, using an oxide inhibitor in each joint and the requirement for a larger compression joint; (2) it is very susceptible to a-c corrosion; a defect in the insulation admitting a slight amount of water may lead to cable failure; (3) the cable, which has approximately 25 per cent larger outside diameter than equivalent copper, requires a minimum size 4-inch duct and the substantially larger joints require larger service boxes than would be required for the same number of copper circuits. This means that bringing a set of aluminum mains into an existing service box or replacing a set of copper mains with aluminum will frequently require a box enlargement which would not be necessary if copper were used for the new circuit.

Labor to splice aluminum is high because: (1) since we have an existing copper system, many of the aluminum connections will be made to existing copper joints, by means of adapters, at a labor cost at least twice as high as would be required for an all-copper joint; (2) in the case of all-aluminum construction approximately 20 per cent more splicing labor is required than for copper, and splicing material costs an estimated 50 to 75 per cent higher; (3) in the case of neutral cable, the aluminum must be insulated from water and where it is connected to bare copper neutrals the additional expense of water seals is incurred. For these reasons, the use of aluminum as a neutral conductor is even less attractive than its use as a phase conductor.

In the case of the aluminum cable purchased in '55, it is estimated that the installed cost was 7 per cent higher than copper costs would have been, although the purchase price for the aluminum was $2.36, as compared with $3.31 per

circuit foot for copper. Had aluminum joints been available for the installation work, it is estimated that the aluminum and copper costs, installed, would have been about the same. These comparisons are on the basis of cable installation costs, only, as box enlargements were avoided by selecting locations where enlargements would not be required.

[fol 6639] On the basis of present costs, the use of aluminum is definitely uneconomical and it appears very improbable that aluminum cable costs can become low enough in comparison to copper to compensate for the discrepancy in installation costs as illustrated in attached Table I.

attach.

[fol. 6640] Aluminum Underground Secondary Mains

Table I

Summary of Costs
(Dollars Per Circuit Foot)

		Aluminum Circuit (1)	
	Copper (1) Circuit	Installed on Existing Copper System	Installed in New Subway
Installation	$1.04	$1.47	$1.26
Loss Salvage (Present Worth)	−.29	−.16	−.16
Add'l Service Box Enlargements (for aluminum) (2)	....	.90	.16
Net Installation	.75	2.21	1.26
Present Cable Costs ('58)	2.28	2.33	2.33
Total	$3.03	$4.54	$3.59

(1) Copper Circuit: Phase cables = 6 − #4/0 R/N + 2 − #4/0 bare copper
Aluminum " Phase cables = 6 − 350 MCM R/N (aluminum) + 2 − #4/0 bare copper

(2) Where new subway is built for aluminum cable, some service boxes must be built larger than is required for copper cable. If aluminum cable is used for all mains work (reinforcements, extensions and replacements), then some existing service boxes must be enlarged and new service boxes must be larger because of the larger aluminum splices as compared with copper.

[fol. 6641] Aluminum Underground Secondary Mains

Appendix A

1. Cable Prices Per Circuit Foot

	1955	1958
6−#4/0 R/M+2−#4/0 bare (all copper)	3.31	2.28
6−350 MCM R/N (aluminum)+2−#4/0 bare copper	2.60	2.33
*6−350 MCM R/N (aluminum)+2−350 MCM Polyethelene covered (all aluminum)	2.36	2.37

2. Basis of Comparison—Installed Costs

(a) Comparison on circuit foot basis
(b) Circuit length (average) = 150 ft.

3. Salvage of Cable Removed in Future

Salvage price of copper = 80% copper price. Salvage price of aluminum = 22% aluminum price. Assuming cable has an average life of 25 years, present worth of salvage = 23% of future salvage value (interest at 6%). For purpose of this study, future copper price is assumed to be 30¢ per lb. aluminum 25¢ per lb.

4. Installation Cost Data—Direct Cost Only—No Overhead

(a) Copper Cable Installation Costs
6−#4/0 R/N and 2−#4/0 Bare−$1.04 per circuit foot

(b) Aluminum Cable Installation Costs

Circuit	Installed on Existing Copper System	Installed in New Subway
6−350 MCM R/N (aluminum) +2−#4/0 bare (copper)	$1.47	$1.26
*6−350 MCM R/N = 2+350 MCM Polyethelene covered (all aluminum)	1.72	1.40

* Installed in 1955–58. Not recommended for future consideration.

[fol. 6642] Aluminum Underground Secondary Mains

Appendix B

Additional Subway Costs

Incurred by use of Aluminum Mains

I. Reinforce Mains on Existing System—Survey of Typical Areas

A. Brooklyn—

1. Total trench feet of subway	50,500
2. Total No. of service boxes and manholes	413
3. Average section length—(Approx.)	120'
4. To add (1) additional circuit copper main—thru-out enlarge 43 service boxes to 'S' boxes	
5. To add (1) additional circuit of aluminum mains thru-out enlarge 26 service boxes to 'S' boxes	
" 15 service boxes to 'TS' boxes	

B. Queens—

1. Total trench feet of subway	45,600
2. Total No. service boxes and manholes	285
3. Average section length—(Approx.)	160'
4. To add (1) additional circuit of copper mains—thru-out enlarge 69 service boxes to 'S' boxes	
" 2 service boxes to 'TS' boxes	
5. To add (1) additional circuit of aluminum mains—thru-out enlarge 88 service boxes to 'S' boxes	
" 37 service boxes to 'TS' boxes	
" 3 service boxes to manholes	

C. Brooklyn and Queens Areas Combined (Difference between Aluminum and Copper)

1. In recent years secondary mains work has been divided as follows— Brooklyn 40% (Approx.)
Queens 60% "

2. Additional service box enlargements required for aluminum per 1000 circuit feet of mains cable installed:

	Number
Increase to 'S' box	.38
" to 'TS' "	.38
" to manholes	.04

3. Cost of service box enlargements

to 'S' boxes	.38 x	$ 614 =	$234	per 1000 circuit ft.
to 'TS' "	.58 x	772 =	448	" " " "
to manholes	.04x	2,374 =	95	" " " "
		Total	$777	

[fol. 6643]

4. Cost to divert ducts and piece-out mains cables

Since some service boxes must be relocated to permit enlargement, duct diversions and mains piece-outs are required.

a. Number of diversions required per 1000 circuit feet of new mains installed = .50
b. Cost of duct diversions
.50 x $350 = $175 per 1000 circuit feet
c. Cost of mains piece-outs
.50 x $264 = $132 per 1000 circuit feet

5. Total Cost to Enlarge Service Boxes

a. build service boxes	$ 777	per 1000 circuit ft.
b. divert ducts	175	" " " "
c. piece-out mains	132	" " " "
Total	$1,084	

II. Extend Mains—New Subway

Based on survey of jobs issued, additional cost of boxes to accommodate aluminum cable (additional to requirements for copper cable)
$160 per 1000 circuit feet

III. Weighted average of enlarging existing service boxes and building larger new service boxes for aluminum.

It is estimated that 80% of all mains cable splices are made in existing or enlarged service boxes. On this basis, the weighted average incremental cost of service boxes for aluminum is $900 per 1000 circuit feet higher than would be required for copper cable.

[fol. 6644] Part III

Aluminum for Overhead Conductors

[fol. 6645] Resume and Conclusions

Overhead System Cost Study

Study of the Overhead use of copper and aluminum was made in three pieces, viz.

A) Primary Feeder Installations (Table I)
B) Secondary Mains Installations (Table II)
C) Service Drops (Table III)

An examination of the data in these tables indicates that on our System there is little or no saving in the use of aluminum cable over copper. This is due to the higher installation cost for aluminum.

Table IV compares costs for a package installation for various combinations. Again it is seen that the savings realized are small and when scrap values are included the saving is in favor of copper for covered primary.

Appendix I indicates the derivation of a formula for use in determining when to purchase aluminum or copper cable.

Appendix II covers the evaluation of the factor "k" for use in the equation of Appendix I.

This situation should be reviewed on a yearly basis or whenever there is a large difference in the prices of the raw copper and aluminum.

Plate I shows the variation in the price differences between copper and aluminum cables of comparable current carrying capacities. It also shows the variation in price difference between the raw metals.

Data on cable prices and specs relating to Overhead Construction are included under "Source Data".

[fol. 6646] Pertinent Facts Needed to Evaluate the Use of Aluminum

Aside from the matter of material and construction costs, aluminum as a metal has characteristics which make it a difficult one to work with from an electrical point of view. Surface oxides, having a high electrical resistance, form almost instantly after the surfaces have been cleaned. To

obtain oxide free surfaces to provide a low resistance joint, they must be cleaned of oxide through a grease coating that prevents the entrance of air to the surfaces being cleaned. Practically, this means that additional care must be used in preparing oxide-free surfaces at points where joints are to be made. This requires special training of men and closer supervision.

In addition, aluminum is relatively soft and cold flows under sustained pressure. This action reduces contact pressure in the joint, increases joint resistance, and results in joint failure if the connector is not properly designed.

Electrolytic potencial between copper and aluminum is in the order of 2 volts. In the presence of an electrolyte, corrosion takes place. This very frequently results in the formation of high resistance compounds in the joint that leads to ultimate failure. In other cases the aluminum conductor is corroded through at a point near the connector.

To prevent entrance of moisture into the joint a very thorough insulating job must be done. A covering that permits entrance of moisture and traps at the joint will result in more corrosion than if no covering had been provided.

Thus wherever aluminum conductors are joined to copper the possibility of electrolytic corrosion exists and special attention is required to limit its occurrence.

For this reason it is recommended that on new construction we do not intermix copper and aluminum conductors; that we install either all aluminum (primary, secondary, and service drops) or all copper as prices dictate.

To this end the formula developed for use in purchasing is based on a "package" deal consisting of average extensions of 600 feet of 4 wire primary, 600 feet of 4 wire secondary and 16 3 wire service drops of 50 feet each.

Galvanic corrosion at connections where copper and aluminum come together brings about an incremental rate of failure as compared to an all copper system. The "cold flow" property of aluminum under connector pressure is another source of difficulty which has been non existent in the case of all copper connections.

With added experience and continuing development of connectors by manufacturers the time will come when these connectors will have the same reliability as those used on copper.

[fol. 6648]

For Covered Primary

#6 Cu vs #4 Al	1,963.20	2,044.03	−80.83	−4.1
#2 Cu vs 1/0 Al	2,126.32	2,135.59	− 9.27	−0.43

Notes:

1. Scrap value of copper taken as 60% of electrolytic.
2. Scrap value of aluminum taken as 22% of virgin metal for covered wire and 41% for bare wire.
3. Assumed cost of copper 25 yrs. hence—30¢ per lb.
4. Assumed cost of aluminum 25 yrs. hence—25.2¢ per lb.
5. Present value of scrap is 23% of its value 25 yrs. hence.

1-28-59

[fol. 6651] Appendix I

Development of Formula for Purchasing Cable For Overhead Use

When installed cost of aluminum cable is equal to the installed cost of copper cable there is no advantage (saving) in the use of aluminum.

This is expressed by the following equation:

$$I_c + C_c - S_c = I_a + C_a - S_a \qquad \text{(Equation A)}$$

Where I = Installation Cost
C = Cable Cost (Purch. Price x 1.21)
S = Scrap Value

Subscripts: $_c$ = copper; $_a$ = aluminum

For this study (Nov. 1958) I, C, and S will be taken for a package deal, viz; 600 ft. of 3¢, 4 wire pri., plus 600 ft. of 3¢, 4 wire secondary, plus 16—3 wire services.

$I_c = 281.68 + 205.82 + 418.88 = 906.38$
$I_a = 474.01 + 271.16 + 430.88 = 1176.05$
$C_c = 515.07 + 515.07 + 143.68 = 1173.82$
$C_a = 393.15 + 393.15 + 95.20 = 881.50$

Scrap value of copper is approximately 80% of virgin while that of aluminum is 22% of virgin for covered cable and 41% for bare cable.

600 feet of 2/0, 4 wire, pri. copper cables contains	600 x 4 x 0.403 =	967# copper
600 feet of 2/0, 4 wire, sec. " " "	=	967# "
Sixteen 50' runs of 3 wire cu. Service cables "	50 x 3 x 16 x 0.0795 =	191# "
	Total	2125# "

Present value of scrap copper to be sold 25 years hence is 23% of the assumed scrap price at that time.

If we assume a price of 30¢ per lb. for virgin copper its scrap value today is 30.0 x 0.8 x .23 = 5.5¢ per lb.

Total scrap value is 2125 x .055 = $117.00.

The aluminum conductors weigh 1068#; therefore if we assume a value of 25.2¢ for virgin aluminum the present per pound scrap value is $0.0127 for covered cable.

The total scrap value is 0.0127 x 1068 = $13.70.

Transposing the equation, we get

$$C_c = (I_a - I_c) + (C_a - S_a + S_c)$$

[fol. 6652] This equation gives the break even price that may be paid for copper cable when the price of aluminum cable is known.

Example:

For values given above

$$C_c - (1176.05 - 906.38) + 881.50 - 13.70 + 117.00$$
$$= 269.67 + 881.50 + 103.30 = 1254.47$$

This represents the maximum price that may be paid for copper cables to break even. Comparing this with prices of copper cable shown, in the report we observe

From Table I (600 ft. extension), Covered Cable	$ 515.07
From Table II (600 ft. extension), Covered Cable	515.07
From Table III (16 service drops @ 8.98 ea	143.68
Total price of copper cable	$1173.82

Since this value is less than the $1254.47 determined by the formula, we should be using copper instead of aluminum now.

On the basis that this is done and we start using copper, should aluminum costs change in the future to indicate equal costs to copper, we should not make the change at that time. To avoid seesawing a factor (k) of 1.20 should be introduced to Equation A, this factor being designed to cover certain incremental costs associated with aluminum which could not be readily evaluated. (See Appendix II) This would change the form of Equation A to

$$I_c + C_c - S_c = k\,(I_a + C_a - S_a) \quad \text{(Equation B)}$$

By the same token if at some future time aluminum is in use on our system and we are considering reverting to copper due to economic and other reasons, then, the factor (k) to be used in Equation B should be 1.10 instead of 1.20 in order to avoid frequent reversals of procedure.

A. F. Newman.

1-28-59

[fol. 6653] Appendix II

Derivation of Factor "k"

In order to arrive at the "k" factor in the equation of Appendix I it is necessary to evaluate some of the incremental operations involved in the use of aluminum conductors. Some of the items are impossible to evaluate exactly but approximations will be made.

The operations referred to are:

1. To prevent electrolytic corrosion of copper—aluminum joints special care is required to properly insulate the joint to prevent entrance of moisture.
2. Wire brushing of aluminum conductors to remove oxides at the joint location and the application of grease to minimize reoxidation requires additional care and effort.
3. To obtain good low resistance joints proper bolting torques must be used. This is more important with aluminum than with copper due to the aluminum being softer than copper.

All of these items require more labor and supervision than for their equivalent copper joints. While our figures on primary and secondary mains reflect the real costs involved with the two metals the incremental costs in labor and supervision involved in services are not in the picture. It is estimated that these costs will be 10% greater for aluminum than for copper.

For our Package which includes 16 Services, 10% of the total labor and supervision costs for services is $33.

Because of the characteristics mentioned in items 1, 2 and 3, there are more complaints of flickering lights and no lights. This is not conducive to good customer relations and also it means that a crew must be sent out to correct the complaint.

Currently, the failure rate of aluminum joints is greater than copper by 4 per 1000 services per year. However, since electrolytic corrosion, reoxidation, and loss of contact pressure due to cold flow of aluminum are cumulative effects, it is expected that the failure rate will increase with time. Just how such this increase will be is not predictable.

The number of failures of copper joints is very low.

The average cost of a service call is $25. On the basis of 4 calls per 1000 services in the first year the outlay is $100 per 1000 services. With the increase of failure rate over the years, we can assume conservatively an average cost of $150 per 1000 services per year.

This represents the excess yearly maintenance cost due to the use of aluminum and is a continuing one. The present worth of this expenditure over a 25 year period is $150 \times 12.78 = \$1916/1000$ Services. For our Package the present worth is $\frac{1916}{1000} \times 16 = \$30.60$. If the number of failures per year increase beyond the value assumed, then this figure would have to be increased correspondingly.

[fol. 6654] In addition to the above, if purchase of aluminum and copper cable were being made on small changes in prices, accessories and cable will be in stock for both metals. It is estimated that it will add 7½% to the handling costs of the materials. This would amount to $.075 \times 1356 = \$101.75$ for the Package. The figure at $1,356 represents the cost of materials in the Package.

The sum of the items enumerated above amounts to $101.75 + $30.60 + $33.00 or $165.35. This represents 8.3% of the Package cost.

It is believed that a differential of 20% in installed costs represents a better evaluation of the disadvantages associated with the use of aluminum, and to avoid frequent seesawing from one metal to the other. The constant (k) of Equation B then becomes 1.2.

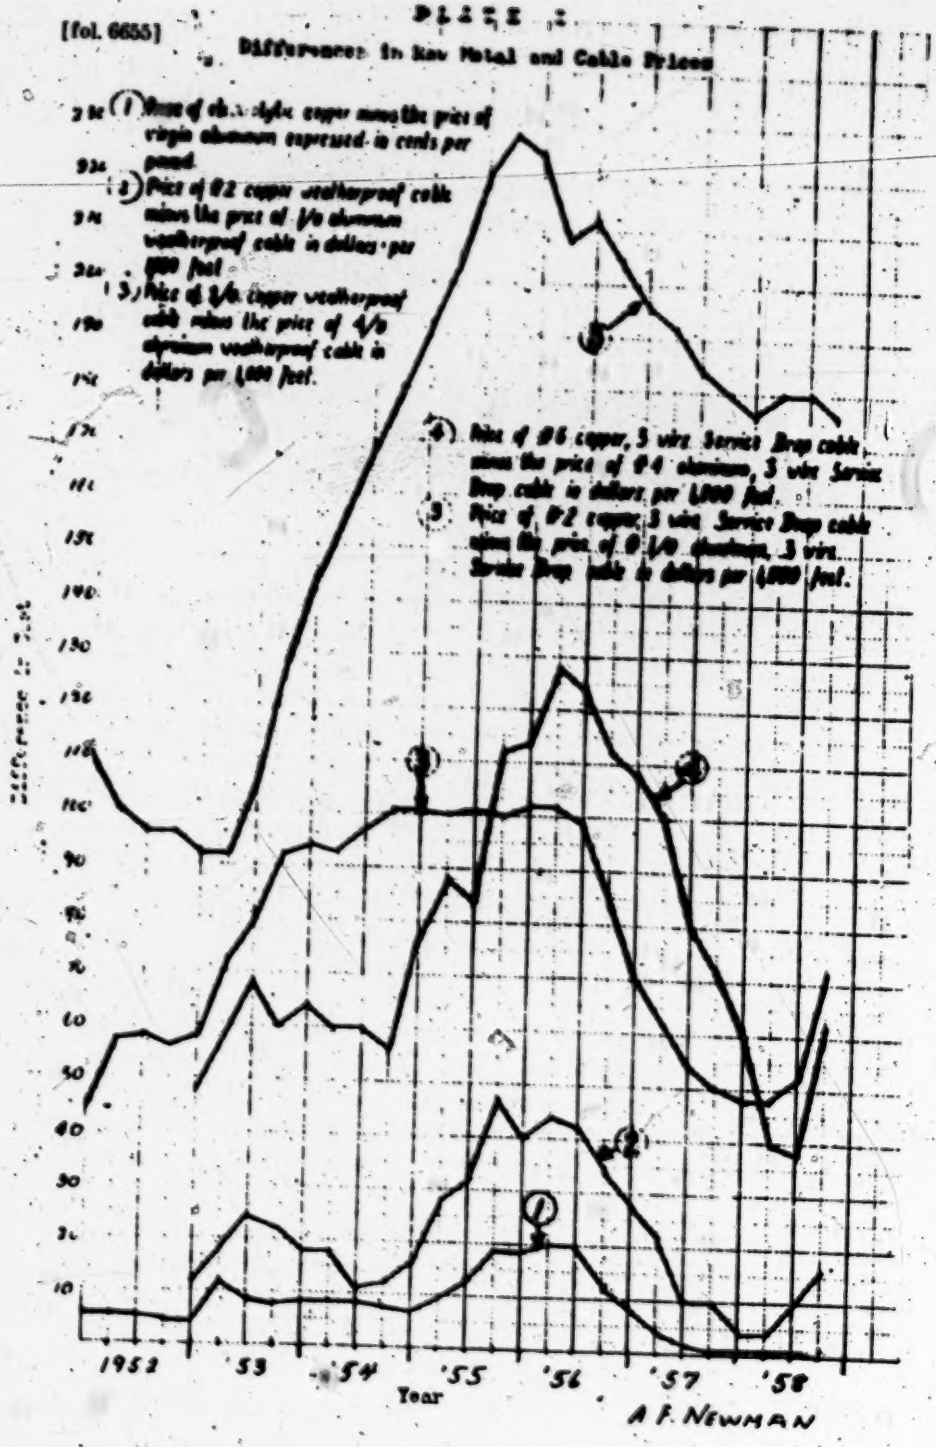
PLATE 2

Differences in Raw Metal and Cable Prices



[fol. 6656] Source Data

[fol. 6657] Consolidated Edison Company of New York, Inc.

Memorandum

November 20/1958.

Re: Copper vs. Aluminum Cable

Mr. F. Van Olinda
Outside Plant Engineer

Attention: Mr. C. P. Xenis

In accordance with your recent request, the prices paid for certain overhead cables made of copper and aluminum conductors have been reviewed and are shown on the attached tabulations, together with the corresponding prices of Electrolytic Copper and Ingot Aluminum.

The data has been incorpoarted into chart form for the Weatherproof Wire and Service Drop Cables as per attached Charts. There were too few transactions to warrant charting the Bare Wires.

From the data and the charts, it is apparent that, in general, the copper cables fluctuate in line with major changes in the price of Electrolytic Copper. The aluminum cables have sold with little regard to the prevailing price of Aluminum Ingot, since the aluminum fabricators have been more interested in capturing markets from copper. Hence aluminum cable prices have been dominated more by the competitive situation of the moment, rather than by basic metal prices. This tendency is expected to persist for sometime in the future.

It will be noted that during the seven year period under review, copper has risen from 24½¢ to 46¢ per lb., declined to 25¢ and is currently selling for 29¢ per lb. Aluminum on the other hand, has only risen from 19¢ to 28.1¢, declined to 26.1¢, and is currently selling for 26.8¢ per lb. There is a marked disparity in the relationship between scrap and

virgin metal prices, viz: Scrap Copper 23¢ vs. 29¢ Virgin, Scrap aluminum 6-11¢ vs. 26.8¢ Virgin. This fact should be taken into consideration in any long range study.

Similar studies will be made on the Underground Cables.

David [copy illegible], Manager, Cable Bureau.

DEFENDANTS' EXHIBIT 77

Ebasco Services, Incorporated

Engineers—Constructors—Business Consultants

Two Rector Street

New York 6, N. Y.

Cable Address "Ebascoe"

April 3, 1958.

Mr. R. V. Davies, Vice President
Aluminum Company of America
1501 Alcoa Building
Pittsburgh 19, Pennsylvania

Dear Mr. Davies:

It was a pleasure to talk with you on the telephone today about how Ebasco could be of service to Alcoa in its insulated cable and wire program. I appreciate your confidence in asking us to proceed with the first preliminary step.

As we discussed, the first step would be to prepare a list of companies in the insulated cable and wire manufacturing field from published and other available sources. Pertinent data would be compiled on each, including size, sales volume, products, earnings record, capitalization, stock ownership, markets served, location and size of plants, affiliations or connection with other companies, banking connections and the like. From this preliminary data a number of companies will be selected by consultation with you as being most suitable for further study and more complete data will be obtained on these companies.

Billings for our services shall be at applicable per diem rates (which are based on a normal work day of 7½ hours) in effect for the classification of personnel engaged on your work applied to the actual time such personnel are specifically so engaged. We shall be reimbursed at cost for "out-of-pocket" expenses, including traveling and living expenses, telegraph and telephone toil charges and similar items.

The work will be the responsibility of our Corporate Finance Department which is headed by F. W. Ohles. We should have most of the data assembled in about three weeks' time and either I or Mr. Ohles will contact you toward the end of April and arrange to get together for discussion of the data and our conclusions.

I appreciate this opportunity of again being of service to you, and with best personal regards,

Very truly yours, F. C. Gardner, President.

DEFENDANTS' EXHIBIT 78

June 16, 1958.

Memorandum from
Corporate Finance Department
To: H. Richter
From: W. C. Huebner
Subject: Re: Cable Companies Study

In line with our discussion of June 13, the following areas are of interest to us for as many of the companies (already given to you) as you have the information.

A Product Line

1 Diversity
2 Quality
3 Prices and pricing policy

B Technical and Manufacturing

1 Manufacturing know-how
2 Engineering and technical reputation
3 Quality control of product

C Company Performance

1 Accuracy of bids
2 Delivery performance

3 Complaints and servicing
4 General standing and regard

D Plant

1 Condition of facilities (maintenance, housecleaning)
2 Modernity
3 Location with respect to materials and customers

E Management (personal comment by individuals and position)

1 Quality
2 Depth
3 Age and general health
4 Experience
5 Sales organization (aggressive, technically competent)

1960	Reynolds/Alcoa $44,899 (10%)		$85,884 (19%)	$67,434 (15%)	$38,815 (8%)	$11,000 (2%)	$44,767 (10%)	$132,700 (29%)	$30,193 (7%)	— —	$455,754
1961	$69,511 (8%)		$10,408 (2%)	591,591 (62%)	$121,119 (13%)	$78,352 (8%)	— —	1963 —	Olin $64,000 (7%)	$745 —	$924,914
Total 1960/61	$114,910 (9%)		$103,492 (7%)	$658,025 (46%)	$159,932 (12%)	$89,909 (6%)	$44,767 (3%)	$134,168 (10%)	$94,237 (7%)	$745 —	$1,378,190

In 1958 Crouse Hinds placed for transmission conductors with Anaconda ($322,078) and Alcoa ($129,801). Defendants' records are not immediately available for 1959 but it would appear that Rome did not participate in any aluminum business in that year. Anaconda, Alcoa, General, Kaiser & Southern shared in Defendants' purchases.

OCTOBER TERM, 1962

No. —

UNITED STATES OF AMERICA, APPELLANT

v.

ALUMINUM COMPANY OF AMERICA AND ROME CABLE CORPORATION

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE NORTHERN DISTRICT OF NEW YORK

JURISDICTIONAL STATEMENT

OPINION BELOW

The opinion of the district court (App. A, *infra*) is reported at CCH, 1963 Trade Cases ¶ 70,653. The findings of fact and conclusions of law (App. B, *infra*), are unreported.[1]

[1] As printed herein, the opinion reflects corrections made by the district court and communicated to appellant and appellees on February 20, 1963. Subsequent to the filing of the district court's opinion, findings of fact, and conclusions of law, appellees moved under Rule 52(b), Fed. R. Civ. P., for additional findings of fact. The additional findings requested by appellees were adopted by the district court on February 21, 1963, and are included in Appendix C.

JURISDICTION

The judgment of the district court was entered on January 28, 1963. The notice of appeal was filed by the United States on March 29, 1963. The time to docket the appeal was extended by the district court to and including June 11, 1963. The jurisdiction of the Court is conferred by Section 2 of the Expediting Act of February 11, 1903, 32 Stat. 823, as amended, 15 U.S.C. 29. *United States* v. *du Pont & Co.*, 353 U.S. 586; *United States* v. *Columbia Steel Co.*, 334 U.S. 495.

QUESTION PRESENTED

This case concerns the validity under Section 7 of the Clayton Act of the acquisition by Aluminum Company of America (Alcoa), the nation's largest producer of primary aluminum and aluminum conductor wire and cable, of all the stock and assets of Rome Cable Corporation (Rome), one of the few substantial independent fabricators of aluminum conductor wire and cable. The question presented by this appeal is whether the acquisition of Rome by Alcoa may substantially lessen competition or tend to create a monopoly in the production and sale of (i) aluminum conductor wire and cable and (ii) insulated aluminum wire and cable, in violation of Section 7.

STATUTE INVOLVED

Section 7 of the Clayton Act, 38 Stat. 731, as amended, 64 Stat. 1125, 15 U.S.C. 18, provides in pertinent part:

> No corporation engaged in commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no

corporation subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of another corporation engaged also in commerce, where in any line of commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly.

STATEMENT

1. The merging companies

Alcoa is a fully integrated aluminum producer, owning and operating its own shipping lines, water companies, railroads, electric power systems, and coal properties as well as many raw material locations, refineries, and plants for the production and fabrication of aluminum (GX 49). Its three refineries and thirty plants—exclusive of Rome facilities—produce a full range of primary, intermediate and fabricated aluminum products, including, *inter alia,* ingot, sheet and plate, rod, extrusions, castings, foil, and aluminum conductor wire and cable (Fdg. 12, App. B).

Alcoa is, by a substantial margin, the largest domestic producer of primary aluminum. In 1960 it had assets of $1.4 billion and gross revenues of $870 million (GX 49). In that same year its primary capacity (existing or under construction) was 38.6 percent of the nation's total, approximately 45 percent greater than that of the next largest producer (Reynolds Metals Company, with 26.4 percent), approximately 67 percent greater than that of the third largest producer (Kaiser Aluminum & Chemical Corp., with 23 percent), and more than 200 percent

greater than the remaining three primary producers together (Ormet, Inc., with 6.8 percent; Harvey Aluminum, with 2.8 percent; and Anaconda Aluminum Company, with 2.4 percent) (App. A, 8a).

The lines of commerce upon which the merger would bear most heavily are aluminum conductor wire and cable ("aluminum conductor") and insulated or covered aluminum conductor wire and cable ("insulated aluminum" or "aluminum insulated"). Conductor wire and cable is a major end use of aluminum. Thus, in 1958 the total United States production of primary aluminum ingot was 3,131 million pounds, while 226 million pounds of aluminum conductor were produced, of which 51 million pounds were insulated wire and cable (AR 49; GX 434, GX 436).

Prior to this merger, Alcoa was also the leading producer of aluminum conductor and the third largest producer of insulated aluminum conductor (GX 434, GX 436). In 1958, the last year before the Rome acquisition, Alcoa shipped 27.8 percent of aluminum conductor wire and cable, and 11.6 percent of insulated aluminum conductor (Fdg. 45(a); App. B).

Rome Cable Corporation was incorporated in 1936 and began business in Rome, New York, as a fabricator of copper conductor wire and cable. By the time it was acquired twenty-three years later, Rome had established two additional plants, at Collegeville, Pennsylvania, and Torrance, California, and had grown into one of the nation's largest and most important independent fabricators of aluminum and copper wire and cable products. One year after its incorporation, Rome reported assets of $1.9 million

and annual sales of $1.8 million; on March 31, 1958, a year before its acquisition, Rome's assets had increased to $24 million and its annual sales to $40.6 million (GX 9, GX 17, GX 47). In the five years preceding the acquisition, Rome's sales averaged $47 million annually (GX 7).

Rome enjoyed an excellent reputation in the trade because of its broad range of high quality aluminum and copper conductor and accessory products, its high degree of technical skill, and its substantial progress in research and development. As one of four independent fabricators which were integrated backward through the aluminum rod-making stage (Tr. 403–404, 743, 1895), Rome produced both aluminum and copper rod for its own use and for resale to others (Fdg. 16, App. B). Thus while most independents must buy aluminum rod, an intermediate product, for drawing into wire, Rome was able to buy aluminum ingot, the primary product—a significant competitive advantage (Tr. 116; Tr. 1008–1009). Its range of conductor and accessory products compared favorably with the offerings of other independent fabricators, and was much broader than Alcoa's (Tr. 1263–1264). In 1958, the last year prior to merger, Rome accounted for 1.3 percent of aluminum conductor shipments, and 4.7 percent of aluminum insulated conductor shipments (Fdg. 45(a), App. B).

2. The merger in its commercial setting

As noted above, in 1958 alone, 226 million pounds of aluminum conductor wire and cable were produced, almost exclusively for use by electric utilities in carry-

ing electric power from generating plants to consumers throughout the United States. Copper is the only other material utilized commercially for the same general purpose. However, each metal has found, or is in process of finding, those particular utility applications for which it is peculiarly fitted from a commercial standpoint.

The 3,300 operating electrical utilities which presently purchase such wire have developed clear patterns of use for copper cable and for aluminum cable, both in transmission lines (the "wholesale" lines which carry current at high voltages to substations) and distribution lines (the "retail" lines which route the electricity at reduced voltages from the substations to the consumers). Both types of lines are usually strung above ground, except in heavily congested areas, such as city centers, where they are run underground. Underground, where the conductor must be heavily insulated, copper has always been and remains today virtually the only conductor used (GX 468). Overhead, where transmission and some distribution lines are bare and other distribution lines are less heavily insulated, aluminum has replaced copper at a rapid rate. By 1950, 74.4 percent of all additions to overhead transmission lines were being constructed with bare aluminum conductor or ACSR (aluminum cable, steel reinforced); by 1959, this figure had increased to 94.4 percent (GX 468). As the district court found, bare aluminum conductor "has practically displaced copper for use in overhead transmission lines" (App. A, 15a).

In the overhead distribution field, the primary application for insulated aluminum conductor, aluminum did not begin to make serious inroads upon copper until the early 1950's. The scarcity of copper during the Korean conflict, and copper's subsequent price increases (GX 467), quickly turned the electric utilities to aluminum. Thus, in 1950 only 6.5 percent of additions to insulated overhead distribution lines were of aluminum conductor, but by 1959 77.2 percent were being constructed with aluminum (GX 468). In the latter year, 61 million pounds of insulated aluminum conductor wire and cable were shipped by domestic producers (GX 436).

Accordingly, by 1958, the year prior to the merger, a substantial business had developed in the production of aluminum conductor wire and cable. Alcoa, though it no longer enjoyed the monopoly it had held at the end of World War II, remained the leading producer with 27.8 percent. The sharp decline in Alcoa's market share was in part the result of federal governmental programs. As an adjunct to the relief in the government's antitrust suit, and also to create needed additional capacity, Kaiser Aluminum and Chemical Corporation (Kaiser) and Reynolds Metals Company (Reynolds) were given various forms of assistance in constructing profitable enterprises in the primary aluminum field—including sales of Government surplus facilities at bargain prices, guaranteed supply contracts, and rapid tax write-offs. Olin Mathieson Chemical Corporation (Olin Mathieson) and Anaconda Wire and Cable Company (Anaconda)

were also beneficiaries of such tax write-offs. See *United States* v. *Aluminum Co. of America*, 91 F. Supp. 333, 353, *et seq.* (S.D.N.Y.); *United States* v. *Aluminum Co. of America*, 153 F. Supp. 132 (S.D. N.Y.). In 1958 Kaiser ranked behind Alcoa in aluminum conductor shipments with 23.1 percent; followed by Anaconda, 15.8 percent; Reynolds, 10.4 percent; General Cable Corporation, 6 percent; and Olin Mathieson, 4.5 percent. All of these except General Cable were producers of primary aluminum,[3] and the five integrated producers accounted for 81.6 percent of total aluminum conductor production. Four non-integrated producers—General Cable, Essex Wire Corporation (4.5 percent); Southwire Corporation (2.3 percent); and Rome (1.3 percent)—accounted for another 14.1 percent, leaving 4.3 percent for all others (GX 434).

In the field of insulated aluminum conductor, the pattern is similar. Kaiser, the largest, accounted for 26.8 percent in 1958; Anaconda, 16.9 percent; Alcoa, 11.6 percent; General Cable, 9.5 percent; Essex, 6.1 percent; Olin Mathieson, 5.3 percent; Reynolds, 4.8 percent; Rome, 4.7 percent; and Southwire, 2.5 percent. Thus the five integrated producers (Kaiser, Anaconda, Alcoa, Olin Mathieson, and Reynolds) accounted for 65.4 percent; the four listed independents accounted for another 22.8 percent. This left 11.8 percent for all others—twenty other producers, according to the court's findings—a number of whom

[3] General Cable is related, through stock ownership and common directors, to a primary aluminum producer (Tr. 1877, 1897–1900).

are but marginally in the field (compare GX 436 with AR 5).

As insulated aluminum conductor gained in popularity, Alcoa, which formerly had the entire aluminum conductor field to itself, found itself without the insulating skills necessary for full development of this market. At first, Alcoa hired insulating "know-how," through a 1952 tolling arrangement with Rome whereby the latter, which was just entering the insulated aluminum field, undertook to insulate or cover bare aluminum conductor supplied by Alcoa. In 1957, however, Alcoa began to fear that some of its competitors might be outdistancing it in the insulated aluminum field to the detriment of its entire aluminum conductor business. In that year Olin Mathieson acquired Southern Electrical Corporation, an independent wire and cable fabricator which in the previous year accounted for 8.1 percent of aluminum conductor wire and cable shipments and 6.1 percent of insulated aluminum conductor shipments (Fdgs. 47 and 48, App. B; GX 434, 436); and Kaiser acquired the Bristol, Rhode Island wire and cable plant of the U.S. Rubber Company.[3]

Alcoa believed its "No. 1 spot" in the aluminum conductor field to be endangered by Kaiser, especially after the Kaiser-Bristol merger (GX 161, GX 168). Though its business in insulated aluminum conductors was growing (4,349,000 pounds in 1955 and 5,970,000 pounds in 1958, GX 436), Alcoa could not offer customers a full line of its own insulated products, both

[3] The government has filed suit to invalidate this merger under Section 7 of the Clayton Act, Civil No. 2795, D. R.I.

aluminum and copper, as could certain of its competitors. In order to increase its insulated aluminum capabilities and develop insulated copper capacity, Alcoa considered both internal expansion and acquisition of a rival firm. Anticipating that the former course would present substantial difficulties and that five to ten years would be required before Alcoa would achieve its desired position (GX 161, Tr. 2026–2027), it decided to proceed by acquisition. In October 1957, it offered $24 million in Alcoa stock for Rome Cable Corporation (GX 165). In the words of one Alcoa executive:

> Rome Cable, with its fine personal [*sic*] and in general excellent "know-how", is by far the best acquisition, in my opinion, that Alcoa could hope to find. The step would be the answer to the present Kaiser threat to push Alcoa out of first place in the electrical conductor field. [GX 161.]

When Rome refused this offer, Alcoa attempted to acquire other independent wire and cable fabricators, but these efforts, too, came to nought (GX 398–406). By the fall of 1958, its plans for acquisition apparently having failed, Alcoa was prepared to expand on its own in insulated conductor; its president ordered the development of plans for "a rounded out program well beyond the neoprene stage * * * to keep us in the No. 1 spot in the aluminum conductor field and, if necessary, a sufficient factor in the copper field to help us maintain the No. 1 position in the aluminum field" (GX 168).

This program was never executed, for in early 1959 Alcoa's second attempt to acquire Rome proved successful. On March 31, 1959, 355,226 shares of Alcoa common stock (the value of which ranged in 1959 from $27 million to $47 million) were exchanged for all the assets of Rome (Fdg. 6, App. B; GX 16), and Rome has since been operated as a wholly-owned Alcoa subsidiary (Fdg. 4, App. B).[4]

3. Proceedings below

The government's complaint, filed April 1, 1960, charged that the acquisition violated Section 7 of the Clayton Act, because of its impact upon competition in various conductor and accessory product lines. Pending final adjudication on the merits, the district court enjoined Alcoa from encumbering the stock of its Rome subsidiary, and from further transferring operations from Rome to any other plants of Alcoa. At trial, the government claimed that the forbidden anti-competitive effect would be felt in ten "lines of commerce", but only two are involved in this appeal: aluminum conductor (consisting of both bare and insulated types) and insulated aluminum conductor.

After trial, in an opinion dated January 28, 1963, the district court dismissed the complaint. The court concluded that aluminum conductor and insulated aluminum conductor were not appropriate submarkets for assessing the impact of the merger, and that in

[4] The transfer was accomplished through the formation by Alcoa of a subsidiary corporation, the Rome Cable Corporation of Delaware, to which was transferred all of the assets, business and good will of the Rome Cable Corporation of New York. The New York corporation was thereafter liquidated.

any event the merger lacked the prohibited anti-competitive effect in any line of commerce.

In rejecting insulated aluminum conductor as a line of commerce, the court noted that it is functionally interchangeable with its copper equivalent, their respective purchase and use being dictated principally by economic factors, and that the insulated aluminum product is not recognized in the industry as a separate economic entity, has no distinct customers, and lacks specialized vendors (App. A, 15a–16a). Although finding that the aluminum and copper products sell at different prices and that these prices are not sensitive to one another, the court concluded that insulated aluminum conductor is "in actual competition with its copper counterpart", and therefore could not be considered a "line of commerce" (App. A, 16a). And since aluminum insulated is, along with bare aluminum, one of the two components which make up the aluminum conductor category, the latter, too, was denied the status of a "line of commerce" (*ibid.*).

Turning to the issue of competitive effect, the district court found that Alcoa's purpose in acquiring Rome was to secure the special competence which Rome had developed in the insulated cable field and which Alcoa admittedly lacked (App. A, 21a); that the concentration of about 80 percent of the aluminum cable market in the five integrated producers "loses its significance when it is realized that the production of aluminum and the fabricating of its products were concentrated to the point of a monopoly less than twenty years ago and has undergone a gradual decentralization by the entry of new producers and fabri-

cators since that time" (App. A, 22a–23a); and that acquisitions in the aluminum cable field by other integrated producers, which preceded and followed the Alcoa-Rome merger, do not constitute a "significant pattern or trend of merger", especially in view of the post-merger declines suffered by the merging parties. (App. A, 23a; Fdg. 46, App. B.)

The court found no serious barriers to entry in the insulated aluminum market, noting that the number of producers had increased in ten years from four to twenty-nine, and that most of the new entrants had come from the copper field (App. A, 24a). It also relied upon the absence of any complaints concerning the "actual or potential effect of the acquisition upon suppliers and purchasers," and upon testimony from certain aluminum cable competitors and purchasers that no adverse effect had been felt (App. A, 27a–28a). In addition, the court took into account the declining market shares held by Alcoa, both before and after the Rome acquisition,[5] a decline in the rate of return on Alcoa's invested capital, and an increase in number and market position of other primary aluminum producers and cable fabricators, concluding that Alcoa does not enjoy a "dominant" position.

[5] In 1958, the year prior to the acquisition, Alcoa had 27.8 percent of aluminum conductor wire and cable shipments and Rome 1.3 percent; in 1961, the combined Alcoa-Rome share was 24.8 percent. In 1958, Alcoa had 11.6 percent and Rome 4.7 percent of insulated or covered aluminum conductor wire and cable; in 1961, Alcoa-Rome accounted for 13.0 percent (App. A, 25a).

THE QUESTIONS ARE SUBSTANTIAL

1. This case presents an important question involving the application of Section 7 of the Clayton Act to a merger of substantial companies in an oligopolistic industry. The government's position is this: in an industry already characterized by a high degree of concentration, the acquisition by the leading company of one of its few substantial independent competitors is a violation of Section 7, for in that setting, the effect of such an acquisition necessarily "may be substantially to lessen competition." The district judge's contrary "finding" rested upon an erroneous interpretation of the statute, which this Court is free to correct.

A. In the case at bar, all of the elements which combine to spell out an offense under a correct interpretation are established by the record.

(a) *The industry is highly concentrated.* In 1958, the year before the merger, five vertically integrated aluminum companies accounted for 81.6 percent of the production of aluminum conductor wire and cable, and these companies, plus four independents (including Rome), accounted for 95.7 percent. Among the remaining companies whose production statistics appear in the record,* none produced as much as one percent. In the aluminum insulated line, the five

*The Central Cable Corporation supplied the Department of Justice no information on its shipments, either of aluminum conductors or aluminum insulated. It is believed, however, that this company, which was acquired early in 1963 by Aluminum Ltd. of Canada (*infra*, p. 18), was a substantial fabricator in both lines (Tr. 120–121, 712).

integrated companies accounted for 65.4 percent, and the top four independents whose production statistics appear in the record added another 22.8 percent. We may point out, by way of comparison, that in *United States* v. *Bethlehem Steel Corp.*, 168 F. Supp. 576, 584 (S.D.N.Y.), Judge Weinfeld found the iron and steel industry "highly concentrated" because twelve integrated producers accounted for 83 percent of industry capacity. And in *Brown Shoe Co.* v. *United States*, 370 U.S. 294, 300, this Court noted the district court's finding that a small number of shoe manufacturers "occupied a commanding position" in that the top four produced approximately 23 percent of the nation's shoes.

(b) *The acquiring company, Alcoa, was the leading producer.* Though it ranked third in the field of insulated aluminum conductor, with 11.6 percent of total production, Alcoa was the leader both in bare aluminum conductor, with 32.5 percent, and in aluminum conductor, generally, with 27.8 percent (GX 434–436; Fdg. 45(a), App. B). This is not a case in which two small companies combined in order to compete more effectively with larger corporations dominating the market. See *Brown Shoe*, 370 U.S. at 331. Indeed, the avowed purpose of the present acquisition was to protect that "No. 1 position" by securing for it the facilities, technical skills, and full product line which Rome had developed in the insulated field—assets and capabilities which it would have taken Alcoa five to ten years to develop through its own efforts.

(c) *The acquired company, Rome, was a thriving and substantial enterprise.* Rome, one of the five leading non-integrated fabricators of aluminum wire and cable products, shipped in 1958 products having an aluminum content of 2,948,000 pounds, 1.3 percent of the aluminum conductor total (GX 434); and its share of the insulated aluminum conductor market was 4.7 percent (GX 436). A pioneer in the field of aluminum insulation, Rome offered a broad line of high-quality wire and cable products, and its technical "know-how," experienced marketing organization, and active research program had earned it an outstanding reputation in the industry. In short, it was precisely the sort of competitive factor which Congress, in amending the Clayton Act, sought to preserve. See H. Rep. No. 1191, 81st Cong., 1st Sess., p. 8; *Brown Shoe Co.* v. *United States,* 370 U.S. 294, 321.

In these circumstances, the effect of Alcoa's acquisition of this important independent firm "may be substantially to lessen competition" within the meaning of Section 7. This conclusion is borne out by the legislative history of the 1950 amendment. According to the House Report, the forbidden effect of "lessening competition" may be demonstrated by a showing that the acquisition has eliminated an enterprise which had been "a substantial factor in competition." H. Rep. No. 1191, *supra; Brown Shoe, supra,* 370 U.S. at 321, fn. 36. There can be little doubt that Rome, one of ten companies whose share of the aluminum conductor market exceeded one percent, fits that description.

The dominant theme pervading the legislative history of the 1950 amendments to Section 7, as this Court explained at length in *Brown Shoe,* was the concern of Congress to stem what it considered to be a "rising tide of economic concentration in the American economy." *Id.* at 315. Congress sought to arrest the formation of further oligopolies "with their attendant adverse effects upon local control of industry and upon small business," and thereby to preserve an "economic way of life" in which numerous independent units might compete. *Id.* at 333. The acquisition of an important independent fabricator by the nation's largest producer of primary aluminum and aluminum conductors, in lines of commerce dominated by a small handful of such integrated producers, is plainly inimical to these legislative ends. In *Brown Shoe,* this Court affirmed the decision of the district court striking down a merger in the retail shoe industry, a highly fragmented line of commerce composed of 70,000 retail outlets, of which 22,000 were "shoe stores" in the ordinary sense (370 U.S. at 300); in many cities, the combined market share of the acquired and acquiring companies did not exceed 5 percent, and the effect of the acquisition was to give the acquiring company control over only 7.2 percent of the nation's retail "shoe stores." (*Id.* at 343, 345.) It would be strange indeed to find that Congress had barred acquisitions in fragmented industries on the ground that they might constitute a step on the road to oligopoly, yet at the same time

tolerated more substantial acquisitions the effect of which was further to consolidate the power of a dominant firm in an already oligopolistic industry structure.

Moreover, the present acquisition did not stand alone. It is worth pointing out, though not essential to our argument, that the absorption of this non-integrated fabricator was one of five such acquisitions by producers of primary aluminum since 1957. In that year, Olin Mathieson acquired the Southern Electrical Corporation, then the largest independent manufacturer of aluminum conductor (GX 434; Defendants' Answer to Plaintiff's Interrogatory (47-48); and Kaiser acquired the Bristol, Rhode Island, plant of the U.S. Rubber Company, one of the top ten in the insulated aluminum field. These moves, and the threat they were thought to pose, were specifically identified as factors influencing Alcoa's 1959 decision to acquire Rome (GX 150; GX 161; Tr. 2028-29.) And it was partly in response to the three prior acquisitions, that Reynolds, in 1961, acquired the wire and cable facilities of John A. Roebling's Sons Division of the Colorado Fuel and Iron Company, a small fabricator (GX 387, 396). Finally, in February 1963, too late to be noted in the record below, Aluminum Ltd. of Canada announced the acquisition of Central Cable Corporation, one of the largest of the independents (see p. 14, *supra*, fn. 6). As a result of this series of mergers, there now remain only four non-integrated fabricators[7] of aluminum conductor whose individual shares of total industry production (based on 1959 figures, the latest in the record)

[7] The four are General Cable Corp., Southwire Company, Essex Wire Corp., and Nehring Electrical Works.

amounted to more than one percent. And since Harvey Aluminum Company, another primary producer, is presently considering entry into the conductor field through the acquisition of an existing manufacturer (Tr. 873–874), it seems likely that the ranks of the independents will soon be further depleted, if the decision below is allowed to stand. In sum, the aluminum conductor industry is experiencing precisely that process of creeping concentration which the amended Section 7 was designed to thwart, and which was described in the Senate Report on the bill (S. Rep. No. 1775, 81st Cong., 2d Sess., p. 5, quoted in *Brown Shoe*, 370 U.S. at 333–334):[8]

> Under the Sherman Act, an acquisition is unlawful if it creates a monopoly or constitutes an attempt to monopolize. Imminent monopoly may appear when one large concern ac-

[8] The same point was stressed by Mr. Justice Douglas in his dissenting opinion in *United States* v. *Columbia Steel Co.*, 334 U.S. 495, 534–535: "This is the most important antitrust case which has been before the Court in years. It is important because it reveals the way of growth of monopoly power—the precise phenomenon at which the Sherman Act was aimed. Here we have the pattern of the evolution of the great trusts. Little, independent units are gobbled up by bigger ones. At times the independent is driven to the wall and surrenders. At other times any number of 'sound business reasons' appear why the sale to or merger with the trust should be made * * *. We have here the problem of bigness. Its lesson should by now have been burned into our memory by Brandeis. *The Curse of Bigness* shows how size can become a menace—both industrial and social. It can be an industrial menace because it creates gross inequalities against existing or putative competitors. * * *" It was *Columbia Steel* and its demonstration of the inadequacy of existing law to cope with mergers that spurred Congress to enact the 1950 amendment to the Clayton Act (see *Bowrn Shoe*, pp. 318–319, fn. 33).

> quires another, but it is unlikely to be perceived in a small acquisition by a large enterprise. As a large concern grows through a series of such small acquisitions, its accretions of power are individually so minute as to make it difficult to use the Sherman Act test against them * * *.
>
> Where several large enterprises are extending their power by successive small acquisitions, the cumulative effect of their purchases may be to convert an industry from one of intense competition among many enterprises to one in which three or four large concerns produce the entire supply. S. Rep. No. 1775, 81st Cong., 2d Sess. 5. And see H. R. Rep. No. 1191, 81st Cong., 1st Sess. 8.

B. Though the district court gave attention to many of the factors mentioned in *Brown Shoe*, it reached a result wholly at variance with the congressional policy explained therein. The court below did not dispute the underlying facts relied upon by the government, *e.g.*, that five integrated producers accounted for more than 80 percent of the aluminum conductor market; rather, its error lay in the failure to perceive that these facts themselves established that the effect of this merger may be substantially to lessen competition. Whatever may be the significance of the factors upon which the court relied (the principal ones of which are discussed below) in testing the validity of a merger of competitors in a less concentrated industry, they cannot serve to validate the elimination of one of the few remaining competitors in this oligopolistic market.

The court took the position—erroneously, we submit—that the government's concentration data were without significance because the production of aluminum and the fabricating of its products "were concentrated to the point of monopoly less than twenty years ago" and have "undergone a gradual decentralization by the entry of new producers and fabricators since that time." This overlooks completely the fact that it was action by the federal government, not the forces of the market, which broke up Alcoa's monopoly and brought about this "decentralization" (see pp. 7–8, *supra*). It would be a remarkable outcome if Alcoa's long history as a monopolist—a status which was judicially terminated only two years before this acquisition—were now deemed a mitigating factor.[9]

Similarly, the court noted that whereas there were four fabricators of insulated aluminum conductor in 1951, the number had risen to twenty-nine as of April 1, 1961 (App. A, 23a). This statistic loses significance, however, when it is observed that in 1959, the latest year for which figures are available, only eleven of the twenty-nine companies referred to by the court (listed in AR 5) produced as much as one percent of the insulated aluminum total;[10] only four others had

[9] In view of the fact that from 1945 to 1957 the scope of relief to be given in the government's antitrust suit against Alcoa had not been finally determined, and could have included divestiture or dissolution, it is not surprising, as the district court noted, that Alcoa had "no history of acquisitions or mergers" or of "forbidden anti-competitive practices" (App. A, pp. 23a and 29a).

[10] Ten companies, each accounting for one percent or more of the insulated aluminum total in 1959, are listed in GX–436. It is assumed that Central Cable Co., regarded in the industry

as much as two-tenths of one percent;[11] five others were, by the time of trial, out, or "almost completely out," of the field;[12] and five others did not make overhead conductors at all, but only specialty items.[13] A directory of producers shows only one fabricator in 1961 which was not also listed in 1955, other than those which acquired existing firms (GX–442). These facts also dispel the significance of the court's finding that there is "ease of entry" in this industry. The possible entry of new firms is important only if the character of the industry is such that new firms are likely to appear, and to become as important competitors as the firm being eliminated. In this industry, however, most of the newcomers have been able to acquire only inconsequential shares of the market. In such circumstances, it would seem that: (1) substantial firms are unlikely to venture into a field which holds such slim prospects of success; and (2) even if they do, they are unlikely to develop to a point where they will be effective substitutes for the firm whose independence has been terminated.

The court further "found" that the four acquisitions of aluminum conductor fabricators by primary aluminum producers (the fifth, by Aluminum Ltd. had not yet been announced; *supra*, p. 18) did not amount to a "significant pattern or trend of mergers" (Fdg. 46, App. B)—chiefly because the combined market

---

as a substantial producer, also produced one percent or more in that year. See fn. 6, *supra*.

[11] GX–436.

[12] Tr. 491–492, 433–434, 777–779, 799, 992–995.

[13] Defendants' Answer to Plaintiff's Interrogatories, Table II.

shares of the acquired and acquiring companies in each case declined after the merger (Fdg. 48; App. B). The short answer is that the significance of this series of acquisitions does not lie in short-run increases in the market shares of the particular acquiring companies, or even of integrated companies generally, but in the fact that each combination (except the Reynolds-Roebling) eliminated one of the few substantial independent competitors. In any event (as we have already observed, *supra*, pp. 17–18), in an industry already acutely concentrated, it is not essential that the government establish a "trend" toward further centralization in order to defeat a substantial merger. In such an industry a substantial merger would be unlawful even if the tide of concentration had receded.

The court below, having concluded that the concentration data were without significance, then went on to consider other factors mentioned in *Brown Shoe, e.g.*, the purpose of the merger (App. A, 21a), and the lack of evidence of specific injury to suppliers, purchasers or remaining independent fabricators (App. A, 27a). These factors are undoubtedly important in gauging the effect, particularly the incipient effect, upon competition of questionable mergers in fragmented industries. But they cannot vindicate this acquisition. In enumerating "some of the factors, relevant to a judgment as to the validity of a given merger" (370 U.S. at 316), this Court obviously did not intend that enumeration to be used as a mechanical checklist with which to total up points

for and against an acquisition. Not all of the factors mentioned by the Court are of equal weight; nor is their relative weight the same in all situations. Where, as in this case, an acquisition takes place in a highly concentrated industry (*Id.* at 322) and eliminates one of the few significant competitors therein, these facts alone demand the conclusion that industry competition may be substantially lessened.

2. This case also presents an important question as to the proper standards for defining the relevant product markets within which to examine the effects of an acquisition. The court below determined that bare aluminum conductor was an appropriate line of commerce. However, the court also determined that neither (1) insulated aluminum conductor nor (2) aluminum conductor was a "line of commerce" within the meaning of Section 7. In so concluding, it misapplied the guidelines laid down by this Court in *Brown Shoe* and rendered uncertain the criteria for resolving an issue which lies at the threshold of every Section 7 case.

In holding that insulated aluminum is not a submarket competitively distinct from its copper counterpart, the court below ticked off the "practical indicia" listed in *Brown Shoe,* noting that producers do not regard the aluminum product as "a separate economic entity"; that the same equipment and personnel can be utilized to produce either the copper or aluminum product; that both are sold to the same customers; that there are no specialized vendors; and that, as a technical matter, the insulated copper product can

be utilized wherever aluminum insulated is used. On the other hand, the court recognized that in the only application for which insulated aluminum cable is widely used—overhead distribution lines—the customers make their purchases solely on the basis of economic factors; that the aluminum product is sold at prices distinct from copper; and that there is little price sensitivity between them. These latter factors, however, which we regard as decisive, were dismissed by the court on the ground that they did not destroy the conclusion "that covered aluminum wire and cable is in actual competition with its copper counterpart and may not be found as a line of commerce herein" (App. A, 16a). Apparently, therefore, the court considered that a finding that two products are "in actual competition"—without considering the degree of competition—necessarily precludes a ruling that either constitutes a "line of commerce." This represents a clear misunderstanding of the *Brown Shoe* decision.

In *Brown Shoe* the Court carefully pointed out (370 U.S. at 325) that while the outer boundaries of the product market must be broad enough to embrace all reasonably interchangeable substitutes, within these boundaries there may exist well-defined submarkets which are themselves "lines of commerce." This means, obviously, that two or more products—*e.g.*, insulated aluminum cable and insulated copper cable—though sufficiently competitive to be grouped together within a single product market, may at the same time be sufficiently noncompetitive to be treated as distinct submarkets; in other words, that degree of competitiveness which serves to justify the inclusion of

several items in the same line of commerce does not necessarily preclude their division into separate lines. The district court plainly failed to appreciate this point, for it characterized (App. A, 16a–17a) as an "inconsistent position" the government's contention that "insulated aluminum wire and cable is a line of commerce and therefore competitively distinct from insulated copper but * * * that insulated aluminum and insulated copper constitute a single line of commerce." If the court's view were correct, the distinction drawn by this Court between broad product markets and lesser included submarkets would be completely obliterated.

Had the court applied the proper standard, it could not have failed to recognize insulated aluminum conductor as a line of commerce distinct from the copper product. For most purposes, insulated aluminum is so inferior to insulated copper that it enjoys virtually no commercial acceptance.[14] In the conduction of electricity in overhead distribution lines, however,

[14] For example, aluminum has no significant usage in underground cable (GX 468), telephone or communications cable (TR. 1910), automotive wiring (Tr. 395–96), appliance wire and other flexible conductors (GX 267, GX 378, Tr. 398, 495–96, 1912), switchboard cable (Tr. 774–75), portable power cable (GX 375, Tr. 773), control cable (Tr. 773–74), fine wire (Tr. 772, 799, 1910–11), shipboard cable (Tr. 770–71), magnet wire (AR 18, Tr. 399, 798–800, 1226), missile cable, transformer wiring, instrumentation cable, street lighting cable, machine cable, signal cable, dredge cable or radio hook-up wire (AR 18, Tr. 1226). In the field of building wire, aluminum has achieved only a very limited acceptance, largely confined to the larger sizes of building wire in very large buildings. It is not considered as a significant factor in the building wire market (Tr. 399, 419, 492–94, 770).

aluminum has gained wide acceptance. In that application it is functionally interchangeable with insulated copper, but enjoys a decisive economic advantage because primary aluminum is much cheaper than primary copper and, pound for pound, will carry twice as much electricity. Consequently, aluminum has dramatically displaced copper in insulated overhead distribution lines; its share of total annual installations has increased from 6.5 percent in 1950 to 77.2 per cent in 1959 (the last year for which statistics were available at the trial) (*supra*, p. 7). As of the date of the merger, therefore, "actual competition" between the two metals in the field of overhead distribution was rapidly disappearing—just as it had already disappeared in the field of overhead transmission, where bare aluminum, having almost completely displaced bare copper, was conceded by Alcoa and found by the court to be a distinct line of commerce. It is axiomatic that Section 7 demands an assessment of future, as well as present, conditions of competition. *Brown Shoe*, 370 U.S. at 332–333.

To the extent that it still exists, competition between the copper and aluminum insulated conductor is extremely tenuous. Utilizing a high-cost metal, fabricators of insulated copper cable are powerless to eliminate the price disadvantage under which they labor and thus are not in a position to compete effectively in the overhead distribution field. Furthermore, so wide is the price differential between the two insulated products that a relatively large increase in the price of aluminum conductor would be necessary before a significant number of customers would shift

back to copper.[15] Accordingly, the availability of a copper substitute exerts little, if any, restraint upon the power of the aluminum cable manufacturers to raise the price of their product. In light of these considerations, it seems clear that insulated aluminum wire and cable is a realistic and economically significant submarket within which to appraise the impact of the acquisition upon competition.

It necessarily follows that aluminum conductor is a relevant market. Plainly, it accords with the commercial realities of the electrical industry to combine the bare and insulated types of cable in the same line of commerce, since both are used for the same broad purpose of conducting electricity, and both are sold to the same customers, the electrical utilities. And indeed the court so found (Fdg. 31, App. B). There remains only the question whether aluminum conductor can be separated from copper conductor. The same physical characteristics and cost considerations which differentiate the two insulated product lines also differentiate the broader conductor lines. Having found that bare aluminum is a distinct submarket, the court denied that status to aluminum conductor only because it determined the other component—insulated aluminum—to be inseparable from its copper equivalent. Since that premise is unfounded, there

[15] As of January 1, 1961, the prevailing price of a representative size of polyethelene insulated aluminum weatherproof wire was $73.50 per thousand feet; polyethelene insulated copper of equivalent conductivity cost $115.83. Comparable figures for a representative polyethelene insulated service cable were: aluminum $114.00; copper $206.00. (Defendants' Answer to Plaintiff's Interrogatory 61.)

can be little doubt that aluminum conductor, like its two components, is a distinct line of commerce.

Contrary to the district court's belief, *Brown Shoe* is no barrier to these conclusions. There the appellant's contention was that the district court had erred by delineating the relevant submarkets (men's shoes, women's shoes, and children's shoes) too broadly and should instead have subdivided them further on the basis of price and quality differences. It was in response to that contention that this Court made the statement, cited by the court below (App. A, 16a), that the boundaries of the relevant market must be drawn with sufficient breadth to include all competing products. By this statement, the Court indicated its approval of broad lines of commerce encompassing all reasonably competitive substitutes, but it did not thereby rule out less inclusive submarkets as well. This is not to say that the Court would have sanctioned further subdivision of the market in *Brown Shoe* itself; on the contrary, it characterized as "unrealistic" Brown's contention "that, for example, men's shoes selling below $8.99 are in a different product market from those selling above $9.00." (*Id.* at 326.) Thus the Court pointed up the lack of realism in any effort to put shoes into different "lines of commerce" where the difference in price might be as little as one cent per pair. In sharp contrast, insulated aluminum wire and cable, used in overhead distribution, is significantly cheaper than its copper equivalent. In most cases, insulated aluminum distribution cable sells at 50 percent to 65 percent of the price of the copper counterpart (Defendants' Answer

to Plaintiff's Interrogatory 61). Moreover, the purchaser of shoes selects among available alternatives with an eye not only to price but also to quality, style, and the intangible factor of how much of his income he chooses to spend on shoes; hence, two consumer products may be highly competitive, though disparate in cost. By contrast, a public utility's selection between insulated aluminum and insulated copper cable for use in overhead distribution lines is based almost exclusively on economic considerations, so that any significant differential in price is bound to reduce drastically the degree of competition, as in fact it did here. To put price to one side, as the district court did, is to ignore the single most important practical factor in this business—a result surely not consonant with this Court's decision in *Brown Shoe*.

CONCLUSION

The questions presented by this appeal is substantial and of public importance. Probable jurisdiction should therefore be noted.

Respectfully submitted.

APPENDIX A

United States District Court
Northern District of New York

Civil No. 8030

UNITED STATES OF AMERICA, PLAINTIFF

against

ALUMINUM COMPANY OF AMERICA AND
ROME CABLE CORPORATION, DEFENDANTS

ANTITRUST ACTION—VIOLATION OF SECTION 7,
CLAYTON ACT

Tried Feb. 5–Mar. 1, 1962; Submitted Aug. 18, 1962;
Decided Jan. 28, 1963

Opinion

BRENNAN, *Judge:*

This is a civil antitrust action brought by the United States against the Aluminum Company of America, hereinafter referred to as "Alcoa" and the Rome Cable Corporation, hereinafter referred to as "Rome" to annul the acquisition by Alcoa of the stock and assets of Rome.

The complaint in this action was filed April 1, 1960 and charges that the acquisition, above referred to, is in violation of Section 7 of the Clayton Act, 15 U.S.C. § 18. The complaint seeks the usual relief in this type of case—to wit: an order of divestiture and injunction against further acquisitions and such other and further

relief as may be just and proper. Defendants' answers, while admitting certain allegations of the complaint, deny that the transaction involved is in violation of the statute. No question is raised as to the jurisdiction of this court.

On March 31, 1959, pursuant to a prior agreement, Alcoa acquired all of the assets of Rome by an exchange of stock of the two corporations. Title to the assets of Rome was taken in a newly formed corporation also known as the Rome Cable Corporation. The new company is a wholly owned subsidiary of Alcoa and, since the acquisition, has been operated as a division thereof. The crux of the litigation arises from plaintiff's contention that the effect of such acquisition may be substantially to lessen competition or tend to create a monopoly in certain lines of commerce consisting principally of wire and cable products—all in violation of Section 7 of the Clayton Act.

Brief reference is made at this point to the defendants and the general nature of their business activities in order to afford an insight into the more detailed discussions to follow.

Alcoa is a fully integrated aluminum producer. In the manufacturing process, it refines aluminum bearing ore into primary aluminum and converts same into intermediate and various aluminum end products. It manufactures such products in several states and sells and ships same in various forms throughout the United States and in foreign countries.

Rome was incorporated in 1936. It was and is primarily engaged in the manufacture of wire and cable products in which copper was and is the predominant metal used in its operations. In 1952 Rome installed equipment for the manufacture of aluminum rod from aluminum ingot purchased from primary producers. It began producing such rod for its own use in 1953.

Thereafter it began to manufacture and sell certain types of aluminum wire and cable in addition to its broad line of copper products.

THE LAW

Before proceeding to discuss Alcoa's and Rome's position in the markets in which they are active participants, it would seem logical to refer briefly to the legal principles involved. An understanding of the language and purpose of the statute is essential as an approach is made to the decision which must necessarily involve the recognition of the prohibitions imposed and the application of same to the facts disclosed.

The basis of this action rests upon the provisions of Section 7 of the Clayton Act, 15 U.S.C. § 18, the relevant part of which is quoted below.

> No corporation engaged in commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no corporation subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of another corporation engaged also in commerce, where in any line of commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly.

The language of the above statute, taken alone, poses problems both in its construction and application. The courts have proceeded upon a case-to-case basis to construe and apply the statute to the facts of a particular litigation. It seems fair to state that the law involved is still in a state of development and that no formula, possessing rigidity, may be applied. This is necessarily so since the statute deals with reasonable probability in the constantly changing economy in which we live.

The recent decision of the Supreme Court in *Brown Shoe Co.* v. *U.S.*, 370 U.S. 294, is, as stated therein, the first case coming before that court wherein an analysis of the scope and purposes of the statute, as it now exists, was necessary to the issue raised. It would seem to follow that reference to the holdings in that decision would be more profitable than to discuss how far the previous landmark decisions under the Sherman Act are applicable or to reconcile or distinguish decisions of circuit and district courts which had decided Section 7 cases prior to the *Brown Shoe* decision. The most often quoted decisions, referred to above, are either cited or are found in the notes in the Brown Shoe opinion and their application may be gathered from the text thereof.

The legislative history of the statute is discussed in the above *Brown Shoe Co.* decision and does not require repetition here. Such discussion appears to confirm some previously stated purposes of the statute and sets at rest certain controversies relative to the meaning and application thereof. This court's understanding thereof is summarized below and the quotations therein are, unless otherwise indicated, taken therefrom.

Congress considered that ". . . a rising tide of economic concentration in the American economy" was an evil to be curbed. Effective competition and the protection of small businesses were results to be accomplished. The statute was intended to supply a deficiency in the existing statute and to apply to all types of mergers. Its purpose was to curb monopolistic acts at their beginnings or incipiency rather than await their fruition and the standards for judging their legality are broader than, but may include, those applied in Sherman Act violations. All mergers however are not to be condemned. Con-

demnation is limited to those having "demonstrable anticompetitive effects" although such demonstration is satisfied by a probability. Certainty is not required. Proof of probability is sufficient provided the menace to competition is clear-cut as distinguished from a temporary condition or an "ephemeral possibility". No particular tests are provided in the statute to measure either the product or geographic market. Neither are qualitative or quantitative tests controlling in measuring the effect of a merger. Both measurements must be made in the light of all the relevant factors which may vary in accordance with the facts of the particular acquisition under consideration.

In addition to the above summary of the discussion of the legislative history as gathered from the opinion in the *Brown Shoe* case, the decision therein, in its holdings seems to otherwise clarify the vagueness of the language of the statute and afford something of a guide to the trial courts in their application to the facts of the litigation before them.

The lines of commerce or product market may consist of both broad and submarket lines. No rigid formula exists for their determination. The realities of competition are the ultimate test. The broad market line may be extended to cover a product where there exists "the reasonable interchangeability of use or the cross-elasticity of demand between the product itself and substitutes for it". Seven "practical indicia" are set forth as factors to be considered in determining the boundaries of a submarket. They are (1) industry or public recognition of the submarket as a separate economic entity, (2) the product's peculiar characteristics and uses, (3) unique production facilities, (4) distinct customers, (5) distinct prices, (6) sensitivity to price changes, and

(7) specialized vendors. The existence or non-existence of each of the above indicia is not determinative of the problem in itself. All relevant facts must be considered and we are admonished "to recognize competition where in fact competition exists". Peculiar characteristics and uses may be one of such indicia but it is not determinative. To be of effective weight, they must be so peculiar as to render the product "non-competitive".

In determining the impact of the merger, the size of the share of the market foreclosed is not decisive unless it approaches monopoly proportions or is of de minimus effect. The market shares held by the merged companies are an index of market power to be applied in all aspects of the realities of competition in "an economically significant market". Mergers may not be condemned per se upon the basis of such shares alone; same "will seldom be determinative". The purpose of the merger is a most important factor as is the existence of trends toward concentration in the industry. The testimony of those engaged in industry has its weight and significance although "It is competition, not competitors, which the Act protects". An evaluation of the competitive realities disclosed, based upon a pragmatic factual approach, would seem to be the obligation of the trier of the facts.

THE INDUSTRY

The litigation involves principally the effect of the merger as tending to lessen competition in certain aluminum product lines of commerce. In the decision of *Brown Shoe Co. Inc.* v. *U.S., supra,* at 321, we find the following quotation: "* * * Congress indicated plainly that a merger had to be functionally viewed, in the context of its particular industry" and at

page 329 the court refers to the examination of "economic and historical factors" as necessary to the decision. It follows that the facts must be weighed and the law applied with some understanding of the industry as a whole and the status of both Rome and Alcoa therein.

The history of the aluminum industry in this country from its beginning to World War II is for all practical purposes a history of Alcoa itself. The economic demands of World War II account for the entry of competing primary aluminum producers, the details of which may be gathered from the lengthy court decisions which involve the position of Alcoa in the business of aluminum production and the sale of aluminum products within the United States. Such details may be gathered from the decisions—*U.S.* v. *Alcoa,* 44 F. Supp. 97; *U.S.* v. *Alcoa,* 148 F. 2d 416; *U.S.* v. *Alcoa,* 91 F. Supp. 333; and *U.S.* v. *Alcoa,* 153 F. Supp. 132. It is sufficient to say that principally due to government action during the above period, Reynolds Metal Company and Kaiser Aluminum and Chemical Corporation shared with Alcoa, then and now, a place in the aluminum industry as fully integrated aluminum producers.

The above corporations are described in their activities as fully integrated in that their facilities permit the processing of the necessary materials from the mine through the intermediate stages to the finished aluminum product. Statistics appear to be first available in the above process when same reaches the primary aluminum stage, so that for all practical purposes we are not particularly concerned with the status of industry prior to the production of primary aluminum. Three additional corporations have since 1955 joined Alcoa, Kaiser and Reynolds as such producers. These corporations—Ormet, Inc. (Olin

Mathieson), Harvey Aluminum Company and Anaconda Aluminum Company, although not as fully integrated as Alcoa, Kaiser and Reynolds, are producers of primary aluminum. The above corporations are in a position to manufacture and sell aluminum billet, pig, ingot and rod which are termed intermediate products. Each of the above corporations, except Harvey, fabricates the intermediate products into numerous finished merchantable items, intended directly for consumer use. Included in such items are the wire and cable products urged as proper lines of commerce in this case. The five above companies, thus engaged in processing intermediate aluminum products, are considered as "integrated producers" as the term is used in this litigation.

An indication of the status of the above companies engaged in producing primary aluminum may be gathered from the exhibit set out below—

Aluminum Ingot Capacity Existing or Under Construction at the End of 1960
[Short tons]

Company	Capacity	Percent of U.S. total
United States total	2,635,750	100.0
Aluminum Company of America	1,025,250	38.6
Reynolds Metals Company	701,000	26.4
Kaiser Aluminum & Chemical Corp	609,500	23.0
Ormet, Inc.	180,000	6.8
Harvey Aluminum	75,000	2.8
Anaconda Aluminum Company	65,000	2.4

The above percentage of total capacity of Alcoa differs slightly from that provided by the defendant which is set at 35%. This may be accounted for by the fact that Alcoa abandoned construction of a plant in Indiana when it was apparent that there was an oversupply of capacity. No doubt production figures are more meaningful than the above since it appears that 15% of Alcoa's primary aluminium capacity was

unused in 1960. Alcoa's percentage of United States primary aluminum for 1960 was 36% of the total supply, having declined 9% from 1956. That Alcoa's percentage of such production has declined over a period of years is self-evident from the entry of new producers as indicated above but it would seem to be fair to say that the three principal producers supply around approximately 80% of such production. The record is indicative of a further increase in domestic aluminum capacity and production, both from the documentary evidence and the oral testimony. This increase would come about by entry of new producers and the increase in production capacity of Alcoa's present competitors.

Only brief reference need be made to the copper industry since it is involved only to a limited extent in this controversy. Copper products are manufactured from an ore from which intermediate products are refined and the end product eventually produced for consumer use. Like aluminum, there are companies which are so integrated as to be able to refine and produce copper products from the original ore to the finished items. Such companies sell intermediate products, such as ingot, to processors or fabricators, who then process same for ultimate use in their final form. There is no contention here that the merger involved has anti-competitive impact in the copper industry as a whole or upon the integrated copper producers or fabricators. No further discussion of the copper industry appears to be necessary.

We now turn to a brief discussion of the industry as it pertains to the particular lines of commerce involved in this litigation. The lines of commerce which are principally litigated here consist of those products capable of conducting electricity and are generally referred to as wire and cable products.

While it is claimed that some of such lines involve both aluminum and copper, emphasis is placed principally upon aluminum wire and cable which are the end products of processing or fabricating an intermediate aluminum product such as ingot into the completed wire and cable which may be of various sizes, electrical conductive capacity and of different weight, size and strength.

There are a large number of firms engaged in the fabrication of wire and cable copper products. There are a lesser number of such fabricators engaged in the business of fabricating aluminum products. As the word "fabricators" is used in this litigation, it is distinguished from the integrated aluminum and copper producers who also fabricate and sell their end products. Upwards of two hundred fabricators are engaged in the manufacture of both aluminum and copper wire and cable products. There is a vigorous competition as to wire and cable between the integrated companies among themselves and between those fabricators whose process of manufacture begins with the intermediate product purchased from a primary aluminum producer. This active competition is also evident as between aluminum and copper wire manufacturers whose product may be used interchangeably. In other words, there is a lively competition between aluminum and copper products in certain areas which is accounted for by the increasing use of aluminum products and the economic factors which apply thereto. Both the aluminum and copper industries are important factors in the present day economic and business life. They maintain effective and costly research departments designed to improve the efficiency of their products and to create new uses therefor. Both the copper and aluminum industry must meet competition at the intermediate manufac-

turing stage from foreign countries or concerns. Canada produces primary aluminum equal to about 35% of the total United States production and supplies a significant portion thereof which is available to this country's fabricators. European producers apparently furnish a small portion of primary aluminum for the use of American fabricators. In view of the above, no shortage in primary aluminum is foreseeable.

THE STATUS OF ALCOA AND ROME IN THE INDUSTRY

Since Alcoa has not been engaged in the manufacture of copper products, its place in the industry, above described, is limited to the production, manufacture and sale of aluminum products. Its position in the aluminum industry is to some extent apparent in the above discussion.

Alcoa still maintains its position as the leading producer of primary aluminum. Its share in that market, as may be expected, has declined sharply since the entrance of competitors in that field. This decline has been reasonably consistent since the newcomers in the field reached productive capacity. In 1948, Alcoa had 52% of United States primary aluminum production. It declined to 45% by 1956 and from 1956 to 1960, it declined to 36%. Its percentage of primary aluminum capacity has declined substantially in the same manner.

Alcoa manufactures and sells a variety of aluminum products. This litigation however involves primarily wire and cable products so that reference to its position in the market will be limited thereto. Alcoa pioneered the use of aluminum as an electrical conductor and sold substantially all of the aluminum cable used for electrical transmission in the United States prior to World War II. Since that time,

Alcoa has encountered increased competition and its relative participation in the above market has declined materially. Its principal products in that field are bare aluminum cable and ACSR (aluminum covered steel reinforced). ACSR is a bare aluminum cable with a steel core primarily used by utilities in the overhead transmission of electric current. Alcoa's share in ACSR and bare aluminum cable declined from 48.4% in 1954 to 32.5% in 1958 and to 26.1% in 1961. Its second principal product is known as aluminum conductor wire and cable. Its share in that product declined from 42.8% in 1954 to 27.8% in 1958 and to 23.5% in 1961. The decline in the above market percentages is reasonably consistent between the dates above mentioned and continuing since the acquisition. Alcoa's third such product is known as aluminum wire and cable, insulated or covered. Its share in that item varied from 10% in 1954 to 11.6% in 1958 and to 7.3% in 1961. The comparatively recent increase in demand for covered or insulated aluminum conductor wire found Alcoa in an unfavorable market position. It manufactured line wire and multiplex cable with a polyethylene insulation or covering but it lacked the know-how and the facilities for the manufacture of the more complicated line of insulated aluminum wire and cable products.

In March 1952 Alcoa and Rome entered into a continuing agreement referred to as a "tolling agreement" whereby Rome would cover or insulate bare aluminum wire with the more complicated insulated constructions. This arrangement broadened the scope of Alcoa's ability to provide insulated wire products to its trade.

As already indicated, Rome was primarily the manufacturer of copper products, including wire and cable. It has been successful in its manufacturing efforts

and expanded same so that at the time of its acquisition it had plants at Rome, New York; Torrance, California; and Collegeville, Pennsylvania. It maintained an active and efficient research department and sales organization. Prior to its acquisition by Alcoa, Rome was one of the ten largest manufacturers of copper conductor wire and cable in the United States. In 1952, Rome installed equipment for the manufacture of aluminum rod from aluminum ingot purchased from primary producers. It began producing such rod for its own use in 1953. Thereafter it began to manufacture and sell certain types of aluminum wire in addition to its broad line of copper products. In the course of its experience and research, Rome developed a special aptitude or skill in the matter of insulating wire and cable. It manufactured a relatively full line of the more complicated insulated wire and cable, designed and built to meet customers' requirements. This skill prompted the so-called "tolling arrangement" between Alcoa and Rome, referred to above.

At the time of the merger, here under consideration, only five products were manufactured and sold by both Alcoa and Rome and their direct competition in the market was limited thereto. These products may be identified as follows—(1) ACSR and bare aluminum cable; (2) covered line wire or weather-proof; (3) multiplex cable; (4) conduit; (5) aluminum redraw rod. The market shares of Rome and Alcoa in these competitive products, generally speaking, were not great and a further discussion of same may better be considered in the discussion of the impact of the merger upon or within the competitive market.

In this type of action, a burden is imposed upon the plaintiff to establish three essential elements, listed below, in order to establish a violation of the statute.

(1) The relevant products markets or "lines of commerce"; (2) the geographic markets within which the impact of the merger may be measured as to each such line of commerce; and (3) the substantial lessening of competition or tendency to create a monopoly in any such line of commerce in the relevant geographic area. The proof as to these elements will be discussed in the order in which they are mentioned above.

LINES OF COMMERCE

The Government offers proof as to ten lines of commerce and contends that each has been established thereby as applicable in this action. The defendants agree that four such lines of commerce are appropriate and disputes the relevancy of the remaining six lines and the sufficiency of the proof to establish same. There is set out below the list of specific products as contended by plaintiff, showing which are agreed upon and those in dispute. The position in which they appear below follows the order of the proof and the order in which they are discussed in the submitted briefs.

Item 1.	Aluminum conductor wire and cable	In issue.
Item 2.	Bare aluminum cable and ACSR	Agreed.
Item 3.	Insulated or covered aluminum wire and cable	In issue.
Item 4.	Aluminum ingot and rod used in the production of aluminum conductor wire and cable.	In issue.
Item 5.	Conductor wire and cable (aluminum and copper)	Agreed.
Item 6.	Conductor wire and cable, bare (aluminum and copper),	In issue.
Item 7.	Wire and cable, insulated and covered (aluminum and copper).	Agreed.
Item 8.	Service drop cable (aluminum and copper)	In issue.
Item 9.	Conduit (aluminum and steel)	Agreed.
Item 10.	Aluminum conduit	In issue.

The Government relies in its brief upon the peculiar characteristics and uses test as the bases upon which a finding of the relevant lines of commerce may rest. This test may find support in such deci-

sions as *A. G. Spalding & Bros. Inc.* v. *F.T.C.*, 301 F.2d 585; *Crown Zellerbach* v. *Federal Trade Commission*, 296 F. 2d 800; and *U.S.* v. *Bethlehem Steel Corp.*, 168 F. Supp. 576, but by the decision in the Brown Shoe case, such test is but one of seven of the "practical indicia" which may serve as a guide in determining submarket lines. Even if so used, such characteristics and uses must be such as to render the product "generally non-competitive".

The consideration and determination of the lines of commerce issue is made having in mind the discussion of the problem in the *Brown Shoe* case and the rules or guides laid down therein and referred to above.

Items 1, 2 and 3 are generally referred to herein as the aluminum conductor lines and are so related as to be discussed together.

Since Item 1 is a rather broad line and is simply a combination of Items 2 and 3, the latter two should first be determined. Item 2, bare aluminum cable and ACSR, is a heavy cable product which has practically displaced copper for use in overhead transmission lines. It is agreed that same constitutes a line of commerce here.

Item 3, insulated or covered aluminum wire and cable, is not a line of commerce because it is not recognized in the industry as a separate economic entity. While differing in some characteristics and preferred uses from its copper counterpart, they both perform the same functions and it is not "generally non-competitive" with copper. The Government's evidence shows in 1959 that insulated copper conductor comprised 22.8% of the gross additions to insulated overhead distribution lines. Both aluminum and copper wire may be produced interchangeably, using the same facilities. Covered aluminum wire has no

distinct customers as distinguished from covered copper wire purchasers. Neither has it specialized vendors. Insulated aluminum and copper wire are generally functionally interchangeable. Their purchase and use are likewise principally dictated by economic factors. While aluminum wire and cable is sold at prices generally distinct from copper and does not have the same price sensitivity, these factors do not destroy the conclusion that covered aluminum wire and cable is in actual competition with its copper counterpart and may not be found as a line of commerce herein. A different conclusion would ignore the admonition, "But the boundaries of the relevant market must be drawn with sufficient breadth to include the competing products of each of the merging companies and to recognize competition where, in fact, competition exists".

Since Item 1 is a broad line embracing both Items 2 and 3 and Item 3 is held not to be a proper line of commerce, their combination cannot result in a line of commerce. To find that Item 1 is a line of commerce extends the outer boundaries of the market beyond its legal limits because covered copper wire and cable is interchangeable in use and there is cross-elasticity of the demand therefor between insulated or covered aluminum and copper. To constitute a proper line of commerce, same must include the substitutes therefor which are reasonably interchangeable in use and for which there is a cross-elasticity of demand.

The above conclusion is fortified by the inconsistent position taken by the Government, at least as far as the vertical aspect of the merger is involved. The plaintiff contends here that insulated aluminum wire and cable is a line of commerce and therefore competitively distinct from insulated copper but agrees as to Item 7 that

insulated aluminum and insulated copper constitute a single line of commerce.

Item 4, aluminum ingot and rod, used in the production of aluminum conductor wire and cable is simply a grade of aluminum generally referred to as E.C. (electrical conductor). It is but one of 173 recognized aluminum alloys which may be manufactured interchangeably at the will of the producer. All six integrated primary aluminum producers produce various of such alloys including aluminum of E.C. grade which is required by industry standards to contain a minimum aluminum content of 99.45%. Generally the standard is met by the addition of a small percentage of boron to "a high purity pig". The purifying boron however may be added to the ingot during the course of the fabricating process. The rod represents a further product in the reduction of the ingot to the desired wire or cable size. It results from a continuing casting and rolling process and assumes a form or shape which is the starting point for most wire fabricators in their operation.

Although it may be doubtful that ingot and rod of the E.C. grade should be fragmented from the many aluminum alloys, it seems that it satisfies the most of the indicia laid down by the *Brown Shoe* decision and will be found as a line of commerce in this action.

Items 5, 6, 7 and 8 are generally referred to as conductor lines. They embrace both aluminum and copper wire and cable as distinguished from the four items discussed above which involve aluminum conductor only.

Item 5, conductor wire and cable (aluminum and copper), is a broad line covering all such products whether bare or insulated. Both litigants have agreed that same, together with Item 7, wire and cable, insulated and covered (aluminum and copper), may also be considered as a line of commerce here.

The first dispute arises when the defendants contend that the broad line, referred to above, may not be broken down by separating therefrom, as a separate line, Item 6, conductor wire and cable, bare. The court adopts such contention and holds that Item 6 does not constitute a proper line of commerce. Such a grouping would include bare aluminum wire and cable and ACSR. The Government has already asserted and agreed that such products are not competitive with copper or interchangeable therewith. In fact, these products are used in the overhead transmission field to the practical exclusion of copper. Grouping them together in Item 8 does not define a single product market. The Bureau of the Census has established separate product classifications for bare copper and for bare aluminum wire and cable. Because a broad line of commerce may be proper does not mean that it may be broken down into all possible fragments.

The proof as to Item 8, service drop cable (aluminum and copper), asserted by the Government as a line of commerce, is rather confusing. As so urged, it is referred to as multiplex cable and consists of one or more insulated conductors twisted around a cable or uninsulated conductor. This contention seems to again recognize that insulated aluminum is not competitively distinct from insulated copper wire and cable.

The product is or can be made by any manufacturer equipped to produce insulated wire or cable and is simply a separation of a particular item from the many other insulated products. Its use is primarily to carry electricity from the distribution point of the utility to the home or business place of the user and as secondary distribution lines carrying no more than 600 volts. The most popular type is of triplex construction and same is displacing open wire or weatherproof wire as a more popular product for service

drop, especially in new construction. The evidence is inconclusive as to amount of product known as service drop as distinguished from its use for other purposes including secondary distribution. As just indicated, weatherproof wire is still used as a service drop product from the utility pole to the entrance of the user's premises. No reliable data is available as to the extent of such use at the times relevant here. Two other types of cable, known as type "K" and type "SD" are presently used for the above purpose in particular localities. It would seem that to constitute a line of commerce, the substitutes for multiplex cable for secondary distribution use, weatherproof and the two types of cable, referred to above, may not be eliminated from consideration as a part of the service drop product line. Their absence, together with a consideration of the indicia, referred to herein, leaves the proof something less than convincing. If a product line is designated in terms of function, it must include all competitive substitutes accomplishing the same result. The Item is held not to be a relevant line of commerce herein.

THE GEOGRAPHIC MARKET

The litigants have agreed that in respect to all of the above lines of commerce, whether or not allowed as such herein, the United States as a whole constitutes a section of the country within the contemplation of Section 7 of the Clayton Act.

Item 9, conduit (aluminum and steel), has been agreed upon as a line of commerce. This item includes both rigid conduit and electrical metallic tubing (EMT). It is simply a metallic enclosure to protect lines or cables carrying electric current from outside injury or harm.

Controversy again arises in the matter of the Government's contention that the above broad conduit line may be separated by a submarket line of aluminum conduit alone. The contention is based principally on the separate characteristics and uses test. This single test, as indicated above, is not conclusive; in fact it is not applicable where such characteristics and uses do not render it generally non-competitive. Here the great weight of evidence is to the effect that aluminum and steel conduit are in direct and vigorous competition for the consumer trade. They are functionally interchangeable; alternate quotations are frequently sought by consumers and they react or are related in price change to each other. Aluminum conduit, taken alone, fails to meet the majority of the prescribed tests as a separate submarket and the contention of plaintiff that Item ten is a relevant line of commerce is rejected.

THE GEOGRAPHIC MARKET

There is no dispute but that the United States as a whole is an appropriate section of the country in which the impact of the merger may be considered as to both steel and aluminum conduit and aluminum conduit alone. The Government claims however that eleven western states (Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming) also constitute an appropriate geographic market for both of the above products. The claim is based upon the fact that the greater portion of Rome's total sales of conduit prior to the merger was made to customers within that area. The above statement is also true as to sales made after the merger. The evidence fails to show that such sales were made in that area as a particular market. Rome's sales expanded from a six state area

to a fourteen state area. The above eleven state area was used because data within same was available for comparison purposes. The evidence shows that freight rates and commercial realities are such that outside or eastern producers can ship conduit within the eleven state area and compete effectively with western producers.

In other words the purchaser within that area can turn for supplies to a producer located in any section of the country. *Tampa Electric Co.* v. *Nashville Co.*, 365 U.S. 320 at 327. The eleven state area is rejected as a proper geographic market in which to measure the impact of either conduit lines of commerce.

THE COMPETITIVE EFFECT OF THE ACQUISITION

The competitive effect of the acquisition upon the relevant lines of commerce, referred to above, is not determined in accordance with a rigid formula. Guides are furnished in the *Brown Shoe* decision and the cases cited therein. Reference will be made to those which seem to be pertinent here and will be applied to all claimed lines of commerce whether or not allowed as above.

Purpose

The "nature and purpose of the arrangement" is referred to as a most important factor and will first be discussed since it necessarily involves the participants' competitive problems and something of the background of the defendants previously referred to herein.

Alcoa was the prime mover in bringing about the acquisition. Its share in the aluminum market had declined as referred to herein. Its return on invested capital had declined from 9.3% in 1950 to 3.7% in 1961. It admittedly lacked the "know-how" to manufacture the more complicated types of insulated wire and cable for which there was a growing demand. Its principal

wire and cable product was ACSI. and bare aluminum cable. The need for product diversification was apparent. Rome was known to Alcoa as a substantial organization with special competence in the insulating field. The time required to obtain such competence from within its own organization and the expense involved seemed to foreclose such a program. Rome was first approached and negotiations failed. An engineering company was retained to explore the market to obtain an organization which would furnish the "know-how" in the insulated wire and cable field. Negotiations were reopened with Rome and the acquisition followed. Competition between Rome and Alcoa was limited to four wire and cable products. Rome's production thereof was not significant in amount.

All of the above indicates an effort to overcome a market disadvantage rather than to obtain a captive market for its product or to eliminate a competitor. The terms of the contract itself indicates an intention to retain Rome after the acquisition as an active participant in the market which it occupied.

Concentration

Another factor deemed important in providing a factual background for weighing the probable effect of the acquisition is the trend toward concentration in the industry involved. The Government contends that such a trend exists insofar as the aluminum conductor lines of commerce are involved. In support of the contention, emphasis is placed upon the fact that the combined shares of the market produced by the five integrated producers is roughly averaged at 80%. This fact loses its significance when it is realized that the production of aluminum and the fabricating of its products were concentrated to the point of a monopoly less than twenty years ago and has undergone a gradual decentralization

by the entry of new producers and fabricators since that time.

Alcoa has no history of acquisitions or mergers prior to the acquisition of Rome. Alcoa acquired equipment or assets of three other corporations but aluminum wire and cable products were not involved therein and same could in no way contribute to a concentration in that industry.

The Government cites the acquisition by Olin-Mathieson of the Southern Electric Corp. in 1957. The acquisition by Kaiser in the same year of the U.S. Rubber Co. plant at Bristol, R.I. and the acquisition of John A. Roeblings' Sons Co. by Reynolds in 1961 as indicating a merger trend. When examined, the facts hardly support such an indication. Olin-Mathieson manufactured no aluminum wire and cable products prior to its acquisition of Southern. U.S. Rubber's market share of said products was 0.8% and Roebling's share was never over 0.1% prior to their acquisition by Kaiser and Reynolds as above. More significantly as indicating lack of competitive impact in the product market referred to is the post-acquisition market shares of the above acquiring and acquired companies which show a decline therein as does the Alcoa-Rome market share.

The market situation as to the two principal aluminum conductor lines of commerce can be summarized by stating that as to ACSR and bare aluminum cable, the number of producers of those products increased from Alcoa, alone, in 1940 to twelve such producers in 1950 which number is practically unchanged to date. There were about four producers of insulated wire and cable in 1951 (although government allotments of aluminum for that purpose were issued to eight) and as of April 1, 1961, there were twenty-nine producers of such products.

Ease of entry

Closely related to the question of trends of or concentration in the aluminum conductor lines of commerce is the question of the existence of barriers to the entry of additional competitors in that particular branch of the industry. This is sometimes referred to as the "case of entry".

The facts already stated above demonstrate that no serious impediment or barrier exists which would bar the entry of producers of wire and cable products. This is accounted for principally for the reason that similar techniques and the same machinery with but slight alterations may be used in the production of such copper and aluminum products. The fact that in ten years the number of producers of insulated wire and cable have risen from four to twenty-nine and most of the new entrants came from the ranks of insulated copper conductor producers is indicative that entry into the aluminum conductor field is dictated by the status of the competition rather than being controlled by actual economic barriers. That some companies have ceased making this product is not determinative. "It is competition, not competitors, which the Act protects". The evidence discloses that the withdrawal of certain producers from the production of this item was occasioned by an inability to make a profit and there is no evidence which would indicate that any potential producer has been unable to enter the industry when he thought that a profit could be made therein.

There is no doubt that problems are presented in the matter of the entry of a producer in the ACSR and bare aluminum cable market. The product itself involves specialized techniques and equipment especially in the larger sizes used in the overhead transmission field. In spite of difficulties, there are now

twelve such producers, one of whom plans an extension of its facilities. The situation in the industry as to the ease of entry of competitors therein is of course not determinative but is simply another factor to be considered in the appraisal of the problem as a whole.

Market shares

The market shares which Alcoa and Rome may control by the acquisition is one of the most important factors to be considered. Since the shares in each line of commerce (whether allowed or not) are discussed in the briefs, they will be set out here and the ultimate conclusions to be drawn therefrom will be found in the detailed findings to be filed in connection with this opinion.

In 1958, the Alcoa and Rome market percentages in the three principal aluminum conductor lines as claimed by plaintiff appear below.

	Alcoa	Rome
ACSR and Aluminum Cable, Bare	32.5	0.3
Aluminum Wire and Cable, Insulated or Covered	11.6	4.6
Aluminum Conductor Wire and Cable	27.8	1.3

The decline in the combined market percentages of Alcoa and Rome in the above products appears below, which shows a generally continued decline therein both pre- and post-acquisition.

	1954	1958	1961	Decline (percentage points)		
				1954–58	1958–61	1954–61
ACSR and Aluminum Cable, Bare	48.6	32.8	26.1	15.8	6.7	22.5
Aluminum Wire and Cable, Insulated or Covered	16.9	16.3	13.	.6	3.3	3.9
Aluminum Conductor Wire and Cable	43.9	29.1	24.8	14.8	4.3	19.1

In 1958 the market percentage of Alcoa and Rome in the four conductor (aluminum and copper) lines of commerce are set out below.

	Alcoa	Rome
Conductor Wire and Cable	1.8	1.4
Conductor Wire and Cable, Bare	10.3	2.
Wire and Cable, Insulated or Covered	.3	1.3
Service Drop	10.8	8.1

The plaintiff contends that the above percentage table should be increased by the shipments of conductor wire and cable made by the Rea Magnet Wire Co. for 1958. This company was acquired by Alcoa in 1960. Same would seem unimportant from a competitive standpoint since its product was entirely copper wire of small size used principally in coils, transformers, etc. It made no product which competed with Rome. If such products were added, it would increase the total of Alcoa and Rome by 1.1% for conductor wire and cable and 1.3% for wire and cable, insulated, and actually add little or nothing to the significance of the percentages involved.

There is no evidence that the market shares in the conductor lines of commerce have increased or diminished since the acquisition. It would be speculative to assume that the percentages have changed appreciably except perhaps in the case of service drop which is composed principally of aluminum as the conductor and would seem to be included within the insulated or covered aluminum wire line and therefore subject to the post-acquisition decline therein.

In the conduit lines of commerce, no probative pre-acquisition market data is available. At that time, Alcoa made only aluminum conduit while Rome made only steel conduit. Based upon a survey first made about 1960, Alcoa's share in the conduit market

(aluminum and steel) was 3.4% and Rome's share was 3.5%. In aluminum conduit alone, the survey shows that in 1960 Alcoa's market share was 12.0% and Rome's as agent for Alcoa was 14.5%. These later figures should not be construed as showing that Rome in the post-acquisition period actually manufactured aluminum conduit. It had no extruding facilities. The above percentage apparently represents sales of aluminum conduit completely manufactured by Alcoa but sold by Rome as its agent and conduit pipe produced by Alcoa and threaded at the California plant of Rome. The accuracy of the above market shares is seriously questioned by defendants which, together with their incompleteness, afford little, if any, basis for a finding of the effect of the acquisition upon competition in either of the alleged lines of commerce whether or not allowed as such.

The market shares of the defendants in aluminum ingot and rod line of commerce appear to be inconclusive. Rome was not a producer of primary aluminum and did not compete in that market. Rome's purchase of primary aluminum amounted to .2% of the total industry production and .3% of Alcoa's production. Rome manufactured its own rod and additionally sold a small amount thereof for conductor use to non-integrated producers of wire and cable. Percentagewise, such sales amounted to a fraction of one percent of the market.

Industry evidence

In Brown Shoe, as in several other reported decisions, industry evidence as to the actual or potential effect of the acquisition upon suppliers and purchasers has been considered as a factor in determining the effect of the acquisition upon suppliers and purchasers. There is an entire absence of such evidence on the part of the Government. The passage of al-

most three years from the time of acquisition to the time of trial would seem to bring to light the anti-competitive effect of same if in fact it existed. Evidence to the contrary appears in the record. The defendants, through some eight or more witnesses, actively engaged in the aluminum wire and cable industry—all testified without exception that the acquisition has not had an adverse effect upon the purchasers of such products. No difficulty has been encountered in expanding their list of suppliers and that competition among such suppliers has not been affected.

The dominant position of Alcoa

Throughout the trial and in the submitted briefs, the Government has taken the position that Alcoa occupies a dominant position in the production of primary aluminum and in the manufacture of aluminum conductor wire and cable products. It is urged that this acquisition has enhanced that position and is therefore a factor in determining the competitive effects thereof. So much reliance is placed thereon that a brief discussion would seem appropriate.

Undoubtedly Alcoa is large in size, both physically and financially. Its activities are varied and extensive. Care however must be taken not to exaggerate its influence because of its size alone, especially in the absence of evidence of the abuse of the power which goes with size. *U.S.* v. *U.S. Steel Corp.*, 251 U.S. 417; *U.S.* v. *Swift & Co.*, 286 U.S. 106. The mere intrusion of "bigness" into a competitive market will not in itself violate the statute. *Reynolds Metals Co.* v. *F.T.C.*, 309 F. 2d 223 at 230. Here the Government's contention as to the dominance of Alcoa appears to rest upon size alone without evidence as to the exercise of the power that goes with it. In 1957, Judge Cashin in *U.S.* v. *Aluminum Company of*

America, 153 F. Supp. 132 at 167, found as a fact that Alcoa's relative share of the aluminum market had declined at that time. That such decline has continued to date appears without contradiction in this case. An increase in the money value of products sold means nothing in the light of the increase in the total market and the decline in the rate of return on Alcoa's invested capital. The increase in the number and market shares of primary aluminum producers and wire and cable producers all point to the conclusion that Alcoa's position in the above markets is something less than dominant. In any event, if Alcoa has the power to dominate, the record fails to show that such power has been used to its own advantage. The position of Alcoa in the above mentioned markets is relevant in this proceeding as a part of the overall picture upon which the decision must be based but this court sees nothing therein from which it could find that such position and the use thereof are indicative of forbidden anti-competitive practices.

The competitive impact

In appraising the impact of the acquisition, we turn first to the relationship between Alcoa and Rome as a source of supply and as direct competitors.

The customer-supplier relationship, referred to as the vertical aspect, requires little comment. Rome's purchase from Alcoa of primary aluminum was about 1/10 of one percent of Alcoa's production of that product. This small amount is without significance from a competitive standpoint but indicates rather clearly that the acquisition did not involve the purchase by Alcoa of a captive market.

The market area in which both the acquiring and acquired companies manufactured and sold competing products was limited to four or five items previously mentioned herein. The combination of the manufac-

turing and selling facilities of the two companies on these items involves the horizontal aspect of the acquisition in its actual and probable effects upon competition.

In ACSR and bare aluminum cable, Rome's pre-acquisition share of the market was 0.3%. In fact, Rome competed only in the smaller sizes of the product while Alcoa manufactured and sold a full line thereof. The products known as covered line wire or weatherproof and multiplex cable may be discussed together. These products have many end uses but are limited here to "service drop" which has been rejected as a line of commerce. In 1958, Alcoa's share in the service drop market, according to the figures of the Census of Manufactures was 10.8% and Rome's was 5.1%. These figures do not however include the product known as weatherproof wire, also used as service drop, which was reported under a different classification. Pre-acquisition figures are not available as to the market shares of the defendants in the product known as conduit. During the above time period, Rome manufactured steel conduit, both rigid and thin or electrical metallic tubing (E.M.T.). Alcoa manufactured rigid aluminum conduit and aluminum E.M.T. so that competition between them was in effect the competition between steel and aluminum. The nature and extent of the inter-defendant competition, resulting from the above, may be gathered from the discussion of the market shares of the defendants in the conduit lines of commerce as contained herein and needs no repetition here. The same may be said of the item of redraw rod. The extent of the competition therein may also be gathered from the brief discussion herein of market shares of defendants in that item.

Considered only from the manufacturing level, the comparatively small percentages of the market which Rome held in the overlap or competing products would not alone condemn the acquisition especially in view of the purpose and the other relevant factors previously discussed.

The principal contention urged as violative of the statute arises from the premise that the integrated producers are involved in a struggle for monopoly power with the non-integrated producers as their opponents. The argument proceeds to the conclusion that the acquisition adds to the numerical and market strength of the integrated companies especially in the aluminum lines of commerce and is therefore to be condemned.

Without doubt, an integrated company enjoys advantages over its non-integrated competitor. Such advantages would include the ability to sell intermediate products as well as end or fabricated products. Thus at least two opportunities to make a profit are available. They are able to offer a broader line of products to the trade and their sales organizations are likewise given more latitude and sale techniques extended. These advantages are not necessarily conducive to competitive strength in the lines of commerce involved. The financial outlay required, the obtaining and holding of the required skills, the constant research and experimentation, which are required of the seller of intermediate products, are burdens which the fabricator avoids but the integrated producer must carry.

The arraying of the integrated companies on one side and the non-integrated companies on the other overlooks entirely the active and vigorous competition among the integrated companies. In Alcoa's analysis of its lost business from 1957 to 1959, it

appears that the larger portion of same was lost to integrated producers. Its loss of business to Rome during the same period was insignificant. Previous government action was designed to facilitate the entry of manufacturing competitors of Alcoa's products. Now that such competitors have come into existence, the realities of competition dictate that same may not be ignored or distorted in appraising the competitive market as a whole.

Plaintiff presents statistics tending to show that the market shares of the integrated companies in the aluminum conductor lines of commerce have increased from 1955 to 1959 while the shares of the non-integrated companies have decreased during the same period. This is accounted for principally by the addition of Anaconda and Olin-Mathieson (Ormet) to the list of integrated producers. More significant however is the fact that since the acquisition and up to 1961, the non-integrated companies have held or increased their market shares in the lines under discussion while the shares of the Alcoa-Rome combination have declined. In the ACSR and bare aluminum cable and aluminum conductor wire and cable lines, the non-integrated producers have retained their shares of the market, while the share of Alcoa-Rome in ACSR has dropped from 32.8% to 26.1% In aluminum conductor, the non-integrated producers have retained their market shares while the share of Alcoa has decreased from 29.1% to 24.8%. In the insulated or covered line of commerce, the non-integrated producers market share has increased from 29.8% to 33.5% while the share of Alcoa-Rome has declined from 16.3% to 13.0%.

The above is proof of what has actually happened in the competitive market. It is a competitive reality much more convincing than arguments based upon speculative future market conditions. When such facts

are supported by the oral testimony of utility purchasing agents and non-integrated manufacturers to the effect that the acquisition has not adversely affected their businesses, a finding of a substantial lessening of competition is precluded. The fact that some four or five non-integrated producers have reduced or abandoned their aluminum conductor wire business since 1956 is offset by the entry of at least one new company and increase in their productive facilities by four others. The reduction in or abandonment of the manufacturing of these products were brought about principally by an inability to make a profit therein. This situation tends to confirm rather than to negate the existence of a vigorous competition in the products involved.

The plaintiff advances the argument that the acquisition has eliminated the "potential competition" which would have existed if Rome and Alcoa had separately expanded their facilities so as to include additional aluminum products or increased the production of the overlapping competing products. Like many business concerns, the defendants undoubtedly were constantly reviewing their product lines and exploring the possibilities of expansion. There is no evidence however that either had reached a firm conclusion that such an expansion had or would meet with the necessary approval of those in authority. Expansion from within rather than by acquisition may be preferable from the economist's point of view but the statute makes no such prohibition. The substantial lessening of competition, either actual or probable, is the test.

Considerable discussion is found in plaintiff's brief to the effect that this acquisition increased the problem of a "price squeeze" by the integrated producers or by Alcoa in particular. The discussion proceeds upon the theory that the price of primary aluminum to the fabri-

cators may be so increased that they will be unable to make a profit from sale of the end products. This court does not understand just how the acquisition could affect the problem. Rome was not a primary aluminum producer and its acquisition by Alcoa did not affect either the production or price of that product. Certainly the fabricator would like to buy his basic material as cheap as possible. This contention ignores the competition between primary aluminum producers and seems to assume without evidence to support it that such producers will abandon by an unconscionable pricing arrangement the market for primary aluminum and be content to sell only the end product. This overlooks entirely the present competitive situation among primary aluminum producers, the government required allotment of primary aluminum, and the availability of Canadian and foreign intermediate aluminum products. The argument is purely speculative and without evidence to support it.

Although the above discussion applies particularly to the three alleged aluminum conductor lines of commerce, the factors considered would also apply to aluminum ingot and rod used in the production of aluminum conductor wire and cable and to service drop cable which are urged as proper lines of commerce here by the plaintiff. No separate discussion of the competitive effect of the acquisition upon those two lines of commerce is necessary. While service drop is made with either an aluminum or copper conductor, the aluminum type presently predominates. The ease of entry into the business of manufacturing of service drop and the evidence that the Alcoa-Rome share of the market in insulated or covered aluminum conductor, which includes aluminum conductor service drop, has diminished since the acquisition, in particular prompts the conclusion that the acquisition does

not violate the statute insofar as the service drop and aluminum ingot may be involved.

The competitive effect of the acquisition in the three principal conductor (aluminum and copper) lines of commerce is not particularly stressed in the plaintiff's briefs or argument. The market shares of Alcoa and Rome therein are not impressive. Alcoa's higher percentage of the market in conductor wire and cable, bare, is made up of ACSR and bare aluminum cable which comprises all but one-tenth of one percent of its market share. Rome's share in the same item (lacking one-tenth of one percent, is made up of bare conductor copper wire and cable which are not competitive with ACSR as indicated in the discussion of ACSR as an appropriate line of commerce. There is no evidence of post-acquisition trends in the lines now considered. Likewise there is no evidence that the market, broadened by the inclusion of the competition afforded by the over two-hundred wire and cable producers (both aluminum and copper), will suffer actual or probable anti-competitive effects. There is evidence that such market comprises many strong and vigorous competitors. Alcoa obtained by the acquisition a diversification of its product line by the addition of Rome's copper wire and cable products. Rome however remains as the same source of supply of such products. Considering the same factors discussed herein and applying same to the items presently referred to leads to the conclusion that the statute is not violated as to the three conductor lines of commerce referred to above.

The approach to the consideration of the competitive effect of acquisition upon the conduit lines of commerce is handicapped by the absence of reliable market data. The Brown Shoe case opinion, in referring to the Congressional intent, uses the language

"demonstrable anticompetitive effects" as the type of mergers to be invalidated by the statute. Prior to the acquisition, Alcoa manufactured only aluminum conduit, Rome only steel. We have no evidence of the pre-acquisition share of either company in the market. We do have a hesitating and inconclusive estimate of Rome sales in the eleven western states which is rejected as a proper geographic market. The available post-acquisition data lacks the reliability upon which a demonstrable anticompetitive effect may rest. In 1960, the Bureau of the Census compiled figures that defendants' market share of conduit, both steel and aluminum, was 6.9%. This percentage was allocated 3.4% to Alcoa and 3.5% to Rome. The same report attributes the defendants' combined share of aluminum conduit at 26.5%. The above was the first such survey made by the Bureau and forms for same were sent only to those who designated themselves as producers of conduit in 1958 and 1959. The evidence shows that at least three aluminum producers entered the conduit field in the 1958–1960 time period.

Again plaintiff appears to stress the status of the defendants in the aluminum conduit line as having anticompetitive effects. Although aluminum conduit has been rejected as a relevant line of commerce here, brief comment will be made relative thereto. Entry to the aluminum conduit market requires only an outlay of ten to fifteen thousand dollars by those producers owning extruding equipment. In 1950, there were fifty such owners. The number increased to one hundred and ten in 1955 and to one hundred thirty-three in 1960. The ease of entry is further corroborated by the substantial number of new producers of aluminum conduit in recent years. This is due to the increased demand for the product and provides an active competitive market therein. There is a failure

of proof to show that the statute is violated by the acquisition as to either of the conduit lines of commerce as claimed by the plaintiff.

Using the pragmatic practical approach, an appraisal of the acquisition here involved designates same as the combination of an aluminum and an essentially copper manufacturing company. Such an acquisition implies advantages to the acquiring company. Such advantages are not to be condemned unless they portend or approach monopoly proportions. It is the loss to competition rather than the advantage gained that invokes the statute here. Alcoa gained an increase in its scientific knowledge and ability in insulating techniques and a diversification of its line of salable products. This would seem to be a legitimate end in the face of its declining market. There is less need than usual to speculate here upon the effect of the acquisition upon competition. Not only do we have industry evidence as to the actual effect from competitors and purchasers but we also have the factual results of almost three years of market experience. After consideration of all of the evidence offered herein, it is concluded that the acquisition by Alcoa of the capital stock of Rome has not been shown to be in violation of Section 7 of the Clayton Act; that the claim of the complaint has not been established and that same should be dismissed.

This opinion, together with the Findings of Fact and Conclusions of Law, to be filed herewith, will constitute the Findings and Conclusions of this court and judgment is directed accordingly.

So ordered.

STEPHAN W. BRENNAN,
United States District Judge.

APPENDIX B

United States District Court
Northern District of New York

Civil No. 8030

UNITED STATES OF AMERICA, PLAINTIFF

against

ALUMINUM COMPANY OF AMERICA AND
ROME CABLE CORPORATION, DEFENDANTS

The Findings of Fact and Conclusions of Law, set out below, together with the opinion, filed herewith, will constitute the decision in this case.

Findings of Fact

1. The defendants, Aluminum Company of America and Rome Cable Corporation, hereinafter referred to as Alcoa and Rome, maintain offices, transact business and are found within the Northern District of New York.

2. The defendant Alcoa is a corporation organized and existing under the laws of the State of Pennsylvania, with its principal office in Pittsburgh, Pennsylvania.

3. Alcoa is an integrated aluminum producer engaged in the manufacture and sale of primary aluminum, intermediate aluminum products, and various end products. It manufactures these products in several states and sells and ships such products throughout the United States in interstate commerce.

4. The defendant Rome is a wholly owned subsidiary of Alcoa, organized and existing under the laws of the State of Delaware, with its principal office at Rome, New York. It was organized by Alcoa for the purpose of holding the assets of its predecessor, also called Rome Cable Corporation, a New York corporation.

5. Rome manufactures, among other products, copper rod, electrical wire and cable, conduit and cable trough and cable installation devices. It manufactures these products in several states and sells and ships them in interstate commerce to its customers located in many states of the United States.

6. On March 31, 1959, defendant Alcoa acquired by stock transfer all of the assets of Rome-New York. Title to such assets was taken by the defendant Rome (Delaware) which also assumed Rome-New York's liabilities.

7. Alcoa's purpose in acquiring Rome was to acquire the ability to manufacture the more complicated insulated wire and cable products and diversify its operations. Rome's manufacture of aluminum products did not induce said acquisition.

8. In its search for a suitable company, Alcoa in 1958 retained the services of Ebasco Services, Inc. Ebasco was advised that Alcoa's purpose was to secure know-how in the insulating field.

9. While Alcoa considered other insulating companies, Rome was its first choice. This preference arose principally from the fact that Rome's personnel and organization were well and favorably known to Alcoa through their mutual association in a "tolling arrangement" entered into in 1952.

10. In the course of negotiations with Rome, Alcoa made it clear that, if acquired, Rome would operate as a separate division with a high degree of autonomy

and increased responsibility with regard to the sale of wire, cable and conduit products.

11. The evidence does not establish that Alcoa's acquisition of Rome was part of a continuing program contemplating future expansion through mergers or acquisitions in wire and cable, conduit, or any related field.

12. Alcoa mines and processes bauxite, refines bauxite into alumina, and smelts alumina into aluminum. The aluminum, so produced, is sold either in alloyed or unalloyed form, as ingot, or is used by Alcoa in its own fabrication of a wide variety of semi-finished and finished products. Among the products fabricated by Alcoa are sheet and plate, extrusions, castings, forgings, wire, rod and bar, electrical conductors and accessories, conduit, foil, tubing, rivets and screw machine products, closures, and powder and paste.

13. Prior to the acquisition of Rome, Alcoa's participation in the electrical wire and cable field was limited to the manufacture and sale of bare all-aluminum cable, bare aluminum conductor steel reinforced (ACSR), and polyethylene covered line wire and multiplex cable. It also sold neoprene covered line wire and multiplex cable manufactured for it by Rome. Alcoa made no electrical wire and cable products using copper as the conductor; nor did it make any of the more complicated insulated constructions, such as, among others, building wire, power cable, control cable, and magnet wire.

14. Bare wire and cable products constituted the great preponderance of Alcoa's sales in the electrical wire and cable field. In 1958, out of Alcoa's total conductor wire and cable shipments of 62.9 million pounds, ACSR and bare aluminum cable amounted to 56.9 million pounds, or more than 90 percent of the total.

15. While Alcoa continues to be the leading United States producer of primary aluminum and fabricated aluminum products, its position has declined markedly in recent years (Opinion, page 11).

16. Prior to the acquisition, Rome was primarily a manufacturer of electrical wire and cable. It had three manufacturing plants located at Rome, New York; Torrance, California; and Collegeville, Pennsylvania. It produced and sold bare wire and cable and a diversified line of insulated wire and cable products; it manufactured copper and aluminum rod for use in its own operations and for sale to other manufacturers; and it produced copper rod and certain wire and cable products on a toll basis using materials supplied by others. In addition, at its plant in Torrance, California, Rome manufactured steel rigid conduit and electrical metallic tubing (commonly referred to as EMT) and mechanical steel tubing. At its Cope Division plant in Collegeville, Pennsylvania, it manufactured a line of cable supporting systems, including cable trough and trays. In calendar year 1958, Rome's sales (exclusive of toll conversion) in its major product categories were approximately as follows: Wire and cable, $23.4 million; rod, 4 million (includes aluminum rod sales of $128 thousand); conduit (rigid and EMT) $6.5 million; and, Cope products, $1.3 million.

17. Rome's primary emphasis in the wire and cable field was on the manufacture of insulated wire and cable products. It was a skilled manufacturer of the more complicated insulated products, and had in this area technical ability that Alcoa lacked.

18. Copper was by far the predominant metal used by Rome in its wire and cable operations. Its importance is shown by the fact that in the five years prior to the acquisition copper represented more than

90 percent of Rome's combined copper and aluminum purchases, and copper products accounted for more than 90 percent of its wire and cable sales revenue.

19. On March 7, 1952, Alcoa and Rome entered into a continuing agreement, referred to as a "tolling agreement", whereby Rome would cover bare aluminum wire furnished by Alcoa for the account of Alcoa. The agreement provided that Rome would cover or insulate bare aluminum wire with neoprene or polyethelene insulating materials. The arrangement permitted Alcoa to take advantage of the superior "know-how" of Rome in the matter of covering of bare wire products some of which were sold in competition with Rome.

20. Prior to the acquisition only five products were manufactured and sold by both Alcoa and Rome. These products can be identified as follows: (a) Aluminum Conductor Steel Reinforced (ACSR) and Aluminum Cable, Bare; (b) Covered Line Wire (also referred to as Weather-proof). This product consists of a copper or aluminum conductor covered with a synthetic rubber (neoprene), thermo-plastic (Polyethylene), or fibrous covering; (c) Multiplex Cable; (d) Conduit; (e) Aluminum Redraw Rod. Aluminum redraw rod is an intermediate aluminum product used in the fabrication of aluminum wire.

21. Prior to the acquisition, defendants manufactured and sold the overlap products refered to in Finding 20 as follows:

(a) ACSR and Aluminum Cable, Bare. Alcoa made ACSR and aluminum cable, bare, in a full range of sizes; Rome made only a limited range of sizes. Alcoa's total sales amounted to approximately $23,000,000 in 1958 of which approximately $8,000,000 represented sales in the size range Rome was able to make.

Rome's sales in 1958 amounted to approximately $240,000.

(b) Covered Line Wire and Multiplex Cable. Alcoa did not sell these products until 1952 when it entered into a tolling arrangement with Rome under which Rome manufactured polyethylene and neoprene covered aluminum line wire and multiplex cable which Alcoa sold for its own account. In 1956, Alcoa started to produce its own polyethylene covered line wire and multiplex cable, and at the time of the acquisition it had under consideration a plan to install neoprene covering facilities. Rome produced covered line wire using copper or aluminum conductors and having either neoprene, polyethylene or fibrous covering. It also produced multiplex cable using copper and aluminum insulated conductors. Alcoa's covered line wire and multiplex sales in 1958 amounted to approximately $4,200,000; Rome's sales in that year, including both copper and aluminum, were approximately $3,700,000.

(c) Conduit. Prior to the acquisition, Rome manufactured steel conduit, both rigid and EMT; it made no aluminum conduit. Alcoa manufactured rigid aluminum conduit and aluminum EMT; it made no steel conduit. Alcoa's sales of aluminum conduit in 1958 amounted to approximately $525,000; Rome's sales of steel conduit amounted to about $6,500,000.

(d) Aluminum Redraw Rod. Prior to the acquisition Alcoa produced aluminum redraw rod on its rolling mills and Rome produced such rod by the Properzi method. Alcoa made sales of aluminum rod to other manufacturers of approximately $2,500,000 in 1958. Most of Rome's aluminum rod was consumed in its own operations, its sales to other manufacturers in 1958 amounting to only about $128,000.

22. Alcoa's net sales and operating revenues in 1958 amounted to approximately $753,000,000. Its sales in the overlap area, consisting of ACSR and aluminum cable, bare (sizes 336,400 cir. mils. and smaller), covered line wire and multiplex cable, conduit and aluminum rod, totalled approximately $15,300,000, or about 2 percent of its net sales and operating revenues. The ratio between Alcoa's overlap and total sales for earlier years is approximately the same.

LINES OF COMMERCE

Explanation

Items 1–10, set forth on pages 13 and 14 of the filed opinion, detail the lines of commerce urged by the plaintiff as properly established in this action. Reference to same is made here without the repetition thereof. The Findings below are intended to supplement those made in the discussion of the various items as same appears in pages 14 to 19 of said opinion.

Aluminum conductor lines

23. Item 1, aluminum conductor wire and cable, is a composite of Items 2 and 3 and is not a separate and distinct line of commerce here. (See Opinion, page 15.)

24. Item 2, bare aluminum cable and ACSR (aluminum covered steel reinforced) have virtually displaced bare copper cable for use in overhead transmission lines. They are generally recognized as a separate product classification and the manufacture and sale of these products require special stranding equipment and designing skill. The parties have agreed that the manufacture and sale of bare aluminum cable and ACSR may be treated as a separate line of commerce for the purpose of this case and it is so found.

25. Item 3, insulated or covered aluminum wire and cable. The wire and cable industry defines insulated wire and cable products according to function or type, not according to the metal used as conductor.

26. Manufacturers of insulated wire and cable products regard themselves as insulators of wire and cable products, not as insulators of copper wire and cable on the one hand, or of aluminum wire and cable on the other.

27. The evidence establishes that wire and cable fabricators can draw, strand and insulate copper and aluminum interchangeably on the same equipment and with the same personnel. The only change required is the use of a different lubricant in the drawing operation and a cleanup of the drawing machine when it is to be used on a different metal.

28. Since copper and aluminum products are completely interchangeable from a performance standpoint, utility companies choose between copper and aluminum insulated or covered overhead products solely on the basis of economics. The decision requires evaluation of numerous economic factors in addition to the cost of the wire or cable itself.

29. While aluminum is used in various insulated wire and cable products, most such products, accounting for more than $1,250,000,000 out of total 1958 insulated wire and cable shipments of $1,320,000,000, are predominantly made from copper. Aluminum has gained its greatest acceptance in the insulated or covered field in products used in the overhead distribution of electric power, principally, covered line wire (weatherproof) and multiplex cable. Even with respect to these products, however, substantial quantities are sold using copper as the conductor.

30. Item 4. Aluminum ingot and rod used in the production of aluminum conductor wire and cable is a separate line of commerce. (See Opinion, page 16.)

Conductor wire and cable lines

31. Item 5, Conductor wire and cable (aluminum and copper) as a line of commerce corresponds to the electrical wire and cable industry. It includes the manufacture and sale of all bare and insulated or covered electrical wire and cable products, whether made from copper or aluminum. There is a generally recognized electrical wire and cable industry and the parties agree that conductor wire and cable may be treated as a line of commerce for the purpose of this case.

32. Item 6, Conductor wire and cable, bare (aluminum and copper), which consists of ACSR and aluminum cable, bare; bare conductor aluminum wire; and bare conductor copper wire and cable, is not a separate line of commerce here (Opinion, page 17).

33. Item 7, Wire and cable, insulated or covered (aluminum and copper) line of commerce consists of the manufacture and sale of all insulated or covered wire and cable products, both copper and aluminum and it is agreed that same constitutes a separate line of commerce here.

34. By Item 8, Service drop cable (aluminum and copper), plaintiff refers exclusively to multiplex cable, both copper and aluminum. The evidence fails to establish that the manufacture and sale of multiplex cable is a line of commerce separate and distinct from the manufacture and sale of other insulated or covered wire and cable products.

35. Multiplex cable is only one of many products of the insulated wire and cable industry. It is one of the simplest of such products, being nothing more than one or more simple insulated conductors twisted together with a bare cable. It requires no unique production facilities.

36. Virtually any manufacturer of insulated wire and cable products is capable of making multiplex

cable. A company equipped to manufacture building wire, power cable, control cable, or practically any other insulated wire and cable product can use its existing machinery and personnel to manufacture multiplex cable. Such companies constantly review their product lines, and switch from one product to another whenever it is profitable to do so.

37. Multiplex cable is not used exclusively as a service drop from the utility pole to the building, nor is it the only product used for that function.

(a) Weatherproof line wire in the form of two or three separate wires is extensively used for service drop purposes.

(b) Other cable, including Type K and Type SD cable, are used for service drop purposes.

(c) In addition to being used for service drop purposes, multiplex cable is also used as a self-supporting secondary line. The IPCEA-NEMA Standards Publications covering multiplex cable define the product as "neutral-supported secondary and service drop cables."

38. Item 9, Conduit (aluminum and steel). The parties are agreed that the manufacture and sale of conduit, both aluminum and steel, may be treated as a line of commerce for the purpose of this case.

39. The evidence does not establish that the manufacture and sale of aluminum conduit is a separate line of commerce.

40. Steel conduit and aluminum conduit are functionally interchangeable. Both are used to enclose and protect electrical wires and cables against external mechanical and chemical abuse. The evidence establishes that steel and aluminum conduit are in direct and substantial competition with each other.

41. The pricing of steel and aluminum conduit is directly related. Changes in the price of steel con-

duit cause corresponding changes in the price of aluminum conduit, and vice versa.

42. Aluminum conduit manufacturers meet strong and vigorous competition from the manufacturers of steel conduit, and vice versa.

THE GEOGRAPHIC MARKET

43. The parties agree that the United States as a whole is a proper geographic market or "section of the country" within which the impact of the acquisition may be measured as to all of the lines of commerce, whether or not allowed herein.

44. It has not been established that the eleven western states (Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming) constitute an appropriate geographic market or "section of the country" with respect to either the conduit or the alleged aluminum conduit lines of commerce.

COMPETITIVE EFFECT IN THE CLAIMED LINES OF COMMERCE

45(a). Statistics showing Alcoa and Rome market shares in the aluminum conductor lines of commerce, both before and since the acquisition, are set forth in the following tables.

ACSR and Aluminum Cable, Bare

Year	Alcoa	Rome
	Percent	*Percent*
1954	48.4	0.2
1955	43.2	.1
1956	29.8	.3
1957	32.3	.3
1958	32.5	.3
1959	31.4	.7
1960	30.6	.1
1961	26.1	----------

Aluminum Wire and Cable, Insulated or Covered

Year	Alcoa	Rome
	Percent	*Percent*
1954	10.0	6.9
1955	10.8	6.9
1956	8.5	6.2
1957	9.4	5.3
1958	11.6	4.7
1959	12.2	4.4
1960	10.6	4.2
1961	7.3	5.7

Aluminum Conductor Wire and Cable

Year	Alcoa	Rome
	Percent	*Percent*
1954	42.8	1.1
1955	36.6	1.5
1956	24.8	1.7
1957	27.4	1.4
1958	27.8	1.3
1959	28.9	1.5
1960	25.4	1.2
1961	23.8	1.3

45(b). The relative market position of Alcoa and Rome combined in each of the three alleged aluminum conductor lines of commerce declined substantially both before and since the acquisition.

Alcoa-Rome Market Percentages

	1954	1958	1961	Decline percentage points		
				1954–58	1958–61	1954–61
ACSR and Aluminum Cable, Bare	48.6	32.8	26.1	15.8	6.7	22.5
Aluminum Wire and Cable, Insulated or Covered	16.9	16.3	13.	.6	3.3	3.9
Aluminum Conductor Wire and Cable	43.9	29.1	24.8	14.8	4.3	19.1

46. There is no significant pattern or trend of mergers with respect to the manufacture and sale of aluminum conductor wire and cable products.

47. In addition to Alcoa's acquisition of Rome, the only acquisitions which relate in any way to aluminum conductor wire and cable products were Olin-

Mathieson Chemical Corporation's acquisition of Southern Electrical Corporation in early 1957, Kaiser Aluminum and Chemical Corporation's acquisition of the Bristol plant of United States Rubber Corporation in early 1957, the Reynolds Metals Company's acquisition of the machinery of John A. Roebling's Sons Division of the Colorado Fuel and Iron Corporation in 1961.

48. Market statistics reflecting the market shares of the acquiring and acquired companies, both before and since the acquisitions are set forth in the following table:

Percentage Participation in Aluminum Conductor Wire and Cable

	1956	1956	1957	1958	1959
Southern Electrical	5.4	3.1			
Olin-Mathieson	.0	.0			
Combined Post-Acquisition			5.6	4.5	5.0
Kaiser	21.9	19.5			
U.S. Rubber	.8	.8			
Combined Post-Acquisition			18.8	23.1	19.0
Reynolds	8.0	8.1	9.0	10.4	10.8
Roebling	.0	.0	.0	.0	.1

49. The evidence fails to establish that Olin's acquisition of Southern and Kaiser's acquisition of the Bristol Plant of U.S. Rubber has hurt or will adversely affect competing manufacturers of aluminum wire and cable products.

50. No competing manufacturer of aluminum conductor wire and cable products has complained that this acquisition has or may adversely affect his competitive position. On the contrary, representatives of Central Cable, Southwire, General Cable, Essex, Nehring and other wire and cable manufacturers stated that in the three years since the acquisition there had been no adverse effect. No manufacturer-witness testified that he foresaw any future adverse effect, as a result of this acquisition.

51. The evidence fails to establish that Alcoa's ability to offer a broad line of insulated products, including those made from copper, gives it any substantial competitive advantage in the sale of aluminum wire and cable products.

52. The evidence establishes that prior to the acquisition, there was not substantial or vigorous competition between Alcoa and Rome in the sale of aluminum conductor wire and cable products. Alcoa's loss of business in such products from 1957 to 1959 was insignificant.

53. In regard particularly to the overlap wire and cable products, Rome was not an aggressive price competitor. It adhered to a policy of not going below the prices of its competitors. It rarely participated in competitive bidding for ACSR; on insulated or covered products, it would generally quote on the basis of its published price schedules. Rome's adherence to this policy is established by the testimony of utility purchasing agents who stated, without contradiction that Rome was not an initiator of price reductions.

54. As recently as 1951, there were only four manufacturers of insulated wire and cable using aluminum conductor. The evidence establishes that as of April 1, 1961, there were at least 29 producers of insulated aluminum wire and cable.

55. Companies equipped to manufacture more complicated insulated copper wire and cable products, such as building wire, power cable and control cable, can readily manufacture the more simple products such as line wire and multiplex cable, using either copper or aluminum conductors, with its existing machinery and personnel.

56. The numerous manufacturers of insulated wire and cable constantly review their product lines and

switch readily from one product or conductor metal to another in accordance with market conditions. Such manufacturers not presently making insulated or covered aluminum products have considered whether or not to make such products, and would make them if profitable orders were obtained.

57. There has been substantial entry into the manufacture of ACSR and bare aluminum cable. Prior to 1940, Alcoa was virtually the only producer of these products; by 1950 there were 12 producers, most of whom were experienced copper wire and cable producers before getting into the ACSR field.

58. The evidence fails to establish or to permit the inference that any person has ceased or has been or probably will be deterred from entering into the manufacture and sale of aluminum conductor wire and cable products because of this acquisition.

59. Purchasers of the overlapping aluminum conductor products—ACSR and aluminum cable, bare, aluminum line wire, and aluminum multiplex cable—have not been and will not be adversely affected by the Rome acquisition.

60. Some of the utilities which formerly purchased from both Alcoa and Rome have sought to broaden the competitive base of their wire and cable purchasing. No difficulty has been encountered in expanding the supplier group.

61. Prior to the acquisition, Rome was a follower rather than an initiater of price reductions or concessions. It was rarely awarded business on the basis of competitive bidding.

62. The evidence establishes that there is vigorous competition among all manufacturers of aluminum conductor wire and cable products. The evidence fails to establish that any competitor of Alcoa and Rome, either integrated or non-integrated, has been or will be adversely affected by this acquisition.

63. Non-integrated manufacturers of aluminum conductor wire and cable products will not be deprived of a source of aluminum as a result of Alcoa's acquisition of Rome.

64. Substantial quantities of aluminum are available from foreign sources. Canadian production alone in 1960 amounted to more than 1.5 billion pounds, or more than 35 percent of total U.S. primary aluminum production. Such foreign aluminum is suitable for use by wire and cable fabricators and such fabricators have, in fact, purchased substantial amounts of foreign aluminum.

65. Alcoa's ability to supply non-integrated fabricators, including manufacturers of aluminum wire and cable will not be affected by the acquisition of Rome. It has operated below capacity since 1957.

The following table shows Rome's pre-acquisition purchases of aluminum.

[Thousands of pounds]

Year	Total U.S. primary aluminum production	Alcoa primary aluminum production	Rome primary aluminum purchases	Rome primary aluminum purchases	
				Percent of total U.S. primary aluminum production	Percent of Alcoa primary aluminum production
1954	2,921,130	1,331,874	1,611	0.1	0.1
1955	3,131,442	1,404,461	3,175	.1	.2
1956	3,357,608	1,512,275	5,288	.2	.3
1957	3,295,418	1,424,095	3,256	.1	.2
1958	3,131,114	1,061,734	3,129	.1	.3

Under provisions of supply contracts with the General Services Administration, Alcoa is obligated to make available to non-integrated fabricators approximately 150,000,000 pounds of aluminum each year through 1971. Similar obligations on the part of Kaiser, Reynolds, and Harvey, make available to

non-integrated users approximately 300,000,000 additional pounds of aluminum.

66. The acquisition of Rome by Alcoa will not bring about, enhance or aggravate any so-called "price squeeze" on non-integrated fabricators of aluminum wire and cable.

67. The evidence fails to establish that either Alcoa or Rome would have become a more significant factor in the manufacture and sale of aluminum wire and cable products if the acquisition had not occurred. Neither company had definite plans to expand its aluminum wire and cable production.

68. The following table sets forth Rome's copper and aluminum wire and cable sales during the five full years preceding the acquisition.

[Thousands of dollars]

Year	Copper wire and cable	Aluminum wire and cable	Total	Percent copper
1964	$27,142	$1,770	$28,912	93.9
1965	36,921	2,458	39,379	93.8
1966	39,119	3,646	42,765	91.5
1967	26,992	2,858	29,850	90.3
1968	21,291	2,191	23,482	90.7
1969 (1st Qr.)	5,891	509	6,400	92.0

69. The evidence establishes that there is vigorous competition in the manufacture and sale of aluminum wire and cable products, that both integrated and non-integrated companies participate therein, and that there has been no reduction in the vigor of such competition since the acquisition.

70. Since Rome was not a primary aluminum producer, Alcoa and Rome did not compete in the sale of aluminum ingot whether used in the production of aluminum conductor wire and cable or otherwise.

71. Rome sold only limited amounts of aluminum redraw rod, of which only a de minimis amount was sold for electrical conductor use.

(a) Rome's sales of aluminum rod and the amounts sold for non-conductor and for conductor use are set forth in the following table:

[Thousands of pounds]

Year	Total EC rod sales	Sold for non-conductor	Sold for conductor use
1955	5		5
1956	139	124	15
1957	418	341	77
1958	387	372	15

(b) In its biggest year, 1957, Rome's rod sales for conductor use amounted to only about 3/10 of one percent of aluminum bar and rod sold by domestic primary aluminum producers to non-integrated producers of conductor wire and cable in that year. In addition, at least one other non-integrated fabricator sold aluminum rod, so that Rome's sales would be an even smaller percentage of the total.

72. The evidence fails to establish that Rome probably would have become a more significant supplier of aluminum redraw rod to manfacturers of conductor wire and cable.

73. At the time of the acquisition and for several years prior thereto, Rome was producing its own aluminum redraw rod and purchased only de minimis amounts from others.

74. The evidence fails to establish that any competing supplier of aluminum ingot or rod has been or may be adversely affected by this acquisition.

75. The evidence fails to establish any reasonable probability that Alcoa's acquisition of Rome has or will substantially lessen competition or tend to create a monopoly in any of the alleged aluminum conductor lines of commerce.

76. The pre-acquisition market percentages of Alcoa and Rome are set forth in the following table, which gives figures for 1958:

[Thousands of dollars]

	Shipments	Percent of industry
Conductor wire and cable:		
Industry	1, 553, 955	
Alcoa	28, 521	1. 8
Rome	22, 001	1. 4
Alcoa-Rome	50, 522	3. 2
Conductor wire and cable, bare:		
Industry	232, 280	
Alcoa	24, 020	10. 3
Rome	4, 579	.2
Alcoa-Rome	28, 599	12. 3
Wire and cable, insulated or covered:		
Industry	1, 321, 675	
Alcoa	4, 501	.3
Rome	17, 422	1. 3
Alcoa-Rome	21, 923	1. 6
Service drop:		
Alcoa		10. 8
Rome		5. 1
Alcoa-Rome		15 9

77. Alcoa and Rome were not substantially competitive in the manufacture and sale of bare conductor wire and cable products.

Industry and Alcoa and Rome shipments of bare conductor (aluminum and copper) products for 1958 are shown in the following table:

[Thousands of dollars]

	Industry shipments	Alcoa		Rome	
		Shipments	Percent	Shipments	Percent
ACSR and aluminum cable, bare	202, 392	23, 883	10.2	258	0.1
Bare conductor aluminum wire	13, 395	137	.1		
Bare conductor copper wire and cable	156, 493			4, 553	1.9
	222, 280	24, 020	10.3	4, 811	2.0

78. Alcoa and Rome were not substantially competitive in the manufacture and sale of insulated or covered wire and cable products. Both before and since the acquisition, Rome has manufactured a relatively full line of insulated wire and cable products, chiefly made from copper. Alcoa's preacquisition participation in the insulated wire and cable field was limited to aluminum covered line wire and multiplex cable, amounting in 1958 to 3/10 of 1 percent of total insulated or covered wire and cable shipments.

79. Alcoa's acquisition of the assets of Rea Magnet Wire Company on January 18, 1960 is without significance to any issue in this case.

80. Since Alcoa sold only aluminum bare and insulated or covered wire and cable products, the facts found with respect to the alleged aluminum conductor lines of commerce are also pertinent to the broader conductor lines of commerce.

81. The electrical wire and cable industry, including both copper and aluminum products, is characterized by vigorous competition. Upwards of 200 companies manufacture and sell electrical wire and cable, among them being many strong, well-financed and highly reputable concerns.

82. The evidence fails to establish any trend toward concentration in the manufacture and sale of wire and cable products.

83. On the basis of 1958 Census of Manufactures data, Alcoa in 1958 had 10.8 percent and Rome 5.1 percent of total industry shipments of service drop cable. The Census figures cannot be taken as a reliable measure of industry shipments of service drop products since they do not include weatherproof wire used as service drop which is reported to Census under a different classification. There is no evidence as to the amount of weatherproof wire used as service drop.

84. There is no company that makes only multiplex cable. On the contrary, it is only one of numerous insulated wire and cable products made by insulating companies. It is among the simplest of such products, and any company equipped to manufacture any other insulated wire and cable product, can use its existing machinery and personnel to make multiplex cable.

85. The evidence establishes that manufacturers not presently making multiplex cable constantly review their product lines, have considered entering into the manufacture of multiplex cable, and would be capable of doing so if market conditions warranted.

86. Aluminum has gained greater acceptance in multiplex cable than in any other insulated product. Prior to the acquisition, Alcoa sold only aluminum multiplex cable and Rome's multiplex cable was approximately 80 percent aluminum. The same is true as to other insulators for which data are available. Accordingly, the facts established with respect to the lack of effect of this acquisition on competition in the aluminum conductor lines of commerce are pertinent here.

87. The evidence fails to establish any reasonable probability that Alcoa's acquisition of Rome has or will substantially lessen competition or tend to create a monopoly in any of the alleged conductor wire and cable lines of commerce.

Conduit

88. There is no reliable evidence as to the pre-acquisition market shares of either Alcoa or Rome with respect to conduit, both steel and aluminum, or aluminum alone.

Based upon a 1960 Bureau of the Census report, defendants' combined share of the total conduit market in 1960 was 6.9 percent. Based upon the same

report, their combined 1960 share of conduit, other than steel, including aluminum conduit, was 26.5 percent.

The evidence shows the above report is based upon a survey undertaken for the first time in 1960 and lacks conclusiveness.

89. The evidence fails to establish that the acquisition has eliminated substantial actual or potential competition between Alcoa and Rome in the manufacture and sale of conduit or aluminum conduit.

90. Prior to the acquisition, Alcoa made and sold only aluminum conduit and Rome made and sold only steel conduit.

91. Alcoa's sales of aluminum conduit in the area where Rome sold most of its steel conduit were de minimis, ranging between $10,000 and $54,000 per year in the five years preceding the acquisition.

92. There are no substantial barriers to entry. Any company having extruding equipment can enter the aluminum conduit field by adding equipment needed for threading, labeling and lubricating which can be purchased for from $10 to $15 thousand.

93. The number of companies owning extrusion equipment has increased from 39 in 1950 to 110 in 1955, and to 133 in 1960.

94. It has not been shown that any company has been or will be deterred from entering the conduit field as a result of the Rome acquisition.

95. It has not been shown that purchasers of conduit or aluminum conduit have been or may be adversely affected in any way by Alcoa's acquisition of Rome.

96. It has not been established that any non-integrated manufacturer of aluminum conduit has been or may be adversely affected by this acquisition.

97. The decline in aluminum conduit prices since about 1958 is directly related to the competitive contest between steel and aluminum conduit.

98. The pricing of aluminum conduit to be competitive with steel was initiated by Hazelwood, a non-integrated producer, in about 1958 and continues as the result of such competition.

99. There is vigorous competition in the manufacture and sale of conduit and aluminum conduit. This competition has increased appreciably in recent years owing to the wider use and acceptance of aluminum conduit.

100. The evidence fails to establish any reasonable probability that Alcoa's acquisition of Rome has or will substantially lessen competition or tend to create a monopoly in the manufacture and sale of either aluminum conduit or conduit, including both steel and aluminum, in either the United States or the eleven western states.

CONCLUSIONS OF LAW

1. This Court has jurisdiction of the parties to and the subject matter of this action.

2. The manufacture and sale of each of the following products or product groups constitutes an appropriate line of commerce within the meaning of Section 7 of the Clayton Act:

Item 2. ACSR and aluminum cable, bare.
Item 4. Aluminum ingot and rod used in the production of aluminum conductor wire and cable.
Item 5. Conductor wire and cable (aluminum and copper).
Item 7. Wire and cable, insulated and covered (aluminum and copper).
Item 9. Conduit (aluminum and steel).

3. Plaintiff has failed to prove by a preponderance of the evidence that the manufacture and sale of any of the following products or product groups con-

stitutes an appropriate line of commerce within the meaning of Section 7 of the Clayton Act:

Item 1. Aluminum conductor wire and cable.
Item 3. Insulated or covered aluminum wire and cable.
Item 6. Conductor wire and cable, bare (aluminum and copper).
Item 8. Service drop cable (aluminum and copper).
Item 10. Aluminum conduit.

4. The United States as a whole constitutes a section of the country within the meaning of Section 7 of the Clayton Act with respect to each of the ten lines of commerce alleged in this case.

5. Plaintiff has failed to prove by a preponderance of the evidence that the eleven western state area, consisting of Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming, is an appropriate section of the country within the meaning of Section 7 of the Clayton Act with respect to either the conduit or the aluminum conduit line of commerce.

6. Plaintiff has failed to prove by a preponderance of the evidence that the effect of Alcoa's acquisition of the assets and properties of Rome may be substantially to lessen competition or to tend to create a monopoly in any line of commerce in any section of the country.

7. Plaintiff has failed to prove by a preponderance of the evidence that the effect of Alcoa's acquisition of the assets and properties of Rome may be substantially to lessen competition or to tend to create a monopoly in any of the following lines of commerce, either in the United States as a whole or in the eleven western states (assuming that area to be an appropriate section of the country):

Item 2. ACSR and aluminum cable, bare.
Item 4. Aluminum ingot and rod used in the production of aluminum conductor wire and cable.
Item 5. Conductor wire and cable (aluminum and copper).
Item 7. Wire and cable, insulated and covered (aluminum and copper).
Item 9. Conduit (aluminum and steel).

8. Assuming each of the following to have been established as an appropriate line of commerce, plaintiff has failed to prove by a preponderance of the evidence that the effect of Alcoa's acquisition of the assets and properties of Rome may be to substantially lessen competition or to tend to create a monopoly therein, either in the United States as a whole or in the eleven western states (assuming that area to be an appropriate section of the country):

Item 1. Aluminum conductor wire and cable.
Item 3. Aluminum wire and cable, insulated or covered.
Item 6. Conductor wire and cable, bare (aluminum and copper).
Item 8. Service drop cable (aluminum and copper).
Item 10. Aluminum conduit.

9. Plaintiff has failed to prove by a preponderance of the evidence that the acquisition of the assets and properties of Rome by the defendant Alcoa violates Section 7 of the Clayton Act.

10. Plaintiff has failed to establish the claims or cause of action alleged in the complaint and the relief requested therein shall be and hereby is denied and this suit dismissed, and

Judgment is directed accordingly.

STEPHEN W. BRENNAN,
U.S. District Judge.

Dated: January 28, 1963.

APPENDIX C

United States District Court
Northern District of New York

Civil No. 8030

UNITED STATES OF AMERICA, PLAINTIFF

v.

ALUMINUM COMPANY OF AMERICA AND ROME CABLE CORPORATION, DEFENDANTS

Additional Findings of Fact

Pursuant to a motion made by the defendants under the provisions of 52(b) Federal Rules of Civil Procedure, the court makes the additional Findings of Fact which are set out below, same to be considered as supplemental to the Findings and Conclusions previously filed.

1. Because of the closer manufacturing controls required, E.C. grade aluminum, like other alloys, is sold at a premium; however, the price of E.C. aluminum ingot changes directly and correspondingly with the basic price of aluminum ingot.

2. In 1956, the year of Rome's greatest primary aluminum purchases, such purchases amounted to less than 7/10 of 1 percent of total primary aluminum sold to non-integrated fabricators.

3. In view of the ability of aluminum producers to make E.C. and other types and alloys of aluminum interchangeably in accordance with orders received,

there is no basis for an inference that other producers will be foreclosed from a substantial market for primary aluminum as a result of Alcoa's acquisition of Rome.

4. Item 1, aluminum conductor wire and cable, excludes insulated copper products and therefore does not include all wire and cable products for which there is reasonable interchangeability of use or cross-elasticity of demand. In addition, the evidence fails to establish that the combination of bare and insulated aluminum wire and cable, considered as a whole, is generally recognized in the industry as a separate economic entity or submarket; nor, in view of facts found with respect to Item 3, insulated or covered aluminum wire and cable (Findings 25 to 29, inclusive; Opinion pp. 14–15) does the evidence establish that aluminum conductor wire and cable, including both bare and insulated products, has competitively significant peculiar characteristics and uses, is made on unique production facilities, or is sold by specialized vendors to a distinct class of customers.

STEPHEN W. BRENNAN,
United States District Judge.

v.

ALUMINUM COMPANY OF AMERICA AND
ROME CABLE CORPORATION

On Appeal from the United States District Court for the Northern District of New York

---

MOTION TO AFFIRM

Pursuant to Rule 16, Paragraph 1(c), of the Revised Rules of this Court, appellees Aluminum Company of America and Rome Cable Corporation move that the judgment of the district court be affirmed on the ground that the questions on which decision of the cause depends are so unsubstantial as not to need further argument.

STATEMENT

This is a direct appeal from the judgment of the district court holding that the acquisition of Rome Cable Corporation ("Rome") by Aluminum Company of America ("Alcoa") did not violate Section 7 of the Clayton Act, 15 U.S.C. 18. The Government does not challenge the court's findings of fact as "clearly erroneous" (Rule 52(a), Federal Rules of Civil Procedure) but urges that its ultimate findings on the line of commerce and competitive effect issues rested upon an erroneous interpretation of the statute (J.S., 14). It is appellees' position that the court, guided by this Court's decision in *Brown Shoe* v. *United States*, 370 U.S. 294 (1962), correctly applied the statute to the facts before it, that the court's reasoning is fully supported by both the *Brown Shoe* and *Philadelphia Bank*[1] cases, that no novel question of law is presented, and that the judgment should, therefore, be affirmed without further briefing and argument.

1. THE BACKGROUND OF THE ACQUISITION

The court described this acquisition as "the combination of an aluminum and an essentially copper manufacturing company" (App. A, 37a),[2] and found that it was undertaken by Alcoa "in the face of its declining market" (*ibid.*) for the purpose of obtaining insulating know-how and diversification needed "to overcome a market disadvantage . . ." (App. A, 22a). These facts, not challenged by appellant, provide the background for the acquisition.

---

[1] *United States* v. *The Philadelphia National Bank, et al.* .... U.S. .... (1963); 31 L.W. 4650.

[2] All references to the district court's opinion and findings are to Appendices A, B and C to the Jurisdictional Statement.

(a) The Contrast Between Alcoa and Rome

Alcoa is an integrated producer of aluminum and aluminum products (App. B, Fdgs. 3 and 12). Prior to acquiring Rome, its participation in the electrical wire and cable field was limited to bare aluminum conductor-steel reinforced ("ACSR"), bare aluminum cable, and two simple insulated or covered products, weatherproof line wire and multiplex cable. Bare aluminum wire and cable, including ACSR, was by far Alcoa's main conductor product, accounting in 1958 for more than 90 per cent of its total wire and cable sales (App. B, Fdg. 14). It made no product using copper conductor, did not make or sell any of the more complicated types of insulated wire and cable (App. B, Fdg. 13), and accounted for only .3 per cent of total 1958 insulated wire and cable shipments (copper and aluminum) (App. A, 26a; App. B, Fdg. 76).

Rome was and is primarily a manufacturer of electrical wire and cable (App. B, Fdg. 16).[3] Its primary emphasis was on the manufacture of insulated products, and it had the capability, which Alcoa lacked, to manufacture a broad range of complex electrical cables (App. B, Fdg. 17). Copper was by far the predominant metal used by Rome, accounting in the five years preceding the acquisition for more than 90 per cent of its combined copper and aluminum purchases and for from 90.3 per cent to almost 94 per cent of its total wire and cable sales revenue (App. B, Fdgs. 18 and 68). Rome's share of total 1958 insulated wire and cable shipments (copper and aluminum) amounted to 1.3 per cent (App. B, Fdg. 76).

[3] It produced these products only at its Rome, New York, plant; the Collegeville, Pennsylvania, and Torrance, California, plants referred to in the Jurisdictional Statement (p. 4) have never produced wire and cable products (App. B, Fdg. 16).

With respect to ACSR and bare aluminum cable—by far Alcoa's principal wire and cable product—Rome's total 1958 sales were approximately $240,000, representing about .3 per cent of industry sales and about 1 per cent of Rome's total wire and cable sales (App. B, Fdgs. 16, 21, 45(a)). With respect to aluminum weatherproof line wire and multiplex cable—the only overlapping wire and cable products which both companies sold to more than a *de minimis* extent—Rome's sales in 1958 amounted to $1.7 million,[4] or about 7 per cent of its total wire and cable sales revenue (AR 56; App. B, Fdg. 16). Alcoa's sales of these overlapping insulated aluminum products amounted to $4.2 million in 1958, or about one-half of one per cent of its net sales and operating revenues for that year (App. B, Fdgs. 21 and 22).

(b) Alcoa's Declining Market Position

The Alcoa of the 1960's is not the Alcoa of 30 years ago, and the district court so found. Rejecting appellant's claim that Alcoa occupies a "dominant position" in the production of aluminum and aluminum wire and cable products, it found that Alcoa's position in these fields has "declined markedly in recent years" (App. B, Fdg. 15; App. A, 28a-29a). In primary aluminum production, the court found, Alcoa's market share had fallen from 52 per cent in 1948, to 45 per cent in 1956, to 36 per cent in 1960 (App. A, 11a). In ACSR and bare aluminum cable, the court found an even steeper drop: from 48.4 per cent in 1954, to 32.5 per cent in 1958, and, combined with Rome, to 26.1 per cent in 1961, nearly three years after the acquisition (App. A,

[4] In 1958, Rome sold these same products using copper as the conductor metal in the amount of approximately $2 million (AR 56).

12a). These substantial declines, the increase in the number of competing producers, and the decline in Alcoa's rate of return on invested capital from 9.3 per cent in 1950 to 3.7 per cent in 1961 were among the factors which led the court to conclude that Alcoa's position "is something less than dominant" (App. A, 21a, 28a-29a).

(c) Alcoa's Market Disadvantage

The court found (App. A, 12a), and appellant concedes (J.S., 9), that the recent increase in demand for covered or insulated aluminum products found Alcoa in an unfavorable market position since it lacked insulating capabilities. In 1952, as a partial solution, it entered into a tolling arrangement under which Rome made aluminum covered line wire and multiplex cable for Alcoa's account (App. B, Fdgs. 19 and 21). By the time of the acquisition, Alcoa had acquired the ability to make these two simple products (App. B, Fdg. 21), but, as the court found, still lacked the know-how and facilities "to manufacture the more complicated types of insulated wire and cable . . ." (App. A, 21a). Accordingly, as appellant concedes, "Alcoa could not offer customers a full line of its own insulated products, both aluminum and copper, as could certain of its competitors" (J.S., 9-10).

In the face of this competitive disadvantage and Alcoa's declining market position, the court found that "[t]he need for product diversification was apparent" (App. A, 21a-22a). Since the time and expense involved "seemed to foreclose" developing the required insulating competence from within its own organization, Alcoa approached and, on March 31, 1959, acquired Rome (*ibid.*). "Alcoa's purpose," the court found (App. B, Fdg. 7)

was to acquire the ability to manufacture the more complicated insulated wire and cable products and diversify its operations. *Rome's manufacture of aluminum products did not induce said acquisition.* [Emphasis added.]

In short, its objective was "to overcome a market disadvantage rather than to obtain a captive market . . . or to eliminate a competitor" (App. A, 22a).

2. THE PROCEEDINGS IN DISTRICT COURT

On February 5, 1962, after approximately 22 months of extensive pre-trial discovery, the four-week trial of this action commenced. At the trial, the court received more than 500 documentary exhibits and heard and observed more than 50 witnesses, among them engineers and purchasing agents for public utilities, experienced wire and cable technical, sales and managerial personnel, and defendants' executive officers chiefly responsible for the acquisition. Following the trial, the parties filed briefs and proposed findings of fact, submitted memoranda dealing specifically with the application of *Brown Shoe* to this case, and presented oral arguments.

On January 28, 1963, the court filed its Opinion and Findings of Fact and Conclusions of Law and dismissed the Complaint. With respect to the two alleged lines of commerce involved in this appeal[5]—aluminum

[5] Ten "lines of commerce" were asserted at the trial: (1) Aluminum conductor wire and cable; (2) Bare aluminum cable and ACSR; (3) Insulated or covered aluminum wire and cable; (4) Aluminum ingot and rod used in the production of aluminum conductor wire and cable; (5) Conductor wire and cable (aluminum and copper); (6) Conductor wire and cable, bare (aluminum and copper); (7) Wire and cable, insulated and covered (aluminum and copper); (8) Service drop cable (aluminum and copper); (9) Conduit (aluminum and steel); (10) Aluminum conduit.

conductor wire and cable and insulated aluminum wire and cable—the court held (1) that they were not proper lines of commerce and (2) even assuming that they were proper lines, the prohibited anticompetitive effect had not been shown.

The crucial line of commerce determination—that insulated aluminum wire and cable is not properly segregable from insulated copper wire and cable—was based on findings that the industry does not recognize insulated aluminum wire and cable as a separate economic entity (App. A, 15a; App. B, Fdgs. 25 and 26); that manufacturers of insulated wire and cable "switch readily" from one conductor metal to another, using the same machinery and personnel on both copper and aluminum (App. A, 15a; App. B, Fdgs. 27, 55 and 56);[6] that insulated copper and insulated aluminum products are functionally interchangeable and are sold by the same vendors to the same customers for the same end use (App. A, 15a-16a; App. B, Fdg. 28). Evidence of a copper-aluminum price differential, the court found, did not destroy the conclusion that there is "actual competition" between copper and aluminum insulated products (App. A, 16a). Purchasers consider "numerous economic factors in addition to the cost of the wire or cable itself" and "substantial quantities" of copper insulated products are sold in direct competition with aluminum products for the same end use (App. B, Fdgs. 28 and 29).

---

[6] The fact that the manufacture of aluminum insulated products does not require unique production facilities, a fact relied on heavily by the court below, was entirely omitted from appellant's statement of the grounds of decision below (J.S., 12), notwithstanding that the Government, itself, stressed manufacturing interchangeability in the *Brown Shoe* case.

In concluding that the Government failed to prove the prohibited effect on competition in the alleged aluminum conductor lines of commerce, assuming each to have been established, the court relied on a variety of factors, including what "actually happened in the competitive market" in nearly three years after the acquisition (App. A, 32a). It refused to condemn the acquisition solely on the basis of market share statistics since such data not only showed Rome's shares to be comparatively small but demonstrated continuous and substantial declines in Alcoa's pre-acquisition market share and in the Alcoa-Rome combined share after the acquisition (App. A, 25a, 31a; App. B, Fdg. 45). The nonstatistical evidence established, *inter alia*, that Alcoa's purpose was to overcome the market disadvantage resulting from its lack of insulating capability and product diversity, not to obtain a captive market or eliminate a competitor (App. A, 21a-22a, 37a; App. B, Fdg. 7); that there was not substantial or vigorous competition between Alcoa and Rome prior to the acquisition (App. A, 32a; App. B, Fdg. 52); that there is complete and demonstrated ease of entry (App. A, 24a; App. B, Fdgs. 54-58); that neither competitors nor purchasers have been or expect to be adversely affected in any way by the acquisition (App. A, 27a-28a, 32a-33a; App. B, Fdgs. 59-66); and that there has been and continues to be vigorous competition in the manufacture and sale of aluminum wire and cable products (App. A, 33a; App. B, Fdg. 69).

ARGUMENT

This appeal challenges the district court's application of amended Section 7 to two alleged aluminum conductor lines of commerce. Since the trial court ruled against the Government on both the line of com-

merce and competitive effect issues, the appeal must fail if the court can be sustained as to either issue. In this Motion, adopting the Government's order of proceeding, it will be demonstrated, first, that the Government's contentions as to competitive effect are wholly without substance, even assuming the two alleged aluminum conductor lines could be established. In Part II, it will be shown that the district court was clearly correct in rejecting both of the alleged aluminum conductor lines.

I. NO SUBSTANTIAL QUESTION IS PRESENTED BY APPELLANT'S CONTENTIONS ON THE COMPETITIVE EFFECT ISSUE

In the face of clear and unchallenged findings establishing, *inter alia,* lack of any adverse effect on purchasers, competitors, or the public, absence of anti-competitive purpose, complete ease of entry, substantial pre and post-acquisition market declines, and undiminished vigor of competition, appellant is forced to advocate the following strictly quantitative, *per se* test of illegality (J.S., 14):

> in an industry already characterized by a high degree of concentration, the acquisition by the leading company of one of its few substantial independent competitors is a violation of Section 7, for in that setting, the effect of such an acquisition *necessarily* "may be substantially to lessen competition." [Emphasis added.]

The premises of this test are contradicted by the facts: in the ACSR and aluminum cable, bare, line of commerce, where Alcoa was the leading supplier, Rome was so insubstantial a competitor that appellant has abandoned that line; in the insulated aluminum field, where Rome was not *de minimis,* Alcoa was not

"the leading company," lagging substantially behind its rivals not only in sales but in technical competence and product diversity as well.

Furthermore, while appellant avoids using the expression "*per se*," its use of synonyms, such as "necessarily" (J.S., 14), "these facts themselves" (J.S., 20), and "these facts alone" (J.S., 24), clearly indicates that it is advocating a *per se* test of illegality. In the *Philadelphia Bank* case, however, decided after appellant had filed its Jurisdictional Statement, this Court refused to adopt such an absolute *per se* test. Instead, it formulated a rule creating a rebuttable presumption of illegality on the basis of statistics as to market shares and increase in concentration resulting from a merger. "Specifically," the Court said (31 L.W. at 4662)

> a merger which produces a firm controlling an undue percentage share of the relevant market, and results in a significant increase in the concentration of firms in that market, is so inherently likely to lessen competition substantially that it must be enjoined in the absence of evidence clearly showing that the merger is not likely to have such anti-competitive effects.

The *Philadelphia Bank* case not only is dispositive of the Government's *per se* approach but strongly supports appellees' position. First of all, from the statistical standpoint, the market shares and increase in concentration attributable to this acquisition are far below levels suggested in the *Philadelphia Bank* opinion as possible bases of presumptive illegality. Secondly, there is here overwhelming market and historical evidence of the type deemed relevant in the *Brown Shoe* and *Philadelphia Bank* cases which affirmatively establishes that the acquisition is not likely to have the prohibited effect upon competition.

A. Market Share and Concentration Statistics Do Not Establish the Prima Facie Illegality of this Acquisition

Because of the "comparatively small percentages of the market which Rome held" and the substantial post-acquisition declines in the Alcoa-Rome market share, the court refused to condemn the acquisition on the basis of market statistics alone (App. A, 31a-32a). Analysis of these statistics for the two alleged aluminum conductor lines involved in this appeal will demonstrate that this acquisition is well outside of any area of *per se* or presumptive illegality, even assuming that the district court erred in its line of commerce determinations.

(1) Aluminum Wire and Cable, Insulated or Covered

As to this alleged line of commerce, appellant's basic premise that Alcoa was "the leading company" is demonstrably false. Alcoa, with 11.6 percent of total 1958 shipments, ranked a poor third, more than 60 per cent behind Kaiser, with 26.8 per cent, and more than 30 per cent behind Anaconda, with 16.9 per cent (App. B, Fdg 45; Gx 436). Moreover, not only did Alcoa lag far behind quantitatively, but it lacked the technical competence needed to make complementary insulated products, including copper products (App. A, 21a).

Analysis of the market share statistics makes plain that the court was absolutely correct in refusing to give controlling importance to such data (see App. B, Fdg. 45). Alcoa's share in 1958 was 11.6 per cent, and Rome's 4.7 per cent. The sum, 16.3 per cent, is not only far below the 30 per cent conservatively computed in *Philadelphia Bank,* but is substantially beneath the 20 to 25 per cent figures suggested as a test of *prima facie* unlawfulness by the economists cited in footnote

41. 31 L.W. at 4662. Moreover, the significance of the acquisition, considered solely in statistical terms, becomes even more tenuous in light of the substantial post-acquisition decline from a combined high of 16.6 per cent in 1959, to 14.8 per cent in 1960, and to 13 per cent in 1961. Thus, on the basis of the latest information available to the court, the market share of Alcoa-Rome combined is only 1.4 percentage points above the share held by Alcoa alone in 1958. This approaches *de minimis* (cf. *Tampa Electric Company* v. *Nashville Coal Company*, 365 U.S. 320, 328 (1961)) and certainly does not constitute a percentage increase sufficient to create *prima facie* illegality.

Appellant's claim that the acquisition enhances an already "high degree of concentration" (J.S., 14) has little application to the so-called insulated aluminum wire and cable line. Concentration percentages must be used with some discretion.[7] Here, such percentages have little or no competitive significance for the so-called "industry" excludes numerous fabricators presently making copper but not aluminum insulated products (App. B, Fdg. 81). Since wire and cable manufacturers "switch readily" from one conductor metal to another as market conditions dictate, and are constantly considering whether it would be profitable to do so (App. B, Fdgs. 27, 55 and 56), it is evident that

---

[7] As the Senate Subcommittee on Antitrust and Monopoly warned in its publication, *Concentration in American Industry*, 85th Cong. 1st Sess., p. 4 (1957):

> Bare statistics necessarily omit many qualitative factors which are essential to a complete understanding of the competitive structure of the entire industrial economy or of an individual industry.

any anti-competitive effect of undue concentration in this "line" would be promptly offset.[8]

In any event, even taking the statistics at face value, this acquisition has not produced a "significant increase" in concentration. Prior to the acquisition, Alcoa ranked third; after the acquisition, the Alcoa-Rome combination was still third, and still substantially behind Kaiser and Anaconda (Gx 436). Moreover, the aggregate share of the five integrated producers has remained virtually unchanged. Starting at 65.4 per cent in 1958, it rose to 68.1 per cent in 1959, an increase of 2.7 percentage points. By the end of 1961, the same five companies accounted for 66.5 per cent, an increase of only 1.1 percentage points over 1958. Such increases in concentration not only are far below the 33 per cent increase deemed significant in the *Philadelphia Bank* case, but also are substantially below the 7 or 8 percentage point increase suggested by Professor Bok as a possible statistical test. See *United States* v. *Philadelphia National Bank, supra,* footnote 41.

Thus, it is clear that in this crucial alleged line of commerce the statistics fail to show that the merger has produced either "an undue percentage share" or "a significant increase in . . . concentration." Accordingly, there is not presumptive or *per se* illegality.

---

[8] The competitive importance of this complete manufacturing interchangeability is demonstrated by the substantial increase in the number of companies supplying aluminum as well as copper products since 1951. The court found that this "gradual decentralization," which has seen the number of fabricators supplying aluminum insulated products increase from four to 29, greatly lessened the significance of the concentration statistics relied on by the Government (App. A, 22a-24a).

(2) Aluminum Conductor Wire and Cable

Appellant's second alleged line of commerce is nothing but a mathematical composite of (1) aluminum wire and cable, insulated or covered, and (2) ACSR and aluminum cable, bare. With respect to item (1), as just shown, the market percentages are not sufficient to establish *per se* or presumptive illegality. As to item (2), appellant is even weaker and does not challenge the district court's conclusion that the prohibited effect on competition has not been shown.[9]

The chief function of the composite line is to conceal the following infirmity in appellant's case: In bare aluminum, where Alcoa, though rapidly declining, was admittedly the leader, Rome was *de minimis;* in insulated aluminum, where Rome was more than *de minimis,* Alcoa, handicapped by its lack of insulating competence and product diversity, was not the leading company. Appellant's attempt to resurrect its statistical case by adding together bare and insulated aluminum shipments is nothing but a numerical trick since bare aluminum products are not even claimed to be competitive with insulated aluminum products, and "aluminum conductor wire and cable" is not recognized in the industry as a separate economic entity or submarket (App. C, Add'l Fdg. 4). In essence, the composite line is simply a device for inflating the

[9] In the bare aluminum line of commerce, Alcoa, with 32.5 per cent of the market in 1958, was the leading supplier. Rome, however, had only a .3 per cent market share and produced only a limited range of sizes (App. A, 30a). Moreover, the evidence shows a steady and substantial decline in Alcoa's position: From 48.4 per cent in 1954, to 32.5 per cent in 1958, and combined with Rome, to 26.1 per cent in 1961 (App. B, Fdg. 45). It was on the basis of these data, together with the market and historical evidence to be discussed below (pp. 17-22), that the court found for appellees.

market shares by capitalizing on Alcoa's position in ACSR and aluminum cable, bare, even though appellant no longer claims any prohibited effect in the bare aluminum line of commerce, itself.

In any event, the statistical evidence makes clear that the district court correctly refused to invalidate this acquisition solely on the basis of market share and concentration data. Such statistics show, first of all, that Alcoa's 27.8 per cent in 1958 was composed predominantly (more than 90 per cent) of ACSR and bare aluminum cable, while Rome achieved its still very minor position, 1.3 per cent in 1958, largely by virtue of its insulated aluminum sales.[10] Since insulated and bare aluminum products are used for different purposes and are not competitive with each other, these percentages clearly do not manifest any "inherently anticompetitive tendency." *Philadelphia Bank,* 31 L.W. at 4663.

Secondly, and even more important, the statistical evidence establishes a continuing and substantial de-

[10] The actual sources of the percentages relied on by appellant are exposed by the following table (based on App. B, Fdg. 45; Gx 434, 435, 436):

1958
(Thousands of Pounds)

		Alcoa		Rome	
	Total	Shipments	% of Total	Shipments	% of Total
ACSR and Aluminum Cable, Bare	175,157	56,990	32.5	537	0.3
Aluminum Wire and Cable, Insulated or Covered	51,346	5,970	11.6	2,411	4.7
Aluminum Conductor Wire and Cable	226,503	62,960	27.8	2,948	1.3

cline in Alcoa's market position which, by a considerable margin, has more than offset the small and purely numerical increase attributable to the Rome acquisition.[11] Thus, the Alcoa-Rome combined share at the end of 1959 was 28.4 percent, which is only .6 of a percentage point above Alcoa's 1958 share and is 14.4 percentage points *below* Alcoa's 1954 share. By 1961, the Alcoa-Rome combined share was 18 percentage points below Alcoa's 1954 share and 3 percentage points below its 1958 share. In sum, by the time of trial the share of this alleged line held by Alcoa and Rome combined was more than 10 per cent below the share held by Alcoa alone in 1958 and more than 40 percent below Alcoa's 1954 share.

In light of this substantial and continuing decline, it cannot even be suggested that this acquisition has produced any significant increase in either market shares or concentration. Accordingly, the court's rejection of a *per se* standard and its unwillingness to give controlling weight to the market share statistics in this spurious "line of commerce" were manifestly correct.

---

[11] The extent of the decline is shown by the following table (based on App. B, Fdg. 45):

	Alcoa and Rome Individual Percentages					
	1954		1958		1961	
	Alcoa	Rome	Alcoa	Rome	Alcoa	Rome
ACSR and Aluminum Cable, Bare	48.4	0.2	32.5	0.3	26.1	..
Aluminum Wire and Cable, Insulated or Covered	10.0	6.9	11.6	4.7	7.3	5.7
Aluminum Conductor Wire and Cable	42.8	1.1	27.8	1.3	23.5	1.3

B. The Market and Historical Facts Affirmatively Establish the Absence of a Probable Anti-Competitive Effect

At the trial, appellees did not rest their defense solely on Rome's relatively minor position and Alcoa's steady and significant declines in the alleged aluminum conductor lines. Instead, they offered testimony from informed public utility purchasing agents, competing wire and cable fabricators, and Alcoa and Rome officials. This evidence, and the undisputed findings based thereon, affirmatively establish that this acquisition is not likely to have the prohibited effect on competition.

(1) The Absence of Significant Competition Between Alcoa and Rome

The court found that "prior to the acquisition, there was not substantial or vigorous competition between Alcoa and Rome in the sale of aluminum conductor wire and cable products" (App. B, Fdg. 52; App A, 32a). This finding is supported in part by records systematically maintained by Alcoa which show that while Alcoa lost substantial conductor business to other competitors during the two years preceding the acquisition, "its loss of business to Rome during the same period was insignificant" (App. A, 32a).[12] Furthermore, Alcoa and Rome had only relatively few common customers for the overlapping aluminum conductor products.[13] This virtual absence of competition between Alcoa and Rome is explained primarily by the

---

[12] Specifically, out of nearly 80 million pounds of electrical conductor business reported lost to competition, less than 40,000 pounds or about 5/100 of 1 per cent (.05 per cent) was reported lost to Rome (Tr. 1284-1316; AR 29 and 29a).

[13] Appellant concedes that in 1958 only 10 out of the more than 3,300 public utility companies made significant purchases (i.e., more than $1,000) of the overlapping aluminum products from both Alcoa and Rome. (Defts.' Prop. Fdg. 48, agreed to by appellant.)

fact that Rome had only *de minimis* sales of ACSR and bare aluminum cable which constituted more than 90 per cent of Alcoa's wire and cable sales (App. B, Fdgs. 14, 17, 18 and 45).

(2) The Lack of Effect on Competitors

Prior to trial, the Government maintained that this acquisition made it "more difficult for the remaining non-integrated producers to compete and survive" for "[t]hey now must face a competitor whose dominance in the field has been substantially increased . . ." (Trial Brief of the U. S., p. 65). At the trial, this contention was interred by the concrete and unequivocal testimony of nonintegrated fabricators. This testimony, appellant concedes, established that such companies have increased their aluminum wire and cable sales since the acquisition, and have either built new plants or expanded existing plants in order to increase their capacity for making such products (Defts.' Prop. Fdg. 52 (a), (b), (c) and (e), agreed to by appellant). No such manufacturer, the court found, had suffered any adverse effect, nor did any foresee any future adverse effect as a result of this acquisition (App. B, Fdg. 50; App. A, 33a). Statistical evidence showing a marked increase in the nonintegrated producers' aggregate market share since the acquisition confirms the oral testimony and further demonstrates that competition is not likely to be impaired through a withering away of nonintegrated fabricators.[14]

[14] The figures show that in the period from 1958 to 1961, the nonintegrated producers, as a group, have increased their market share in insulated or covered aluminum from 29.8 per cent to 33.5 per cent, during which time the Alcoa-Rome share declined from 16.3 per cent to 13 per cent, and that their share in the composite line has remained substantially unchanged while the Alcoa-Rome share has declined from 29.1 per cent in 1958 to 24.8 per cent in 1961 (App. A, 32a).

(3) Ease of Entry

The court's finding that "no serious impediment or barrier" to entry exists is abundantly supported by the record. (App. A, 24a). Indeed, the term "entry" is a misnomer for, as the court found, fabricators already in the wire and cable business—of which there are upwards of 200, "among them many strong, well financed and highly reputable concerns" (App. B, Fdg. 81)—"switch readily from one product or conductor metal to another in accordance with market conditions . . ." (App. B, Fdg. 56). Since a fabricator of copper products can "readily" make aluminum products "with its existing machinery and personnel" (App. B, Fdgs. 27, 55; App. A, 15a), clearly "entry" is a simple matter. Moreover, this is not just a theoretical possibility, for when the price of copper rose in the early 1950's, creating favorable opportunities for aluminum conductor products, the number of suppliers increased "from four to twenty-nine and most of the new entrants came from the ranks of insulated copper conductor producers . . ." (App. A, 24a). This fact, the court found, is "indicative that entry into the aluminum conductor field is dictated by the status of the competition rather than being controlled by actual economic barriers" (*ibid.*).

(4) The Absence of a Significant Merger Trend

Contrary to *Brown Shoe*, where the district court found definite and substantial acquisition trends in which *Brown Shoe*, itself, was a "moving factor" (370 U.S. at 302), the court here found neither a "significan pattern or trend of mergers" for the industry as a whole (App. B, Fdg. 46), nor any prior "history of acquisitions or mergers" by Alcoa (App. A, 23a).

The court's finding as to the lack of any significant merger trend is strongly supported by the record. Olin Mathieson, a partner in a relatively new primary aluminum producing joint venture, was not even in the wire and cable business prior to its acquisition of Southern Electrical;[15] U. S. Rubber, which was acquired by Kaiser in 1957, was less than a 1 per cent factor in aluminum conductor products; and Roebling, whose wire and cable machinery was acquired by Reynolds, never was more than a .1 per cent factor and is conceded by appellant not to have been a substantial independent competitor (App. A, 23a; App. B, Fdg. 48; J.S. 23). The minor importance of these acquisitions, together with the demonstrated post-acquisition declines of the merging companies (App. B, Fdg. 48), fully supported the court's conclusion.

Appellant's concern about "creeping concentration" is likewise entirely misplaced insofar as Alcoa is concerned. Alcoa has achieved its objective in obtaining insulating know-how, does not contemplate "future expansion through mergers or acquisitions" in the wire and cable field (App. B, Fdg. 11), and, therefore, there is no indication that Alcoa will seek to expand its "power by successive small acquisitions . . ." (S. Rep. 1775, 81st Cong. 2d Sess. 5, quoted J.S. 20).

---

[15] The acquisition of Central Cable by Aluminium, Ltd., which is referred to by appellant, though completely *dehors* the record, also did not elminate or lessen competition since Aluminium was not previously in the wire and cable business. The same is true as to Harvey Aluminum Company, which appellant asserts has considered acquiring a wire and cable producer (J.S., 19).

(5) The Lack of Anti-Competitive Purpose

Relying on this Court's assertion in *Brown Shoe* that a most important factor is "the very nature and purpose of the arrangement," 370 U.S. at 329, the court gave weight to the fact that Alcoa acquired Rome in order to diversify its operations, not "to obtain a captive market for its product or to eliminate a competitor" (App. A, 22a), nor because Rome manufactured aluminum products which Alcoa already was selling (App. B, Fdg. 7). Such findings, while not necessarily conclusive, are highly relevant for, as the Court observed in *Brown Shoe,* 370 U.S. at 329, footnote 48,

> evidence indicating the purpose of the merging parties, where available, is an aid in predicting the probable future conduct of the parties and thus the probable effects of the merger.

(6) The Lack of Effect on Consumers

Finally, recognizing that one test of a competitive market is "whether consumers are well served," *Philadelphia Bank,* 31 L.W. at 4663, footnote 43 appellees offered the testimony of purchasing agents for eight of the ten public utilities which bought aluminum conductor products from both companies prior to the acquistion. These witnesses explained the manner in which they purchased these products, identified their suppliers before and after the acquisition, and described Rome's position and practices. As the court found, these witnesses "all testified without exception that the acquisition has not had an adverse effect upon the purchasers of such products"; "that no difficulty has been encountered in expanding their list of suppliers and that competition among such suppliers has not been affected" (App. A, 28a); and that prior to the acquisition, Rome was a follower rather

than an initiator of price reductions and "was not an aggressive price competitor" (App. B, Fdgs. 53 and 61). The court concluded that consumers "have not been and will not be adversely affected by the Rome acquisition" (App. B, Fdg. 59).

II. NO SUBSTANTIAL QUESTION IS PRESENTED BY APPELLANT'S CONTENTIONS ON THE LINE OF COMMERCE ISSUE

Although acknowledging that the line of commerce issue "lies at the threshold of every Section 7 case" (J.S., 24), appellant postpones discussion of that issue until near the close of its Jurisdictional Statement. The confession of weakness so clearly implied by this departure from logic is well founded.

The critical line of commerce question for appellant is whether aluminum wire and cable, insulated or covered, is a proper line of commerce. If it is not, then, as appellant concedes, aluminum wire and cable, composed of bare and insulated aluminum products, also is not a proper line of commerce (J.S., 28-29).[16] Accord-

[16] On the other hand, even if insulated aluminum were a line of commerce it would not necessarily follow that the combination of noncompetitive bare and insulated aluminum products is a proper line of commerce. Contrary to appellant's contention (J.S., 28), the fact that the court found "conductor wire and cable," including both bare and insulated, and aluminum and copper, products to be a line of commerce is no support for giving similar recognition to the combination of noncompetitive bare and insulated *aluminum* products. "Conductor wire and cable," the court found, corresponds to the "generally recognized electrical wire and cable industry" (App. B, Fdg. 31). Here, however, contrary to appellant's assertion, the court rejected the so-called aluminum conductor line not only because it failed to include copper equivalents of insulated aluminum products, but also because the evidence failed to show that the combination of bare and insulated aluminum wire and cable "is generally recognized in the industry as a separate economic entity or submarket" (App. C, Add'l Fdg. 4).

ingly, this argument will focus on the alleged aluminum insulated line.

The Government's basic contention is that the district court, in refusing to segregate insulated wire and cable products made with aluminum conductor from the equivalent copper products, misapplied the guidelines laid down by this Court in *Brown Shoe*. None of the court's underlying findings of fact is challenged as "clearly erroneous."

In *Brown Shoe*, this Court, quoting from the *duPont-General Motors* opinion,[17] declared (370 U.S. at 324):

> [d]etermination of the relevant market is a necessary predicate to a finding of a violation of the Clayton Act because the threatened monopoly must be one which will substantially lessen competition "within the area of effective competition." Substantiality can be determined only in terms of the market affected.

It went on to say that the "area of effective competition" must be determined in part by reference to a product market; that there are broad product markets whose outer boundaries are determined by interchangeability of use or cross-elasticity of demand; and that within such broad markets may be "well-defined" and "economically significant" submarkets within which the probable effects of a merger may be measured. 370 U.S. at 325. The Court made no attempt to establish any rigid formula for determining the boundaries of a submarket. Rather, it indicated that a broad ranging and pragmatic evaluation of market realities

[17] *United States* v. *E. I. duPont de Nemours & Co.*, 353 U.S. 586, 593 (1957).

was required. Courts were admonished to examine (*ibid.*),

> such practical indicia as industry or public recognition of the submarket as a separate economic entity, the product's peculiar characteristics and uses, unique production facilities, distinct customers, distinct prices, sensitivity to price changes, and specialized vendors.

In this case, the district court, after obviously conscientious study of *Brown Shoe,* observed that "no rigid formula exists" for determination of the relevant product market, that "the realities of competition are the ultimate test," and that "the existence or nonexistence of each of the above indicia is not determinative of the problem itself" (App. A, 5a-6a). Contrary to the Government's insinuation that the court carelessly and thoughtlessly considered the line of commerce question, and merely "ticked off" the listed indicia (J.S., 24), the court made numerous and detailed findings of fact supporting its ultimate conclusion. On the basis of these undisputed findings, it is readily apparent that it would have been unrealistic for the court to make the further subdivision sought by appellant.

A. The Court's Line of Commerce Findings

At the trial more than a dozen witnesses with long experience in the business testified as to the relationship between copper and aluminum in the wire and cable industry. On the basis of this testimony, together with supporting documentary evidence, the court found that insulated wire and cable manufacturers regard themselves simply as insulators of wire and cable, not as copper insulators on the one hand, or aluminum

insulators on the other (App. B, Fdg. 26), that the industry defines insulated wire and cable products according to function or type, not according to the metal used as conductor (App. B, Fdg. 25),[18] and that, in general, insulated aluminum wire and cable "is not recognized in the industry as a separate economic entity" (App. A, 15a).

One of the most significant facts for determining "the area of effective competition" is that no unique production facilities are required for making aluminum, as opposed to copper, insulated products. Thus, the industry testimony overwhelmingly established, and the court found, that wire and cable manufacturers can draw, strand, and insulate copper and aluminum interchangeably on the same equipment and with the same personnel (App. B, Fdg. 27); that, in fact, such manufacturers constantly review their product lines, and "switch readily" from one product and conductor metal to another in accordance with market conditions (App. B, Fdg. 56); and that manufacturers not presently making aluminum conductor products have considered doing so and would if profitable orders were obtained (*ibid.*). These competitive realities, which accord with industry usage and understanding, clearly place copper and aluminum insulators within a single "area of effective competition."

---

[18] That is, products are designated as "building wire," "power cable," "magnet wire," etc., whether made from copper or aluminum. This finding is amply supported by, among other things, authoritative technical manuals (AR 25-28), the Standard Industrial Classification Manual published by the United States Bureau of the Budget (AR 74), product classifications established by the Bureau of Census (AR 9), and the Wire Buyers' Guide, official publication of the Wire Association (AR 73).

Finally, the court found that aluminum and copper insulated products are sold, "in actual competition" with each other, by the same vendors to the same customers for the same end use (App. A, 15a-16a; App. B, Fdg. 28). This conclusion, the court found, is not destroyed by the existence of a copper-aluminum price differential (App. A, 16a). Cable purchases are not dictated solely by the price of the cable, itself, but involve evaluation of numerous additional economic factors which determine final installed cost (App. B, Fdg. 28). Since such factors—e.g., labor costs, costs of installation materials, costs of connections, salvage value—tend to favor copper,[19] the economic contest is not one-sided. As the court found, "even with respect to" insulated overhead products "where aluminum has gained its greatest acceptance," "substantial quantities are sold using copper as the conductor" (App. B, Fdg. 29).[20]

B. Appellant's Contentions on Line of Commerce Are Without Substance

Appellant contends that the district court erred in making a pragmatic, multi-factor analysis based on all of the *Brown Shoe* indicia. Instead, appellant urges it should have based its determination solely upon the copper-aluminum price differential (J.S., 25, 30), even though, as the court found, such differential does not foreclose "lively," "active," and "actual" com-

---

[19] Deft's Prop. Fdg. 30(a), agreed to by appellant. See also Tr. 1345-54, Tr. 383-89, AR 76.

[20] According to the Government's own evidence, 22.8 per cent of new overhead insulated or covered lines added in 1959 used copper conductor. In dollar terms, this amounted to, conservatively, $15,000,000. Tr. 581-86.

petition between aluminum and copper insulated products (App. A, 10a, 16a). This is a startling position for the Government to take, particularly in view of this Court's holding in *Brown Shoe* that "'price/quality' differences" are not sufficient to segment product lines "where, in fact, competition exists," and where, as here, the other "practical indicia" demonstrate the inappropriateness of further subdividing the market. 370 U.S. at 326.

Typical of the Government's disregard of the competitive realities is its contention that the copper-aluminum price differential imposes a competitive disadvantage on "fabricators of insulated copper cable." "Utilizing a high-cost metal," appellant says, such fabricators (J.S., 27)

> are powerless to eliminate the price disadvantage under which they labor and thus are not in a position to compete effectively in the overhead distribution field.

Even leaving to one side the other economic factors which mitigate the alleged price disadvantage (*supra*, p. 26), this wholly misconceives the court's findings as to the nature of competition in the insulating business.

We are not dealing here with competition between different metals, but with competition among fabricators of insulated wire and cable products. Contrary to appellant's assumption, such fabricators are not captives of one particular metal, but move freely between copper and aluminum, using the same machinery and personnel, in accordance with market conditions (App. B, Fdgs. 27, 55, 56). Should any fabricator of

overhead distribution products feel himself at a competitive disadvantage owing to the use of copper, he is not "powerless" for he can and will use aluminum. Since he will still be making the same product[21] on the same machinery and with the same personnel, and will still be selling to the same utility customers for the same end use, it is completely unrealistic to assert that merely by changing raw material, he thereby transfers from one line of commerce to another.

A similar misconception is involved in appellant's claim that (J.S., 28)

> the availability of a copper substitute exerts little, if any, restraint upon the power of the aluminum cable manufacturers to raise the price of their product.

This contention completely ignores the fact that there is no static group of "aluminum cable manufacturers." On the contrary, as the court expressly found, wire and cable fabricators move freely from one conductor metal to another, and, in a continuing dynamic process, re-evaluate their product lines and consider how their insulating capacity should be allocated between copper and aluminum. In these circumstances, "aluminum cable manufacturers" are subject to rigorous competitive forces which affect the pricing of aluminum cable products; for, in addition to the competition which the court found copper insulated products afford, there is the unavoidable prospect that insulating capacity previously devoted to copper will be used on aluminum if the price of aluminum in-

[21] See note 18, *supra*.

sulated products should increase.[22] The effective restraint stemming from the manufacturing interchangeability and other competitive realities found by the court illustrates why this Court, in *Brown Shoe,* included "separate economic entity," "unique production facilities," and "specialized vendors" among the "practical indicia" to be examined in determining the "area of effective competition." 370 U.S. at 325.

Finally, recognizing that the court's finding that there is "lively," "active," and "actual" competition between copper and aluminum insulated products seriously undermines the economic significance of the alleged copper-aluminum price differential, appellant now contends that at the time of the acquisition (J.S., 27)

> "actual competition" between the two metals in the field of overhead distribution was rapidly disappearing—just as it had already disappeared in the field of overhead transmission, where bare aluminum, having almost completely displaced bare copper, was conceded by Alcoa and found by the court to be a distinct line of commerce.

This goes beyond anything the Government even attempted to prove at the trial and fails to take account of important distinctions between the role of aluminum

---

[22] The magnitude of the competitive restraint imposed by the existence of insulating capacity not presently used on aluminum is indicated by the court's findings that there are "upwards of 200 companies" in the wire and cable business and that such companies produced in 1958 insulated products valued at more than $1.3 billion, only a small fraction of which represented aluminum products (App. B, Fdgs. 29 and 81).

in bare transmission as opposed to insulated or covered distribution products.[23]

(1) At the trial, the Government offered a report (Gx 468) and expert testimony (Tr. 554-89) based on a survey of 93 electric utilities. This evidence indicated that from 1950 to 1959 the use of aluminum conductor in new insulated or covered overhead lines had increased from 6.5 per cent in 1950 to 77.2 per cent in 1959. In addition to seeking information as to actual use in prior years, the questionnaire used in this survey asked the utilities to state whether they "expect any increase or decrease in 1960 and in subsequent years in the proportion of aluminum to copper used in any classification of . . . (overhead lines)" (App. D to Gx 468).

Varying responses, wholly insufficient to establish the nature of any future trend, were received. Accordingly, the Government's expert, both in his written report and in his oral testimony, refused to make any projection of the trend beyond 1959, and candidly stated that information received regarding expected future use of copper and aluminum was "not susceptible to tabulation and was not tabulated in [the] re-

---

[23] In addition, this contention distorts completely the basis of appellee's concession that ACSR and bare aluminum cable may be regarded as a separate line of commerce. That concession was not based solely on the fact that aluminum has substantially displaced copper in the bare transmission field but rested also on a number of additional facts applicable to bare, but not to insulated or covered, aluminum products. Among such additional facts were the technological advantages of bare aluminum over bare copper; that ACSR and aluminum cable, bare, is "generally recognized as a separate product classification"; and that "the manufacture and sale of these products require special stranding equipment and designing skill" (App. B, Fdg. 24).

port" (Tr. 558). Reflecting the absence of probative evidence as to future use of aluminum in insulated or covered distribution products, the Government did not even propose a finding of fact that the trend toward aluminum would continue into the future, let alone that copper-aluminum competition would eventually "disappear" with respect to insulated or covered products.

(2) The Government's claim that copper will be displaced in the insulated or covered field to the same extent as bare copper has been displaced in the overhead transmission field is wholly at variance with the findings and the evidence. In the overhead transmission field, aluminum has positive technical advantages over copper. For example, its lighter weight results in important economies in installation and the larger size required helps to avoid corona loss (e.g., Tr. 282-84). In the insulated field, however, these technological advantages of aluminum do not apply. As the court found, copper and aluminum are "completely interchangeable from a performance standpoint [and] utility companies choose between copper and aluminum insulated or covered overhead products solely on the basis of economics" (App. B, Fdg. 28). In fact, as shown above (p. 26), the nonprice variables tend to favor copper, not aluminum as in the bare transmission field. This explains why a utility company's decision "requires evaluation of numerous economic factors in addition to the cost of the wire or cable itself" (App. B, Fdg. 28), and why, despite the price differential relied on so heavily by appellant, the court found that "substantial quantities" of insulated or covered overhead distribution products are sold using copper conductor (App. B, Fdg. 29).

CONCLUSION

The decision below is correct, and this appeal presents no questions warranting further briefs and oral argument. The judgment of the district court should be affirmed.

Respectfully submitted,

In the Supreme Court of the United States

OCTOBER TERM, 1963

No. 204

UNITED STATES OF AMERICA, APPELLANT

v.

ALUMINUM COMPANY OF AMERICA AND ROME CABLE CORPORATION

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE NORTHERN DISTRICT OF NEW YORK

BRIEF FOR THE UNITED STATES

OPINION BELOW

The opinion of the district court (R. 1305) is reported at 214 F. Supp. 501.

JURISDICTION

The judgment of the district court was entered on January 28, 1963 (R. 1305), and the notice of appeal was filed by the United States on March 29, 1963 (R. 1337). This Court noted probable jurisdiction on October 14, 1963 (R. 3510; 375 U.S. 808).

The jurisdiction of this Court is conferred by Section 2 of the Expediting Act of February 11, 1903, 32 Stat. 823, as amended, 15 U.S.C. 29.

QUESTIONS PRESENTED

The primary question is whether the acquisition of all of the stock and assets of one of the few significant independent fabricators of aluminum conductor wire and cable (Rome Cable) by the largest producer of primary aluminum and aluminum conductor wire and cable (Aluminum Company of America) in an already oligopolistic market violates Section 7 of the Clayton Act.

A subsidiary question is whether aluminum conductor and insulated aluminum conductor are lines of commerce in which the effect of the acquisition may appropriately be judged.

STATUTE INVOLVED

Section 7 of the Clayton Act, 38 Stat. 731, as amended, 64 Stat. 1125, 15 U.S.C. 18, provides in pertinent part:

> No corporation engaged in commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no corporation subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of another corporation engaged also in commerce, where in any line of commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly.

STATEMENT

This is a civil antitrust action by the United States charging a violation of Section 7 of the Clayton Act (15 U.S.C. 18). The complaint, filed on April 1, 1960,

charged that the effect of the 1959 acquisition by the Aluminum Company of America ("Alcoa") of the Rome Cable Corporation ("Rome") "may be substantially to lessen competition or to tend to create a monopoly" in the production and sale of various wire and cable products and accessories. It asked, *inter alia*, for divestiture by Alcoa of all the assets, business and good will acquired from Rome. After a month-long trial ending March 1, 1962, the district court, on January 28, 1963, held that no violation of Section 7 had been established and dismissed the complaint.

1. THE MERGING COMPANIES

Alcoa.—From its incorporation in 1888 until 1940, Alcoa was the sole domestic producer of virgin aluminum ingot and of aluminum conductor wire and cable, *United States* v. *Aluminum Company of America*, 148 F. 2d 416, 422, 423, 438 (C.A. 2). In a celebrated monopoly case, begun in 1937 and extending in its various phases over a period of twenty years,[1] the Second Circuit,[2] per Learned Hand, J., held that Alcoa had monopolized the aluminum industry in violation of Section 2 of the Sherman Act. Relief, however, was deferred pending disposition by the government of the aluminum facilities it had built during World War II, *id.* at 446–447; see *United*

[1] Litigation was terminated on June 28, 1957, *United States* v. *Aluminum Company of America*, 153 F. Supp. 132 (S.D. N.Y.). Twelve days later, on July 10, 1957, Alcoa made its first attempt to acquire Rome (GX 159, R. 2176).

[2] A quorum was wanting in the Court, so that the circuit court acted as the court of last resort, pursuant to the Act of June 9, 1944, 58 Stat. 272.

States v. *Aluminum Company of America*, 91 F. Supp. 333 (S.D. N.Y.); *United States* v. *Aluminum Company of America*, 153 F. Supp. 132 (S.D. N.Y.). The Surplus Property Act of 1944, 58 Stat. 765 (1944) directed that these facilities be distributed "in such manner, and with such purpose, as would foster competitive conditions in the aluminum industry"; thus the War Assets Administration used the government's aluminum properties "as an instrument to create competition rather than * * * to recover the Government's investment", and established domestic competition for Alcoa in the aluminum business. *United States* v. *Aluminum Company of America*, 91 F. Supp. 333, 339, 351–354 (S.D. N.Y.). As a result, Reynolds Metals Company ("Reynolds") and Kaiser Aluminum & Chemical Corporation ("Kaiser") became integrated producers of aluminum and aluminum products. Judge Knox noted in 1950 that the competition they created for Alcoa was "due, almost entirely, to the disposal program of the War Assets Administration." *Id.* at 380. See also *United States* v. *Aluminum Company of America*, 153 F. Supp. 132 (S.D. N.Y.). Since 1950, three more companies—Ormet, Inc. ("Ormet"), Harvey Aluminum ("Harvey"), and Anaconda Aluminum Company ("Anaconda")—have entered the primary aluminum field, with various forms of government assistance (*ibid.*).

Alcoa, however, has continued to be the largest producer of primary aluminum (R. 1312), accounting for 52 percent of the nation's output of primary aluminum in 1948, 45 percent in 1956, and 36 percent in 1960 (R. 1313). The district court used the following

table to indicate the relative productive capacities of Alcoa and the other primary producers in 1960 (R. 1310):

Aluminum Ingot Capacity Existing or Under Construction at the End of 1960

[Short tons]

Company	Capacity	Percent of U.S. total
United States total	2,655,750	100.0
Aluminum Company of America	1,025,250	38.6
Reynolds Metals Company	701,000	26.4
Kaiser Aluminum & Chemical Corp.	609,500	23.0
Ormet, Inc.	180,000	6.8
Harvey Aluminum	75,000	2.8
Anaconda Aluminum Company	65,000	2.4

In addition to primary aluminum, Alcoa fabricates a wide variety of semi-finished and finished products, including sheet, plate, rod, bar, extrusions, castings, forgings, tubing, foil, rivets, closures, screws, electrical conductors and accessories and conduit (Fdg. 12, R. 1284). It is a fully integrated aluminum producer (R. 1306), owning and operating raw material locations, shipping lines, railroads, water companies, electric power companies, coal properties, gas lines, and numerous manufacturing facilities for converting aluminum ore into primary, semi-fabricated, and finished aluminum products (GX 9, R. 1376–1381; GX 49, R. 1625). In 1960, Alcoa's assets were approximately $1,375 million, its gross revenues $870 million, and its net income $40 million (GX 49, R. 1619–1621).

The lines of commerce upon which the merger would bear most heavily are aluminum conductor wire and cable ("aluminum conductor") and insulated or

covered aluminum conductor wire and cable ("insulated aluminum" or "aluminum insulated"). Conductor wire and cable is a major end use of aluminum. Thus, in 1958 the total United States production of primary aluminum ingot was 3,131 million pounds, while 226 million pounds of aluminum conductor were produced, of which 51 million pounds were insulated wire and cable (AR 49 R. 3403; GX 434, R. 2713, GX 436, R. 2717).

It was Alcoa which pioneered the use of aluminum as an electrical conductor and sold substantially all of the aluminum cable used for electrical transmission in the United States prior to World War II (R. 1313). The company's activity in aluminum conductors began in 1899 when it developed and sold the nation's first aluminum transmission line[3] (GX 235, R. 2309). In 1909 an Alcoa engineer invented ACSR (aluminum cable, steel reinforced), which remains today the most popular type of bare aluminum conductor (R. 1054). Alcoa also was first to develop insulated aluminum conductors (GX 235, R. 2310), although in this product line its initial efforts were directed to promoting fabrication by other wire and cable manufacturers (see R. 1054; R. 1077). One of Alcoa's five research laboratories[4] is devoted entirely to the development of new products and processes for

[3] Electric utility power systems usually distinguish between (1) "transmission lines," which carry electricity at high voltages from generating plants to substations in areas of consumer demand; and (2) "distribution lines," which carry the electricity at reduced voltages from substations to consumers. (See AR 12, R. 3246, and R. 297.)

[4] Exclusive of the Rome Research Center, discussed *infra*, p. 10.

electrical conduction (GX 7, R. 1346), and the company offers "outstanding" technical service to its aluminum conductor customers (R. 187). In addition, Alcoa is the only domestic manufacturer of a full line of aluminum conductor accessory products, an important companion line to aluminum conductor wire and cable (R. 393–397). Other complementary items made by Alcoa include transmission towers, substation structures, conduit, bus conductors, and architectural products (GX 7, R. 1346; R. 1596).

There was testimony that, prior to the acquisition of Rome, Alcoa had never merged with another company and the court below apparently so found (R. 1322, 1108).[5] Subsequent to the Rome acquisition, however, Alcoa acquired Cupples Products Corporation, a fabricator of aluminum architectural products (GX 48, R. 1584);[6] and Rea Magnet Wire Company, Inc., a manufacturer of magnet wire, with sales of $25 million in 1959 (*ibid.*; GX 41, R. 1567; GX 44, R. 1572). Alcoa's unwillingness to duplicate the expertise, facilities, and marketing organization it had acquired from Rome, and also the pendency of this antitrust litigation, discouraged further acquisitions. Thus Alcoa rejected merger proposals it received from other manufacturers of wire and cable.

---

[5] But see *Aluminum Company of America* v. *Federal Trade Commission*, 284 Fed. 401 (C.A. 3), and *United States* v. *Aluminum Company of America*, 44 Supp. 97, 106, 188–189 (S.D.N.Y.)

[6] The government is presently attacking this merger as a violation of Section 7 of the Clayton Act. *United States* v. *Aluminum Company of America*, Civil No. 61 C 147(2) (E.D. Mo.).

(R. 959–960; R. 1109–1111; GX 250–254, R. 2352–2357; GX 261, R. 2362; GX 264–266, R. 2373–2375)

In 1958, the last year prior to the merger, Alcoa was the leading producer of aluminum conductor, with 27.8 percent of the market (GX 434, R. 2713). In the field of insulated and covered aluminum conductor, Alcoa ranked third, with 11.6 percent of the market (GX 436, R. 2717). In bare aluminum conductor and ACSR—the other component of the broader aluminum conductor line—Alcoa led the industry with 32.5 percent of the market, (GX 435, R. 2715).

Rome.—Rome Cable Corporation was incorporated in 1936 and began business in Rome, New York, as a fabricator of copper conductor wire and cable. By the time it was acquired twenty-three years later, Rome had acquired two additional plants, at Collegeville, Pennsylvania, and Torrance, California, and had grown into one of the nation's largest and most important independent fabricators of aluminum and copper wire and cable products. One year after its incorporation, Rome reported assets of $1.9 million and annual sales of $1.8 million; on March 31, 1958, a year before its acquisition, Rome's assets had increased to $24 million and its annual sales to $40.6 million (GX 9, R. 1400, 1405, GX 17, R. 1493, GX 47, R. 1577). In the five years preceding the acquisition, Rome's sales averaged $47 million annually (GX 7, R. 1346).

Rome enjoyed an excellent reputation in the trade because of its broad range of high-quality aluminum and copper conductor and accessory products, its

high degree of technical skill, and its substantial achievements in research and development. It was not only a substantial producer of aluminum conductor (GX 436, R. 2717), but also one of the nation's ten largest manufacturers of copper conductor (R. 1314). It produced both bare conductor and "a diversified line" of insulated conductor, both copper and aluminum, as well as companion products such as conduit and cable support devices. This range of conductor and accessory products compared favorably with the offerings of other independent fabricators, was much broader than Alcoa's, and constituted an important competitive asset—one which Alcoa was particularly eager to acquire (R. 33, 393, 473, 666, 1055, 1057, 1077; Fdg. 16, R. 1285; Fdg. 21(a)(b), R. 1286–1287; GX 7, R. 1346; GX 158, R. 2171; GX 161, R. 2179, 2183).

Rome possessed an outstanding marketing organization, with a nationwide network of salesmen, warehouses and distributors. While it was not the company's policy to initiate price-cutting, Rome was, in the words of its president, an "aggressive competitor" (R. 937; see GX 227, R. 2273). Following the merger, the marketing of all electrical conductor and conduit produced either by Alcoa or by Rome plants was assigned to Rome personnel (R. 1063–1064; GX 6, R. 1343, R. 1536; GX 52, R. 1743; GX 370, R. 2533). Thus, all of Alcoa's aluminum conductor products—products in which it had led the industry for a number of years—were henceforth to be distributed by Rome's sales organization.

In other ways, too, Rome was a leading wire and cable company. It began operations as the only independent conductor fabricator with its own copper rod-rolling mill (R. 930; GX 52, R. 1742); and was one of the first fabricators of copper wire and cable to develop facilities for the production of aluminum rod (GX 52, R. 1742). As one of four independent fabricators which were integrated backward through the aluminum rod-making stage (R. 226, 403–404; R. 545; R. 991), Rome produced both aluminum and copper rod for its own use and for resale to others (Fdg. 16, R. 1285). Thus while most independents must buy aluminum rod, an intermediate product, for drawing into wire, Rome was able to buy aluminum ingot, the primary product—a significant competitive advantage (R. 72, 545).

Rome was also noted for its outstanding research activities and technical know-how, particularly in the field of insulated aluminum conductors (R. 1073, 1314, 1321; GX 7, R. 1346). It was Rome which developed the most popular service drop cable in use today (R. 671–673, 936). In the year before the merger, the company opened the Rome Research Center, a $675,000 faciilty, to expand its research program and stimulate the development of new products (GX 7, R. 1346; GX 132, R. 2057).

In 1958, Rome shipped approximately $21.2 million worth of copper conductor wire and cable (Fdg. 68, R. 1296) and $2.2 million worth of aluminum con-

ductor wire and cable (Fdg. 68, R. 1296). It accounted for 1.3% of the market in aluminum conductor (Fdg. 45(a), R. 1292; GX 434, R. 2713), .3% in bare aluminum and 4.7% in insulated aluminum conductor (Fdg. 45(a), R. 1292; GX 435, R. 2715; GX 436, R. 2717). At the time of its acquisition, Rome employed approximately 1,500 persons. Its stock, held by about 2,500 persons, was traded on the New York Stock Exchange (GX 7, R. 1346). In the decade prior to the merger, Rome had acquired the assets of T. J. Cope, Inc., a Pennsylvania manufacturer of cable support devices, and of the Anderson-Carlson Manufacturing Co. of Torrance, California, whose plant Rome subsequently used for the manufacture of electrical conduit (R. 930; GX 23, R. 1511; Fdg. 16, R. 1285; GX 9, R. 1369–1370).

2. THE ALUMINUM CONDUCTOR INDUSTRY

The products.—In 1958, the national output of aluminum conductor wire and cable (aluminum conductor) was 226 million pounds, consisting of 175 million pounds (77 percent) of bare aluminum cable and ACSR (bare aluminum conductor) and 51 million pounds of insulated and covered[7] aluminum con-

[7] In the trade, an "insulated" conductor bears a larger amount of insulating material than a "covered" conductor. The insulating material on a "covered" conductor is primarily designed to fend off external damage, such as might result from contact with trees, although it also provides some degree of protection against the escape of electricity; the thicker insulating material on an "insulated" conductor renders complete protection against the escape of electricity.

ductor wire and cable (insulated aluminum conductor) (GX 434–436, R. 2713–2718). These products are designed almost exclusively for use by electric utilities in carrying electric power from generating plants to consumers throughout the United States. Copper is the only other material utilized commercially for the same general purpose. However, each metal has found, or is in process of finding, those particular utility applications for which it is peculiarly fitted from a commercial standpoint.

The 3,300 operating electrical utilities which presently purchase such wire have developed clear patterns of use for copper cable and for aluminum cable, both in transmission lines (the "wholesale" lines which carry current at high voltages to substations) and distribution lines (the "retail" lines which route the electricity at reduced voltages from the substations to the consumers). Both types of lines are usually strung above ground, except in heavily congested areas, such as city centers, where they are run underground. Underground, where the conductor must be heavily insulated, copper has always been and remains today virtually the only conductor used (GX 468, R. 2746). Overhead, where transmission and some distribution lines are bare and other distribution lines are less heavily insulated, aluminum has "virtually displaced," or is rapidly displacing, copper conductor in all except seacoast areas, where aluminum's vulnerability to corrosion bars its use (R. 65, 173–176, 207–

209, 224, 392–393, 630–632, 997; Fdg. 24, R. 1288; GX 468, R. 2737, 2740; GX 469, R. 3205; GX 474, R. 3206). By 1950, 74.4 percent of all additions to overhead transmission lines were being constructed with bare aluminum conductor or ACSR (aluminum cable, steel reinforced); by 1959, this figure had increased to 94.4 percent (GX 468, R. 2740). As the district court found, bare aluminum conductor "has practically displaced copper for use in overhead transmission lines" (R. 1316). For ease of reference, the rapid changover from copper to aluminum in the two overhead fields is charted in the following table (GX 468, R. 2740):

Percent of Aluminum Conductor in Gross Additions to Overhead Utility Lines

	1950	1955	1959
Transmission Lines (All Bare Conductor)	74.4%	91.0%	94.4%
Distribution Lines, Bare Conductor	35.5	64.4	79.0
Insulated Conductor	6.5	51.6	77.2
Total, Transmission and Distribution Lines	25.0	60.9	80.1

Aluminum conductor has achieved its present stature as the dominant overhead conductor primarily because, in both bare and insulated forms, it is substantially cheaper than comparable copper conductor (R. 63, 160–161, 177–178, 182, 210, 218–219, 297–299, 390–393, 1225–1229). For example, as of January 1, 1961, the prevailing price of a representative insulated aluminum weatherproof conductor was $73.50 per 100 feet, while a copper conductor of equivalent conductivity cost $115.83. Similarly, a representative aluminum service drop cable and its copper equiv-

alent cost $114.00 and $206.00, respectively (R. 1228, 1229). This price differential is a function of the peculiar characteristics and disparate prices of the two primary metals. One pound of aluminum conducts the same amount of electricity as two pounds of copper (R. 182; GX 50, R. 1650; GX 366, R. 2510).[8] Thus, even were the prices of aluminum and copper identical, pound for pound, aluminum is still only half as expensive a conductor metal (R. 160, 182).[9]

In addition to the substantial price advantage of aluminum conductor over copper conductor, the cost of a completed overhead line constructed with aluminum is less than the cost of a comparable line constructed with copper. This is so, whether the overhead line is bare or insulated (R. 210, R. 298–299).[10]

---

[8] Aluminum is roughly a third as heavy as copper but possesses about 62 percent of the conductivity of copper; as a result, an aluminum cable will be larger in volume but lighter in weight than a copper conductor of equivalent conductivity (R. 974; GX 32, R. 1543; GX 50, R. 1650; GX 366, R. 2512–2513).

[9] For a comparison of aluminum and copper prices see GX 467, R. 2736. It is notable that the price of aluminum has remained reasonably steady while the price of copper has been subject to rapid and substantial fluctuations (R. 50, 548, 1072; GX 9, R. 1365; GX 373, R. 2546).

[10] A 1959 study by the Consolidated Edison System of New York City concluded that for "relatively short extensions" of 300 to 2000 feet to existing copper overhead lines, and for service drop cable, "there appears to be little, if any difference between the [completed] costs of aluminum extensions

While the price of the aluminum conductor is the measure of its over-all economic advantage in overhead distribution lines, there are additional sources of savings in overhead transmission lines—notably, aluminum's lighter weight (per given conductivity), which allows the use of fewer supporting structures, and its larger area, which reduces corona loss (the escape of electricity into the atmosphere) (R. 161–162, 298).

For a utility to switch from copper to aluminum or vice versa is an expensive undertaking. Aluminum and copper conductors differ in strength, resistance to nicking, tendency to extrude under pressure, flexibility, and other technical characteristics (R. 185–186, 419–420; GX 32, R. 1543; GX 50, R. 1713–1714, 1727, 1729–1731). Because of the galvanic corrosion

---

and copper extensions at the current cable prices and with available splicing techniques" (AR. 76, R. 3472). Accordingly, Xenis, an engineer for Consolidated Edison, testified that the company "[was] not saving money" in using aluminum for overhead distribution, despite the lower cost of the conductor itself (R. 712). He went on to say, however, that the system covering New York City is "not exactly typical", that the "little pieces" it adds to its overhead system are shorter than the additions or new construction undertaken by other distribution systems, and that savings in completed line cost resulting from the use of aluminum increase with the length of the new line (R. 713, 714, 716). Moreover, in 1960, a year after this study was made, Consolidated Edison switched to insulated aluminum conductor for service drop cable, to "take advantage of the savings which * * * were in favor of [aluminum] service drops" (R. 712).

between the two metals, it is impossible to connect one to the other without specially designed connectors (R. 176). Accordingly, a shift from one conductor metal to the other requires the retraining of line crews in new installation techniques, the use of special connectors, the warehousing of a new stock of cable replacements, and the redesigning of construction specifications (R. 173, 176, 186, 213–215). Utilities, therefore, do not "flip back and forth from one conductor to another" (R. 212). They would abandon aluminum and return to copper only if the relative prices of the two metals altered sufficiently to reverse the present relationship of completed line costs, and even then only if they were convinced that the reversal would be reasonably permanent (R. 212, 301). No such development is anticipated in the foreseeable future (R. 212–213, 217, 299).

In electrical conductor applications other than overhead transmission and distribution, aluminum has physical disadvantages which prevent it from competing effectively with copper. As one utility executive explained (R. 300):

> [W]here aluminum has advantages aside from price * * * is in transmission overhead. Underground, aluminum, aside from price, has only disadvantages. Because of its greater size for given conductivity it requires more insulation. Insulation is expensive. So the non-conductor part which is a material part in cables [is] where the costs concerned have increased. Its

> greater size tends to require larger ducts which are expensive so it has no inherent advantage in use for underground cable. In fact, it has inherent disadvantages * * *.

Thus, for underground transmission and distribution of electricity, and for communication cable, aluminum is seldom employed (R. 176, 183, 211–212, 997–998, 2741). Moreover, its larger size and greater brittleness discourage its use in magnet wire and fine wire applications (e.g., electrical coils and motor windings (R. 433–435, 998)), shipboard cable (R. 419), switchboard and control cable (R. 420–421), battery cable and other automotive wiring (R. 221), flexible cords (R. 223, 275, 999; GX 267, R. 2380), portable power cable (R. 420; GX 375, R. 2580), or welding cable (R. 420). Because of its larger size and the connection problems it raises, aluminum has gained only limited acceptance in the building wire field (R. 235, 274, 418–419, 539). In short, while aluminum conductor now dominates the overhead field, copper remains virtually unrivaled in all other conductor applications.

As the district court found, aluminum and copper conductors sell at different prices and there is no price sensitivity between them (R. 63, 392, 435–436, 1316; see GX 467, R. 2736). Each conductor responds to changes in the price of its primary metal, but not to changes in the price of the other conductor (R. 391, 435–436, 506; 857–858; GX 354–355, R. 2465).

Differences in the economics of aluminum and copper conductors were reflected in appellees' agency agreements, which employ separate categories, and provide for different sales terms and commission rates for each conductor (GX 233, R. 2302; GX 243, R. 2343; GX 270–274, R. 2383–2398; GX 365, R. 2502; GX 369, R. 2528). Some of appellee's distributors handle only copper conductors while others are primarily concerned with aluminum conductors (GX 370, R. 2533).

Finally, Alcoa and other aluminum conductor fabricators concern themselves with competition from one another but do not follow in the same fashion the sales successes of copper conductor fabricators (R. 412, 683–684, 686; GX 353, R. 2462; AR. 29a, R. 3343).

The structure of the industry.—As previously noted, in 1958, the year prior to the merger, Alcoa was the largest producer of aluminum conductor, with 27.8% of the market, and the third largest producer of insulated aluminum conductor, with a market share of 11.6% (Fdg. 45(a), R. 1292). In the same year, Rome's market shares were 1.3% in aluminum conductor and 4.7 % in insulated aluminum conductor (*ibid.*). Thus, the merging companies together accounted for 29.1% of aluminum conductor and 16.3% of insulated aluminum conductor (*ibid.*). In 1961, three years later, Alcoa-Rome, operating as a single company, accounted for 24.8% of the aluminum con-

ductor market and 13.0% of the insulated aluminum conductor market (*ibid.*).[11]

In 1958 sales of aluminum conductor were distributed as follows. (GX 434, R. 2713):

Alcoa	27.8%
Kaiser	23.1%
Anaconda	15.8%
Reynolds	10.4%
General Cable	6.0%
Olin Mathieson	4.5%
Essex	4.5%
Southwire	2.3%
Rome	1.3%
Total, above nine companies	95.7%
All other producers	4.3%

Thus, the five integrated producers (Alcoa, Kaiser, Reynolds, Anaconda, and Olin Mathieson)[12] accounted for 81.6% of the market (see GX 438, R. 2719; cf. R. 1322), while four fabricators (General Cable, Essex, Southwire, and Rome) shared an additional 14.1%.

[11] In 1954, Alcoa's share was 42.8 percent of aluminum conductor and 10.0 percent of insulated aluminum conductor; in the same year Rome's shares were 1.1 percent and 6.9 percent, respectively (Fdg. 45(a), R. 1292).

[12] Ormet, Inc., a primary aluminum producer, is one-half owned by Olin Mathieson (GX 438, n. 5, R. 2720).

In the field of insulated aluminum conductor, a similar pattern of concentration prevailed, with 1958 sales distributed as follows (GX 436, R. 2717):

Kaiser	26.8%
Anaconda	16.9%
Alcoa	11.6%
General Cable	9.5%
Essex	6.1%
Olin Mathieson	5.3%
Reynolds	4.8%
Rome	4.7%
Southwire	2.5%
Total, above nine companies	88.2%
All other producers	11.8%

The five integrated producers thus accounted for 65.4% of insulated aluminum conductor and the four listed independents for another 22.8%.

While the district court found that there were 29 producers of insulated aluminum conductor in 1961 (Fdg. 54, R. 1294), only 11 of the companies referred to by the court [13] had market shares of 1% or more in 1959, the latest year for which statistics are available: Kaiser (23.8%), Anaconda (18.8%), Alcoa-Rome (16.6%), General Cable (10.4%), Olin Mathieson (4.5%), Reynolds (4.4%), Essex (4.1%), Southwire (3.9%), General Electric (1.5%), Circle (1%), and Central.[14] Of the other listed companies,

[13] The finding of 29 insulated aluminum companies is based upon AR 5 (R. 3229), a Commerce Department directory.

[14] The market shares of all but the last of the listed companies appear in GX 436 (R. 2717). Central, which supplied the government no information concerning its sales, is assumed to have been a substantial producer of both aluminum conductor and of insulated aluminum conductor (R. 75, 387).

three had 1959 market shares of less than one percent;[15] one (Westinghouse) produced less than 100 pounds of insulated aluminum conductor; and another (Western Electric) produced none at all (GX 436, R. 2717–2718). By the time of trial, five more listed companies (Crescent, Triangle, Collyer, Hudson, and Narragansett) were out, or "almost completely out," of the field (R. 242–243, 273, 422–423, 433, 536–537), while another seven (Belden, Electric Auto-Lite, Hatfield, Kerite, National Electric Products, Simplex, and Surprenant) did not make the aluminum conductor products principally used in overhead distribution lines (R. 1245, 1087–1088). The last of the 29 listed companies, Texas Wire and Cable Co., is the defunct subsidiary of Narragansett, *supra* (R. 536–537, 546).

The district court also found that more than 200 companies manufacture and sell electrical wire and cable (Fdg. 81, R. 1299). This total, however, includes all companies engaged in any phase of the business, *e.g.*, the manufacture of enameled magnet wire or submarine cable (AR 71, R. 3425; AR 73, R. 3441). Appellees listed but 21 companies as producers of the aluminum or copper insulated conductors principally used in overhead lines (R. 1245).

In the period 1955–1961, there was a substantial increase in the portion of the aluminum conductor and the insulated aluminum conductor markets shared by integrated producers. In 1955 the three then

[15] Hendrix (.9%), Okonite (.6%), and Walker Bros. (.3%) (GX 436, R. 2717–2718).

existing primary aluminum producers (Alcoa, Reynolds, and Kaiser) accounted for 66.5% of the aluminum conductor market (GX 438, R. 2719). By 1958, five integrated producers (Alcoa, Reynolds, Kaiser, Anaconda, and Olin Mathieson) accounted for 81.6% of that market (ibid.). These same companies shared 82.1% in 1961 (AR 61, R. 3412). In the insulated aluminum conductor field, three integrated companies had 39% of the market in 1955, and five had 65.4% and 66.5% in 1958 and 1961, respectively (GX 440, R. 2723; AR 60, R. 3411). These increases—15.6 percentage points in aluminum conductor and 26.4 percentage points in insulated aluminum conductor—resulted, in part, from (1) the backward integration of Anaconda, a wire and cable fabricator which expanded into primary aluminum production in late 1955 (GX 438, R. 2719); and (2) a series of acquisitions by primary producers of previously independent aluminum conductor fabricators.

In 1957, Olin Mathieson acquired Southern Electrical Corporation, an independent which in the previous year had market shares of 8.1% in aluminum conductor and 6.1% in insulated aluminum conductor (Fdgs. 47–48, R. 1293; GX 434, 436, R. 2713, 2717). Also in 1957, Kaiser acquired the Bristol, Rhode Island, wire and cable plant of the U.S. Rubber Company, which in 1956 accounted for .8% of aluminum conductor shipments and 3.2% of insulated aluminum conductor shipments (*ibid.*).[16] The Alcoa-

[16] The government has filed suit to invalidate this merger under Section 7 of the Clayton Act. *United States* v. *Kaiser Aluminum and Chemical Corporation*, Civil No. 2795 (D. R.I.).

Rome merger came in 1959, and in 1961, partially in response to the Olin-Southern, Kaiser-Bristol and Alcoa-Rome mergers, Reynolds acquired the wire and cable facilities of John A. Roeblings' Sons Division of the Colorado Fuel and Iron Company, a small fabricator (Fdgs. 47–49, R. 1293; GX 387, R. 2606; GX 396, R. 2620). Finally, in February 1963, after the district court had rendered its decision in this case, Aluminium Ltd., a Canadian primary producer, announced the acquisition of Central Cable Corporation, a substantial independent (see n. 14, p. 20, *supra*)."[17]

The independent fabricators have experienced difficulties in competing against the integrated producers. From time to time, they have been affected by shortages of aluminum (R. 384, 387, 492–493, 958) and by "price squeezes," *i.e.*, reductions in the price margin between primary or semi-finished aluminum and fabricated aluminum conductor (R. 69, 389–390, 399–402, 411–412, GX 96, R. 1940; GX 245, R. 2345; GX 422–433, R. 2699–2712; AR 57, R. 3407). Alcoa has been cognizant of "the problem of selling ingot or intermediate products to customers who were also competitors in the sale of the finished product" (R. 1113; see GX 191, R. 2231), and through its pricing policy has attempted, unsuccessfully, to maintain an adequate margin for independent fabricators (R. 1113–1116; see also R. 832–833; cf. R. 1119–1120 and GX 191, R. 2231). Nonetheless, between 1955 and 1961, a number of fabricators discontinued, or materially curtailed,

[17] Another primary aluminum producer, Harvey Aluminum Company is presently considering entry into the aluminum conductor field by acquisition of an existing manufacturer (R. 474).

their aluminum conductor production because of inability to operate profitably within this price margin.[18] During this same period of time, only one new producer [19] entered the aluminum conductor field (other than by acquisition) (GX 442, R. 2727), and three existing independents expanded their production facilities (R. 75, 406, 984–985). One of the three was Central Cable Corporation, since acquired by an integrated producer (*supra*, p. 23).

3. THE MERGER

The Alcoa-Rome merger had its genesis in the early 1950's, when aluminum conductor was first coming into its own (GX 468, R. 2740). In 1950–1951, when both copper and aluminum were scarce, Rome was one of eight producers to receive government allocations of aluminum for the fabrication of insulated conductor (R. 695, 937). Rome thereupon entered the aluminum conductor field and began fabricating covered line wire and service drop cable from bare aluminum cable which it purchased readymade (R. 696; GX 54, R. 1761). As copper prices increased

[18] Collyer, which in 1956 produced 258,145 pounds of aluminum conductor, both bare and insulated, produced 56,463 pounds in 1960 (R. 422). Triangle, which produced 368,000 pounds of aluminum conductor in 1956, entirely discontinued aluminum conductor production in 1961 (R. 242–243). The aluminum conductor production of Essex experienced a substantial decline, beginning in 1959 (R. 225–226). Narragansett, which in 1956 organized and equipped a subsidiary corporation, Texas Wire and Cable Co., to make insulated aluminum conductor, abandoned the enterprise before production even began (R 536–537). See also the experience of Crescent (R. 273).

[19] Hatfield Wire and Cable Division of Continental Copper and Steel Industries, Inc.

(GX 467, R. 2736) and aluminum conductor became more popular (GX 468, R. 2740), Rome expanded its aluminum conductor operations. In 1953 it began drawing its own aluminum wire and stranding its own aluminum cable (R. 696); by late 1953 it was making its own aluminum rod, selling both a full line of covered aluminum line wire and service drop cable, and a limited line of bare aluminum conductor (R. 697; GX 80, R. 1867; GX 86, R. 1901).

Also in the early 1950's Alcoa determined that it was "dragging behind in the parade" because it lacked a line of insulated aluminum conductor (R. 1077). Lacking the technical skills necessary to make this product unassisted, it approached Rome. In late 1951, Alcoa's vice president for sales visited the chairman of Rome's board of directors, and, as he described it:

> * * * told him we were lamentably behind * * * in covered insulated wire and cable and asked him if we could make some arrangement whereby they, Rome Cable, would supply us with technical assistance and know how. (R. 1078.)

Ensuing discussions with Rome convinced Alcoa that the manufacture of insulated conductor was even more difficult than it had assumed (GX 71–72, R. 1836–1847); accordingly, it postponed plans to make insulated aluminum conductor on its own (GX 76, R. 1854). Instead, on March 7, 1952, it entered into a "tolling" arrangement with Rome, under which bare aluminum conductor would be shipped by Alcoa to Rome, fabricated by Rome into polyethylene and

neoprene covered line wire and service drop cable, and returned to Alcoa for sale as an Alcoa product (R. 1078; GX 28, R. 1536). Pursuant to this arrangement, Rome produced all of Alcoa's insulated aluminum conductor until 1955. In that year Rome made 4,349,000 pounds of insulated aluminum conductor (10.8% of the market) for sale by Alcoa and 2,728,000 pounds (6.9%) for its own sales (GX 436, R. 2717).

In 1955, Rome increased its neoprene insulating facilities at Alcoa's request (GX 30–31, R. 1538–1539) and at the same time expanded its own aluminum conductor operations independent of the tolling arrangement. In that year it launched a program to increase its aluminum conductor capacity and to double its aluminum rod-making capacity (GX 52, R. 1750; GX 96, R. 1938; GX 98–99, R. 1943–1944; GX 102, R. 1954; GX 104–105, R. 1977)—a program which was nearly completed two years later (GX 128, R. 2040). In addition to its insulated aluminum activities, Rome produced and actively solicited sales of ACSR (GX 81, R. 1870; GX 85, R. 1899).[*] Moreover, on a number of occasions between its entry

[*] In December 1958, a month before the merger was arranged, Rome applied to the Tennessee Valley Authority for a position on its approved list of ACSR suppliers, and an inspection of Rome's facilities was arranged by T.V.A. (R. 163). The immediate purpose of the request was to enable Rome to become an approved supplier of ACSR to the Knoxville Utilities Board and other southeastern utilities (R. 759–760, 785–786; GX 134, R. 2074; GX 135, R. 2076; GX 136, R. 2077). This request was withdrawn following the merger. (R. 163; GX 183–186, R. 2225–2227).

into aluminum conductor and its acquisition, Rome gave serious consideration to the expansion of its ACSR and bare aluminum cable production (R. 940–941; GX 91, R. 1922, 1924; GX 102, R. 1952; GX 118, R. 2010).

In 1955 Alcoa determined that its insulated aluminum conductor operations should become independent of Rome. As a first step in that direction, it installed equipment to fabricate polyethylene insulated cable and, by 1958, was able to satisfy most of its polyethylene requirements from its own production (R. 1079, 1096–1097; GX 141, R. 2092; GX 146, R. 2097). The second step was to be the installation of neoprene insulating equipment; with both polyethylene and neoprene insulating capacity, Alcoa would have been completely independent of Rome for insulated aluminum conductor. Beginning in 1957, Alcoa made neoprene studies,[11] and by March 1959, when Rome was acquired, it had already allocated funds for neoprene equipment and was considering a further allocation (R. 1079–1080; GX 155, R. 2165; GX 156, R. 2168; GX 269, R. 2382)."

Alcoa's plans for expansion in insulated conductor were not, however, limited to polyethylene and neoprene types. In 1957, as previously noted, Kaiser acquired the Bristol plant and Olin Mathieson acquired Southern Electrical (*supra*, p. 22). With these mergers, Alcoa believed its "No. 1 spot" in aluminum conductors to be endangered, particularly

[11] Following the merger, these expenditures were cancelled (R. 1131–1132; GX 155–156, R. 2165–2168).

by Kaiser, since Alcoa still lacked a full line of aluminum and copper conductors of its own manufacture (GX 150, R. 2127; GX 161, R. 2179; GX 168, R. 2193). It was felt that a full line was necessary (1) to diversify Alcoa's conductor business and allow it to satisfy all of its customers' requirements (R. 1055, 1080); (2) to attract and retain good distribution outlets (R. 1055); and (3) to encourage the expanded use of aluminum in insulated conductors, thereby enlarging the conductor market for primary aluminum (R. 1054, 1080).

Of the two methods by which it could obtain a full line—internal expansion or merger—Alcoa considered the latter to be easier, faster, less expensive, less risky, and less "obnoxious" to its competitors (R. 1056–1058, 1089, 1104; GX 162, R. 2185). Accordingly, Alcoa first attempted merger (R. 1059). Rome, with its excellent personnel and technical know-how was considered to be the best acquisition Alcoa could make and its absorption "the answer to the present Kaiser threat to push Alcoa out of first place in the electrical conductor field" (GX 161, R. 2183; see also GX 158, R. 2171). Thus, in October, 1957, Alcoa offered $24,000,000 in Alcoa stock in an unsuccessful attempt to acquire Rome (R. 951, 952; GX 165, R. 2190). Similar efforts—these, too, unsuccessful—were made to acquire other companies (GX 398–408, R. 2621–2640).

When it appeared that all of Alcoa's merger attempts had failed, it turned its attention to internal

expansion. In October 1958, Alcoa's president ordered that plans begin for—

> * * * a rounded out program well beyond the neoprene stage and a program which * * * would * * * keep us in the No. 1 spot in the aluminum conductor field, and, if necessary, a sufficient factor in the copper field to help maintain the No. 1 position in the aluminum field. (R. 1061; GX 168, R. 2194; see also GX 169, R. 2195.)

An Alcoa task force worked out plans for a new plant to produce insulated aluminum and copper conductor, setting as its target 5% of the insulated wire and cable market (GX 170–173, R. 2195–2206; GX 175, R. 2206; GX 178, R. 2208). It was anticipated that this expansion program would have cost about $35–$40 million and taken five to ten years to accomplish (R. 1089–1090, 1126). These plans, however, were never passed upon by Alcoa management (R. 1064),[22] for merger negotiations were renewed with Rome and this time proved successful (R. 952). On March 31, 1959, 355,226 shares of Alcoa stock, worth about $34 million, were exchanged for all the assets of Rome (Fdg. 6, R. 1284; GX 7, 1345; GX 9, R. 1427).[23] Since that time Rome has been operated as an Alcoa subsidiary (Fdg. 4, R. 1283).

---

[22] Alcoa's vice president for sales testified that he would not have recommended approval of this program (R. 1090); Alcoa's president did not testify as to what his decision on the program would have been (R. 1056–1057; but see GX 169, R. 2195).

[23] The transfer was accomplished through the formation by Alcoa of a subsidiary corporation, the Rome Cable Corpora-

4. PROCEEDINGS BELOW

The government's complaint, filed April 1, 1960, charged that the acquisition violated Section 7 of the Clayton Act because of its impact upon competition in various conductor and accessory product lines (R. 1). Pending final adjudication on the merits, the district court enjoined Alcoa from encumbering the stock of its Rome subsidiary, and from further transferring operations from Rome to any other plants of Alcoa. At trial, the government claimed that the forbidden anticompetitive effect would be felt in ten "lines of commerce", only two of which—aluminum conductor (consisting of both bare and insulated types) and insulated aluminum conductor—are involved in this appeal.

After trial, the district court dismissed the complaint (R. 1304). The court concluded that aluminum conductor and insulated aluminum conductor were not appropriate submarkets for assessing the impact of the merger, and that in any event the merger lacked the prohibited anticompetitive effect in any asserted line of commerce (Conc. 3, 8, R. 1302, 1303; R. 1316–1317, 1333).

The court found bare aluminum conductor and ACSR to be a "line of commerce" within the meaning of the statute (Conc. 2, R. 1301–1302; R. 1316). But it denied this status to insulated aluminum conductor, finding that the latter is functionally inter-

---

tion of Delaware, to which was transferred all the assets, business and good will of the Rome Cable Corporation of New York. The New York corporation was thereupon liquidated.

changeable with insulated copper conductor, that the purchase and use of insulated aluminum or insulated copper is dictated principally by economic factors, that insulated aluminum conductor and its copper equivalent can be produced by the same facilities, and that insulated aluminum conductor is not recognized in the industry as a separate economic entity, has no distinct customers, and lacks specialized vendors (R. 1316). Although finding that the aluminum and copper products sell at different prices and that these prices are not sensitive to one another, the court concluded that insulated aluminum conductor is "in actual competition with its copper counterpart", and therefore could not be considered a "line of commerce" (*ibid.*). Having so concluded, the court further held that aluminum conductor (the broader product group including both insulated and bare aluminum conductor) "cannot result in a line of commerce" (*ibid.*), since a line of commerce cannot be composed of two parts, one of which independently qualifies as a line of commerce and one of which does not.

Turning to the issue of probable competitive effect, the district court found that Alcoa's purpose in acquiring Rome was to secure the special competence which Rome had developed in the insulated cable field and which Alcoa admittedly lacked (R. 1321); that the concentration of about 80 percent of the aluminum cable market in the five integrated producers "loses its significance when it is realized that the production of aluminum and the fabricating of its products were concentrated to the point of a monopoly

less than twenty years ago and has undergone a gradual decentralization by the entry of new producers and fabricators since that time" (R. 1322); and that acquisitions in the aluminum cable field by other integrated producers, which preceded and followed the Alcoa-Rome merger, do not constitute a "significant pattern or trend of merger," especially in view of the post-merger declines suffered by the merging parties (*ibid.*; Fdg. 46–48, R. 1293).

The court found no serious barriers to entry in the insulated aluminum market, noting that the number of producers had increased in ten years from four to twenty-nine, and that most of the new entrants had come from the copper field (R. 1323). It also relied upon the absence of any complaints concerning the "actual or potential effect of the acquisition upon suppliers and purchasers," and upon testimony from certain aluminum cable competitors and purchasers that no adverse effect had been felt (R. 1326, 1330). Finally, taking into account the declining market shares held by Alcoa, both before and after the Rome acquisition,[24] a decline in the rate of return on Alcoa's invested capital, and the increase in the number and market shares of other primary aluminum producers and cable fabricators, the court concluded that Alcoa does not enjoy a "dominant" position (R. 1327).

[24] See *supra*, pp. 18–19.

SUMMARY OF ARGUMENT

I

If the Alcoa-Rome merger stands, its principal effects will be felt in the aluminum conductor and the insulated aluminum conductor markets. Both product groups are appropriate lines of commerce distinguishable from their copper counterparts largely on the basis of price. For overhead transmission and distribution of electricity, aluminum conductors (both bare and insulated) are substantially cheaper than comparable copper conductors. Moreover, aluminum and copper prices are unrelated and unresponsive to each other. As a result, aluminum has rapidly become the dominant overhead conductor. In all other conductor applications, however, copper remains the dominant conductor. Aluminum's price advantage is restricted to the overhead field and its physical characteristics constitute substantial impediments to its use elsewhere. That aluminum and copper conductors possess such distinct end uses, as a result of these economic differences, is sufficient to distinguish them as separate Section 7 lines of commerce.

II

Taking aluminum conductor and insulated aluminum conductor as the appropriate lines of commerce,

we base our attack upon the merger upon two propositions:

First, Alcoa is a leading firm in markets in which economic power is already highly concentrated.

Second, any acquisition of a significant competitor by one of the few dominant firms in a market in which economic power is already highly concentrated may tend "substantially to lessen competition" within the meaning of Section 7 of the Clayton Act, even though the acquired firm has only a relatively small share of the market.

A. There can be no doubt either as to Alcoa's leading position or as to the highly concentrated character of the relevant product markets. In aluminum conductor, the broader line of commerce, Alcoa led the industry with a premerger market share of 27.8%. With its leading integrated competitor (Kaiser), it controlled 50% of the market; with its three leading competitors, more than 76%; only nine concerns—the five primary aluminum companies plus four independents (including Rome, with 1.3%)—accounted for 95.7% of the output of aluminum conductor. No other company whose statistics appear in the record claimed as much as 1% of the market. In the narrower market—insulated aluminum conductor—a similar pattern prevailed, except that Alcoa's third ranking share was somewhat lower (11.6%) and Rome's somewhat higher (4.7%).

B. The critical proposition upon which the present case turns, is that Section 7 is violated by any acquisition of a significant competitor by one of the leading firms in a market in which economic power is highly

concentrated, even though the acquired company's share of the market is relatively small. That proposition was endorsed in *United States* v. *Philadelphia National Bank*, 374 U.S. 321, 365, n. 42, where this Court stated that "if concentration is already great, the importance of preventing even slight increases in concentration and so preserving the possibility of eventual deconcentration is correspondingly great." That principle is dictated by the basic purposes of the 1950 amendments to Section 7 and is supported by the following reasons:

1. An acquisition such as this threatens competition by enhancing the power of a concern which already controls an undue share of the market. On the eve of the acquisition, Alcoa controlled 27.8% of the aluminum conductor market; the acquisition added 1.3%. In the *Philadelphia Bank* case, this Court observed that a market share of 30% by the combined merging companies clearly represented an undue threat to competition, and it noted, citing the views of economists, that a smaller percentage might also be excessive.

2. In an industry where the number of sellers is few, the competitive significance of each company is correspondingly great and transcends its bare market percentage. In the present case the market shares of the acquired company—1.3% in aluminum conductor and 4.7% in insulated aluminum conductor—may not appear great in absolute terms, but loom larger when it is observed that in the aluminum conductor market there were not more than a dozen companies which could account for as much as 1% of

industry production in any one of the five years for which statistics appear in the record. Rome was consistently one of those companies. In addition, Rome, though not a price innovator, was nonetheless shown to be an "aggressive competitor." Its broad line of high-quality wire and cable products, its special aptitude and skills in the field of insulation, and its "active and efficient research department and sales organization"—all acknowledged by the court (R. 1313)—had earned it an outstanding reputation in the industry. The effectiveness of its marketing organization is testified to by the decision of Alcoa to make Rome the vehicle for distributing not only the insulated conductor in which Rome was the acknowledged specialist, but the entire conductor line of both companies. Enterprises of such demonstrated quality and high repute cannot easily be replaced by new entrants to the market, and their elimination is plainly a substantial loss to competition.

3. The presence in the market of small but significant concerns such as Rome is important not only as a check upon the dominant leaders in a concentrated market, but also because it preserves the possibility of eventual deconcentration. If the leaders can buy up small competitors before they have an opportunity to grow, justifying the purchase on the ground that the statistical change in market shares is quantitatively small, then it is easy to perpetuate oligopoly and preclude any possibility of the restoration of greater competition.

4. If, as *Brown Shoe Co.* v. *United States*, 370 U.S. 294, makes clear, a small acquisition in a highly dispersed industry is banned by the statute on the ground that it might constitute a step on the road to oligopoly, a comparable or more substantial acquisition by a leading company in an industry which is much further along that road plainly stands upon no better footing. Indeed, the more advanced the oligopoly, the more objectionable each step becomes and the more urgent that the policies of the Clayton Act be brought into play. In an oligopolistic industry, moreover, there is an inherent likelihood that an expansionary move by any of the few dominant firms will induce a defensive or retalitory counteraction by its principal competitors. That very process is unfolding in the aluminum conductor fields, where the absorption of Rome by Alcoa was one of the five acquisitions by producers of primary aluminum since 1957.

ARGUMENT

The primary issue in this case concerns the standards to be followed in applying Section 7 of the Clayton Act to a significant acquisition by the industry leader in an already highly oligopolistic product market. At the threshold, however, there is a controversy as to the appropriate product markets—"lines of commerce"—in which to test the impact of the merger upon competition. In Point I, we deal with the threshold question—the scope of the relevant markets. In Point II we come to the question whether, in those markets, the acquisition may have had the anti-competitive effect banned by the statute.

I

ALUMINUM CONDUCTOR AND INSULATED ALUMINUM CONDUCTOR ARE APPROPRIATE "LINES OF COMMERCE" WITHIN WHICH TO APPRAISE THE IMPACT OF THE MERGER

In the district court the government contended that the acquisition of Rome by Alcoa eliminated competition in a number of product markets and submarkets, all within the general field of conductor wire and cable. Some of these markets—including (1) conductor wire and cable (both bare and insulated, aluminum and copper), (2) insulated conductor (both aluminum and copper), and (3) bare aluminum conductor—were conceded by the defendant and found by the court to constitute "line[s] of commerce" within the meaning of the statute, but the requisite anti-competitive effect was found wanting. We do not argue against these conclusions here. In this appeal, our attack upon the merger is confined to two product lines: insulated aluminum conductor and aluminum conductor generally (both bare and insulated). As to each of these, the district court held (a) that the aluminum product was not a "line of commerce" separate and distinct from its copper counterpart, and (b) that in any case there was no reasonable probability that the acquisition would result in a substantial lessening of competition.

A. INSULATED ALUMINUM CONDUCTOR IS A "LINE OF COMMERCE"

In holding that insulated aluminum is not a submarket competitively distinct from insulated copper, the court below misapplied the guidelines laid down

by this Court in *Brown Shoe* v. *United States*, 370 U.S. 294. Ticking off the "practical indicia" listed in *Brown Shoe*, the court noted that producers do not regard the aluminum product as "a separate economic entity"; that the same equipment can be used to produce either the copper or the aluminum product; that both are sold to the same customers (electric utilities); that there are no specialized vendors; and that, as a technical matter, the insulated copper product can be used wherever insulated aluminum is used. On the other hand, the court recognized that in the only application for which insulated aluminum is widely used—overhead distribution lines—the customers make their purchases solely on the basis of economic factors; that aluminum conductors are sold at prices distinct from copper; and that there is little price sensitivity between them. These latter factors, which we regard as decisive, were dismissed by the court on the ground that they did not destroy the conclusion "that covered aluminum wire and cable is in actual competition with its copper counterpart and may not be found as a line of commerce herein" (R. 1316). Apparently, therefore, the court considered that a finding that two products are "in actual competition"—without considering the degree of competition—necessarily precludes a ruling that either constitutes a separate line of commerce. This represents a clear misunderstanding of the *Brown Shoe* decision.

In *Brown Shoe*, the Court carefully pointed out (370 U.S. at 325) that while the outer boundaries of a product market must be broad enough to embrace all reasonably interchangeable substitutes, within those

boundaries there may exist well-defined submarkets which are themselves lines of commerce. This means, obviously, that two or more products—*e.g.*, insulated aluminum cable and insulated copper cable—though sufficiently competitive to be grouped together within a single product market, may at the same time be sufficiently noncompetitive to be treated as distinct submarkets. In other words, the degree of competitiveness which serves to justify the inclusion of several items in the same product line of commerce does not necessarily preclude their division into separate submarket lines. The district court plainly failed to appreciate this point, for it characterized as an "inconsistent position" the government's contention that "insulated aluminum wire and cable is a line of commerce and therefore competitively distinct from insulated copper but * * * that insulated aluminum and insulated copper constitute a single line of commerce" (R. 1317). If the lower court's view were correct, the distinction drawn in *Brown Shoe* between broad product markets and lesser included submarkets would be completely obliterated.

Had the court applied the proper standard, it could not have failed to recognize insulated aluminum conductor as a line of commerce distinct from its copper counterpart. The record establishes that insulated aluminum and insulated copper are competitive only in the general sense that both are used as conductors of electricity. In most applications, insulated aluminum is so intrinsically inferior to insulated copper that it enjoys virtually no consumer acceptance. (See pp. 16–17, *supra*). In the field of overhead dis-

tribution, however, aluminum has rapidly become the dominant conductor. For that purpose it is functionally interchangeable with insulated copper, but enjoys a decisive economic advantage, because primary aluminum is cheaper than primary copper and, pound for pound, will carry twice as much electricity. Consequently, the price of most insulated aluminum conductors is only 50 to 65% of the price of equally conductive copper products (R. 1225–1229), and the installed costs of overhead lines are also substantially less when insulated aluminum conductors are used (R. 210; R. 298–299). Because of this substantial price differential, aluminum has dramatically displaced copper in insulated overhead distribution lines, its share of total annual installations increasing from 6.5% in 1950 to 77.2% in 1959, the last year for which statistics were available at the trial (*supra*, p. 13). As of the date of the merger, therefore, "actual competition" between the two metals in the field of overhead distribution was rapidly disappearing—just as it had already disappeared in the field of overhead transmission, where bare aluminum, having almost completely displaced bare copper, was conceded by Alcoa and found by the court to be a distinct line of commerce.

The district court apparently gave considerable weight to the fact that in 1959 insulated copper conductor still comprised 22.8% of the gross additions to insulated overhead distribution lines (Fdg. 29, R. 1289; R. 1316), and to that extent remained a competitor. Had the change-over from insulated cop-

per to insulated aluminum progressed further by 1959, the court would presumably have recognized the latter as a separate submarket, for it found bare aluminum to be a "line of commerce" largely on the ground that it had "practically displaced copper for use in overhead transmission lines" (R. 1316; Fdg. 24, R. 1288). Yet the only real difference between the two processes of displacement is that the substitution of bare aluminum for bare copper in overhead transmission started much earlier; by 1950 bare aluminum already accounted for 74.4% of all additions to overhead transmission lines, while insulated aluminum amounted to only 6.5% of new overhead distribution lines. The record reveals an unmistakeable trend away from insulated copper in the overhead distribution field, which was just beginning in 1950, and still growing in 1959 (see GX 468, R. 2748), and there is no reason to doubt that it would have continued until aluminium had superseded copper to the same degree (94.4%) as it previously had in overhead transmission.[25] It is axiomatic that Section 7 demands an assessment of future, as well as present, conditions of competition. *Brown Shoe*, 370 U.S. at 332–333.

---

[25] That same government exhibit (GX 468, R. 2748) which showed that copper accounted for 22.8% of gross additions to insulated overhead distribution lines in 1959 also showed about the same relative use of copper in bare overhead distribution lines (21%). That the replacement of copper by aluminum had progressed to the same point in distribution line use, without regard to whether the line was bare or insulated, demonstrates that the trend to insulated aluminum was proceeding on a time schedule at least as rapid as that of the previous trend to bare aluminum in transmission lines.

In sum, there is only one area—overhead distribution—in which insulated copper conductors are to any appreciable extent "in competition" with insulated aluminum conductors, and even there the competition is rapidly vanishing. Utilizing a high-cost metal, fabricators of insulated copper cable are powerless to eliminate the price disadvantage under which they labor and thus can do little to make their product competitive (R. 224). Indeed, it is doubtful that they even try to be competitive, for, as the district court found, aluminum and copper conductor prices do not respond to one another. So wide is the price differential between the two insulated products that a relatively large increase in the price of aluminum conductor would be necessary before a significant number of customers would shift back to copper.[28] Moreover, the changeover from one metal to the other is a costly operation, involving a variety of collateral expenses and usually entailing a long range, high-level policy decision. This feature may explain why some utility customers, having had no occasion as yet to make substantial additions to their systems, have not yet abandoned copper for aluminum. The same feature makes it clear that even if the existing price differential between the two conductors were unexpectedly eliminated, there would be no significant return to copper.

[28] As of January 1, 1961, the prevailing price of a representative size of polyethlene insulated aluminum weatherproof wire was $73.50 per thousand feet; polyethelene insulated copper of equivalent conductivity cost $115.83. Comparable figures for a representative polyethelene insulated service cable were: aluminum $114.00; copper $206.00 (R. 1228–1229).

Accordingly, the availability of a copper substitute exerts little, if any, restraint upon the power of aluminum cable manufacturers to raise the price of their product.

Whether the separation of submarkets on the basis of price is economically and legally sound depends, of course, upon the competitive significance of the price differential in question. In *Philadelphia National Bank* this Court affirmed the lower court's finding that commercial banking is a line of commerce, despite the fact that in some services (*e.g.*, the making of small loans) banks compete with other institutions. The Court observed that commercial banks enjoy "such cost advantages as to be insulated within a broad range from substitutes furnished by other institutions" (374 U.S. at 356). In *United States* v. *Bethlehem Steel Corp.*, 168 F. Supp. 576, 593 (fn. 35) (S.D. N.Y., 1958) Judge Weinfeld found hot and cold rolled steel sheets to be separate lines of commerce, distinguishing them from each other and from aluminum and copper sheets in part on the basis of price. For "their predominant uses," he found, they "cannot be economically replaced by other products." In *Reynolds Metals Co.* v. *Federal Trade Commission*, 309 F. 2d 223, 229 (C.A.D.C.), the court of appeals affirmed a Trade Commision finding that "florist foil" was a submarket distinct from other aluminum foil since it sold at 65 to 69% of the price of other foil. "Such a difference in price as appears on this record," the court observed, "must effectively preclude comparison, and inclusion in the same market, of products as between which the differ-

ence exists, at least for purposes of inquiry under Sec. 7 of the Clayton Act." And in *United States* v. *Corn Products Refining Co.*, 234 Fed. 964, 976 (S. D.N.Y.), a Sherman Act case, Judge Learned Hand rejected an argument that the defendant, a wet miller of corn, could not be guilty of monopolizing because of competition from dry millers. He said, "[i]f the wet process is cheaper than the dry, then, although a monopoly of the wet will be limited by the dry, it is improper to consider the production of the dry millers when ascertaining the proportion of production controlled by a supposed monopolist of wet milling." See also Kaysen and Turner, *Antitrust Policy* 101–102.

In the present case there can be no doubt but that the price differential between the aluminum and copper products was so substantial and so stable as to preclude effective competition between the two.

Contrary to the district court's belief, *Brown Shoe* is no barrier to this conclusion. There the appellant's contention was that the district court had erred by delineating the relevant submarkets (men's shoes, women's shoes, and children's shoes) too broadly and should instead have subdivided them further on the basis of price and quality differences. It was in response to that contention that this Court made the statement, cited by the court below (R. 1316), that the boundaries of the relevant market must be drawn with sufficient breadth to include all competing products. By this statement, the Court indicated its approval of broad lines of commerce encompassing all reasonably competitive substitutes, but it did not thereby rule out less inclusive submarkets as well.

This is not to say that the Court would have sanctioned further subdivision of the market in *Brown Shoe* itself; on the contrary, it characterized as "unrealistic" Brown's contention "that, for example, men's shoes selling below $8.99 are in a different product market from those selling above $9.00." (*Id.* at 326.) Thus the Court pointed up the lack of realism in any effort to put shoes into different "lines of commerce" where the difference in price might be as little as one cent per pair. In sharp contrast, insulated aluminum wire and cable, used in overhead distribution, is significantly cheaper than its copper equivalent. In most cases, as we have noted, insulated aluminum distribution cable sells at little more than half the price of its copper equivalent. Moreover, the purchaser of shoes selects among available alternatives with an eye not only to price but also to quality, style, and the intangible factor of how much of his income he chooses to spend on shoes; hence, two consumer products may be highly competitive, though disparate in cost. By contrast, a public utility's selection between insulated aluminum and insulated copper cable for use in overhead distribution lines is based almost exclusively on economic considerations (R. 1316), so that any significant difference in price is bound to reduce drastically the degree of competition, as in fact it did here. To put price to one side, as the district court did, is to ignore the single most important practical factor in this business—a result surely not consonant with this Court's decision in *Brown Shoe*.

B. ALUMINUM CONDUCTOR IS A "LINE OF COMMERCE."

The district court's conclusion that aluminum conductor (both bare and insulated) is not a line of commerce was predicated solely on the ground that insulated aluminum conductor, one of its two component submarkets, was not. We submit that aluminum conductor meets the criteria necessary to constitute a line of commerce and should be found to be such independent of any ruling on the insulated aluminum conductor issue."

Plainly it accords with the commercial realities of the electrical industry to combine bare and insulated types of cable in the same line of commerce, since both are used for the same broad purpose of conducting electricity, and both aluminum types are sold to the same customers, the electric utilities. Indeed, the district court so found (Fdg. 31, R. 1289). There remains only the question whether aluminum conductor and copper conductor are separable for the purpose of analyzing the competitive impact of the merger.

The same physical characteristics and cost considerations which differentiate the two insulated product lines also differentiate the broader conductor lines. Aluminum and copper wire and cable are made of metals having entirely different physical and electrical properties and wholly unrelated supply and

" It is improper to assume that the "whole" cannot be a line of commerce merely because the "part" is not. The steel industry, for example, might reasonably be found to constitute an appropriate line of commerce even if some particular steel product were found to be highly competitive, and therefore in the same submarket, with a particular non-steel product.

price patterns (*supra,* pp. 13–15). These factors determine the electrical uses to which the metals can be put. By virtue of their peculiar properties, aluminum and copper conductors have developed distinctive end uses—aluminum, both bare and insulated, as an overhead conductor, and copper as an insulated conductor for underground, indoor and other enclosed wiring, applications in which aluminum's brittleness and larger size render it impractical (*supra,* p. 15). In overhead transmission and distribution, fields in which aluminum is physically interchangeable with copper, the price differential between the two metals dictates the use of aluminum. And, as we have noted, there is no responsiveness between the price of aluminum conductor and that of copper conductor. It is only in a most restricted sense, then, that aluminum and copper compete with one another as electrical conductors. It follows that aluminum conductor, like aluminum insulated, is an appropriate "line of commerce" in which to appraise the effect of the merger on the structure of competition.

II

SINCE ALCOA IS ONE OF THE FEW LEADING FIRMS IN THE HIGHLY CONCENTRATED MARKETS FOR ALUMINUM CONDUCTOR AND INSULATED ALUMINUM CONDUCTOR, ITS ACQUISITION OF A SIGNIFICANT COMPETITOR VIOLATES SECTION 7.

Taking aluminum conductor and insulated aluminum conductor as the appropriate lines of commerce we base our attack upon the merger upon two propositions:

First, Alcoa is a leading firm in markets in which economic power is already highly concentrated.

Second, any acquisition of a significant competitor by one of a few dominant firms in a market in which economic power is already highly concentrated "may tend substantially to lessen competition" within the meaning of Section 7 of the Clayton Act, even though the acquired firm has only a relatively small share of the market.

If these propositions are sound, as we argue below, then Alcoa's acquisition of Rome violated Section 7.

A. ALCOA IS A DOMINANT FIRM IN THE MARKETS FOR ALUMINUM CONDUCTOR AND INSULATED ALUMINUM CONDUCTOR WHERE ECONOMIC POWER IS ALREADY HIGHLY CONCENTRATED

1. There can be no doubt either as to Alcoa's leading position or the highly concentrated character of the relevant product markets. Prior to the end of World War II, Alcoa was the sole producer of primary aluminum and the sole fabricator of aluminum conductor wire and cable. In 1945, the Second Cir-

cuit held that Alcoa had unlawfully monopolized the aluminum industry in violation of Section 7, and refrained from ordering dissolution only because of the possibility that the government's large wartime production facilities might be disposed of in such a way as to create competition. By the disposition of these surplus facilities, and later by granting subsidies (*e.g.*, accelerated tax write-offs and supply contracts) during the Korean emergency, the government made possible the creation and growth of other aluminum producers—Kaiser, Reynolds, Anaconda, and Ormet—which competed with Alcoa and were integrated on a comparable scale. All of these companies rank among the largest industrial corporations in the United States.[28] All of them are active in the fabrication of aluminum conductor, both bare and insulated.

---

[28] The Fortune Directory, *The 500 Largest U.S. Industrial Corporations*, August 1961, shows that in terms of assets and invested capital each of the five (or a parent corporation) was among the Nation's 100 largest, and the rankings in terms of sales, employees and net profits were only slightly lower:

RANK	Assets	Invested Capital
Alcoa	33	57
Anaconda Co.*	22	24
Kaiser	27	22
Reynolds	40	62
Olin Mathieson**	52	81

RANK	Employees	Sales	Net Profits
Alcoa	36	50	56
Olin Mathieson**	52	66	72
Anaconda Co.*	56	70	49
Reynolds	95	108	73
Kaiser	106	177	111

*Anaconda Co. is the parent of Anaconda Aluminum Co., a primary aluminum producer, as well as of Anaconda Wire and Cable Co., which fabricates aluminum conductor.

**Olin Mathieson Chemical Corp. is a half owner of Ormet Inc., an integrated aluminum company.

While Alcoa has lost its monopoly, it remains the largest and strongest competitor both in production of primary aluminum (where it accounted in 1960 for 36% of the nation's output and 38.6% of its capacity) and in the fabrication of aluminum conductor. The remaining power in the conductor markets is largely concentrated in the hands of the other primary aluminum companies. In aluminum conductor, the broader line of commerce, Alcoa led the industry with a pre-merger market share of 27.8%. With its leading integrated competitor (Kaiser), it controlled 50% of the market; with its three leading competitors, more than 76%. Only nine concerns—the five integrated companies [29] plus four independents (including Rome, with 1.3%)—accounted for 95.7% of the output of aluminum conductor. No other company whose statistics appear in the record [30] claimed as much as 1% of the market.

In the narrower market—insulated aluminum conductor—a similar pattern prevailed, except that Alcoa's third ranking share was somewhat lower (11.6%) and Rome's somewhat higher (4.7%). The five integrated companies controlled 65.6% of the

[29] In addition to these five, General Cable—which accounted for 6% of the market—might also be classified as an integrated producer. Thirty percent of its stock is held by American Smelting and Refining Company, and that company also owns 30% of the stock of Revere Copper and Brass Co. American Smelting and Refining also has interlocking directors with both Revere and General Cable, and Revere, in turn, is a full partner with Olin Mathieson in Ormet, a producer of primary aluminum. See GX 396, R. 2620; cf. R. 982, 983–984.

[30] See fn. 14, at p. 20, *supra*.

market and the top four independents (including Rome) whose production statistics are in evidence added another 22.8%. Again, no other firm with statistics of record produced as much as 1%.[31]

In sum, at the time of the merger, the lines of commerce involved were highly concentrated markets dominated by a handful of aluminum companies, but also served by a small and diminishing group of significant independents.

2. The court below did not dispute the underlying data presented by the government, *e.g.*, that five integrated producers controlled more than 80% of the aluminum conductor market. It held, however, that these data were without significance because production of aluminum and fabrication of its products

[31] These figures take on an added significance when compared with figures for other industries which the courts have found to be concentrated. Thus, in *United States* v. *Bethlehem Steel Corp.*, 168 F. Supp. 576, 584, 605 (S.D. N.Y.), Judge Weinfeld found the iron and steel industry "already highly concentrated" when twelve integrated producers possessed 83 percent of the total industry capacity. In *A. G. Spalding & Bros. Inc.* v. *Federal Trade Commission*, 301 F. 2d 585, 612, 617 (C.A. 3), the Third Circuit affirmed the FTC's finding that "there was a high degree of concentration" in the athletic goods industry where the four general line companies accounted for 46.4% of the business and the top nineteen companies accounted for 81.1%. And in *Brown Shoe*, 370 U.S. 294, 300, this Court noted the district court's findings that a small number of shoe manufacturers "occupied a commanding position" in that the top four produced approximately 23% of the nation's shoes.

"were concentrated to the point of monopoly less than twenty years ago" and have "undergone a gradual decentralization by the entry of new producers and fabricators since that time" (R. 1322). This conclusion overlooks completely the fact that it was action by the federal government, not the forces of the market, which broke Alcoa's monopoly and brought about this "decentralization". Prior to the end of World War II Alcoa was the sole producer of primary aluminum and the sole fabricator of aluminum conductor, wire and cable. It would be a remarkable outcome if Alcoa's long history as a monopolist—a status which was judicially terminated only two years before this acquisition—were now deemed a mitigating factor. The establishment of a few new firms as a result of government intervention neither shows that decentralizing forces are at work in the aluminum industry nor disproves the fact that Alcoa is one of a few dominant firms in these highly concentrated markets.

Similarly, the court noted that whereas there were four fabricators of insulated aluminum conductor in 1951, the number had risen to twenty-nine as of April 1, 1961 (R. 1322). This statistic loses significance, however, when it is observed that in 1959, the latest year for which figures are available, only eleven of the twenty-nine companies referred to by this court (AR 5, R. 3229) produced as much as 1% of the insulated aluminum total; five others were, by

the time of trial, out or "almost completely out," of the field; and another five did not make the aluminum conductor products principally used in overhead distribution (*supra*, pp. 20–21). A directory of producers shows only one fabricator in 1961 which was not also listed in 1955, other than those which acquired existing firms (GX–442, R. 2727). The presence of these insignificant concerns cannot reasonably affect the conclusions stated above.

Furthermore, in selecting the years 1951 and 1961 as its points of reference, the district court obtained an extremely misleading picture of the industry trend. If, instead of 1951, it has used 1955 as the earlier coordinate, it would have found a somewhat different, and more meaningful, pattern. Except for Olin Mathieson (which gained entry by buying out Southern Electrical in 1957) and Hatfield Wire and Cable Division of Continental Copper and Steel Industries, Inc. (which accounted for less than .4 percent of insulated aluminum conductors in 1959) GX 436, fn. 1, R. 2718), all of the companies which now occupy the two relevant markets gained entry sometime prior to 1955.

The fact is that there was a sudden surge of new entries into the market in the early days of the Korean War, partly because of shortages of copper and government allocations of aluminum for making aluminum conductor. Of the thirteen concerns important enough to command as much as 1% of either the insulated aluminum or aluminum conductor markets in 1959, one (Alcoa) had been a producer before 1951; four (Kaiser, Reynolds, Olin and Southern Electrical) began to make aluminum conductor in 1951 and seven

(General Cable, Anaconda, Nehring, Essex, Southwire, Central and Rome) had received government allocations and were about to commence production (R. 937–938). The other two, General Electric and Circle, whose market shares are in insulted aluminum, amounted to only 1.5 and 1%, respectively (GX 436, fn. 1, R. 2718). After that early surge a few small companies entered the market but, since 1955, it has gained only one new concern while losing five. These developments neither justify the district court's conclusion that there has been a "gradual decentralization" nor discount the proof that these are highly concentrated markets dominated by a few giant integrated producers.

The same facts dispel the significance of the court's finding that there is "ease of entry" into the industry. The possible entry of new firms is meaningful only if the character of the industry is such that new firms are likely to appear, and to become as important competitors as the firm being eliminated. In this industry, however, most of the newcomers have been able to acquire only inconsequential shares of the market. Indeed, no company which has entered the market (other than by acquisition) since the Korean emergency has obtained a market share approaching that of Rome—the company lost to the market—in either product line. In such circumstances, it would seem that: (1) substantial firms are unlikely to venture into a field which holds such slim prospects of success; and (2) even if they do, they are unlikely to develop to a point where they will be effective substitutes for the firm whose independence has been terminated.

B. ANY ACQUISITION OF A SIGNIFICANT COMPETITOR BY ONE OF THE FEW DOMINANT FIRMS IN A MARKET IN WHICH ECONOMIC POWER IS ALREADY HIGHLY CONCENTRATED MAY SUBSTANTIALLY LESSEN COMPETITION WITHIN THE MEANING OF SECTION 7

This critical proposition, upon which the present case turns, was laid down by this Court in *United States* v. *Philadelphia National Bank*, 374 U.S. 321, 365, n. 42:

> It is no answer that, among the three presently largest firms (First Pennsylvania, PNB, and Girard), there will be no increase in concentration. If this argument were valid, then once a market had become unduly concentrated, further concentration would be legally privileged. On the contrary, if concentration is already great, the importance of preventing even slight increases in concentration and so preserving the possibility of eventual deconcentration is correspondingly great.

We submit that the principle thus noted in the *Philadelphia Bank* case is indispensable to the achievement of the basic purposes of the 1950 amendments to Section 7. The cardinal objective was to halt the rising tide of concentration in the American economy

by preventing accretions of power which "are individually so minute as to make it difficult to use the Sherman Act test against them" (S. Rep. No. 1775; 81st Cong., 2d Sess., p. 5). The House Report noted that "the outstanding characteristic of the merger movement has been that of large corporations buying out small companies, rather than smaller companies combining together in order to compete more effectively with their larger rivals" (H. Rep. No. 1191, 81st Cong., 1st Sess., p. 3). It is difficult to think of a more typical example of these undesirable acquisitions than the giant Alcoa's buying up the small but vigorous Rome Cable Company.

We discuss below in some detail the reasons which commend such a common-sense approach to the issue, but we note first that it is one which offers industrialists and the government manageable standards that can be administered in the statutory terms of probability without endless study of the particularities of every merger with a view to forecasting its individual long-range consequences."

---

[32] See *Crown Zellerbach Corp.* v. *Federal Trade Comm.*, 296 F. 2d 800, 826–827 (C.A. 9); Stigler, *Mergers and Preventive Antitrust Policy*, 104 U. of Pa. L. Rev. 176, 182 (1955); Bok, *Section 7 of the Clayton Act and the Merger of Law and Economics*, 74 Harv. L. Rev. 226, 371 (1960).

1. Such an acquisition may substantially lessen competition because it enhances the power of a concern which has already reached the peril point

On the eve of the acquisition, Alcoa controlled 27.8% of the aluminum conductor market. The acquisition added 1.3%. Both before and after the merger, Alcoa's market percentage was so great as to pose a substantial threat to competition. In the *Philadelphia Bank* case, 374 U.S. 321, 364–365, this Court invalidated a bank merger on the ground, in part, that it "will result in a single bank's controlling at least 30% of the commercial banking business" in the relevant geographical market. While (at p. 364) disclaiming any attempt to specify the smallest market share which would threaten undue concentration, the Court had no doubt "that 30% presents that threat" and cited the views of several economists that even less should suffice to condemn a merger: "Kaysen and Turner * * * suggest that 20% should be the line of prima facie unlawfulness; Stigler suggests that any acquisition by a firm controlling 20% of the market after the merger is presumptively unlawful; Markham mentions 25%" (374 U.S. at p. 364, fn. 41).[23] We submit, therefore, that the present merger—from which Alcoa emerged with 29.1% of the aluminum conductor market—presumptively gave rise to a reasonable probability that competition will be substantially

[23] See Kaysen and Turner, *Antitrust Policy*, p. 133, n. 38 (1959); Stigler, *Mergers and Preventive Antitrust Policy*, 104 U. of Pa. L. Rev. 176, 182 (1955); Markham, *Merger Policy Under the New Section 7: A Six-Year Appraisal*, 43 Va. L. Rev. 489, 521–522 (1957).

lessened. Experience shows that such preponderant economic power nearly always depresses competition.

It is true, as the district court noted, that the market share of the merged companies declined subsequent to the acquisition (R. 1313, 1322, 1324). However, except in the unusual case where "the structure of the market has changed radically since the merger," changes in the merging company's post-acquisition share of the market are entitled to little, if any, significance, since "so long as the merger is the subject of an investigation or proceeding [the merging company] may deliberately refrain from anti-competitive conduct—may sheathe, as it were, the market power conferred by the merger—and build, instead, a record of good behavior to be used in rebuttal in the proceeding." *The Procter & Gamble Company,* Federal Trade Commission Docket No. 6901, decided November 26, 1963, Mimeographed Opinion, p. 38 (Commissioner Elman). Thus, it is not uncommon "for the market share of merging companies to decline for a time after the merger for reasons not related to the ultimate effect of the merger." *Foremost Dairies, Inc.*, Dkt. 6495, CCH Trade Reg. Rep., ¶ 15,877 at p. 20,684. And this Court has pointed out that the sum of the pre-existing shares of the merging companies, while they need not remain stable in the future, nonetheless "provide a graphic picture of the immediate impact of a merger, and, as such, also provide a meaningful base upon which to build conclusions of the probable future effects of the merger." *Brown Shoe Co.* v. *United States,* 370 U.S. 294, 343, n. 70.

2. The competition eliminated by such an acquisition is "substantial" because, in an industry where few firms compete, the competition furnished by each firm has importance beyond its market share.

The most obvious anticompetitive effect of any horizontal acquisition is that it eliminates the competition which would have been offered by the acquired company had it remained independent. The "elimination in whole or in part of the competitive activity of an enterprise which has been a substantial factor in competition" was cited by the House Report on the amended Section 7 as a prime example of effects which the bill would prohibit (H. Rep. No. 1191, 81st Cong., 1st Sess., p. 8). What makes a company a "substantial factor" obviously depends upon a number of considerations, including its absolute and relative size, the vigor with which it competes, the quality of its goods and services, and the degree to which it introduces innovations.

Another highly important consideration—which is decisive here—is the number of effective firms in the industry. In an industry where a great many compete, the loss of a company with a relatively small market share may be of little consequence. On the other hand, in an industry where the number of sellers are few, the competitive significance of each company is correspondingly great and transcends its bare market percentage. This is not to say that in a highly concentrated industry a firm having a small market percentage may not be acquired even by another firm of

the same size. Such an acquisition, by enabling the companies to compete more effectively with their larger rivals, may in some circumstances enhance the prospect of eventual deconcentration and thereby escape the prohibition of the statute. See (*Brown Shoe*, 370 U.S. at 331). But where the loss of one of the few significant competitive factors serves no economic purpose other than to augment the market position of the firm which already leads, its effect upon competition is necessarily adverse and substantial.

It is a basic premise of the antitrust laws that competition will be most vital "when there are many sellers, none of which has any significant market share." *Philadelphia Bank*, 374 U.S. at 363. The more firms there are, the less each firm need fear that its competitive efforts will immediately be nullified by the retaliation or imitation of its rivals. Conversely, the fewer the firms, the greater the likelihood that all of them, by tacit agreement or otherwise, will pursue parallel policies of mutual advantage and refrain from aggressive competition. In a concentrated industry, no less than in a fragmented one, the character of competition may be greatly affected by the number and type of competing entities; the tendency of oligopolists to abstain from competition may be tempered by the presence of their smaller, but still significant, rivals. The more competitors they must reckon with, the less confident they can be that their lead will be followed (*e.g.*, in price increases) or that sluggishness in improving their prod-

ucts will cause no loss of business. Thus the smaller companies may serve as an important stimulus to the market leaders. The fewer small companies there are, the more important each becomes as a check upon the market leaders.

In the present case, the market shares of the acquired company—1.3% in aluminum conductor and 4.7% in insulated aluminum conductor—may not appear great in absolute terms. They loom larger, however, when it is observed that in the aluminum conductor market there were not more than a dozen companies which could account for as much as 1% of industry production in any one of the five years (1955–1959) for which statistics appear in the record. Rome was invariably one of those companies. In 1958, the year preceding the acquisition, Rome ranked ninth among all firms and fourth among the independents (GX 434, R. 2713). In the insulated aluminum field, Rome was an even more significant factor, ranking eighth among all companies and third among the independents (GX 436, R, 2717).[34] Even in quantitative terms, therefore, the competition which Rome offered was, in the context of this industry, substantial.

The role which small companies may play even in a highly concentrated market is also illustrated by the evidence in the present case. Two of the independents—Central and Nehring—engaged, from time to time, in price-cutting (R. 163–164, R. 892). And while Rome apparently was not a price innovator, it was nonetheless shown to be an "aggressive competitor" (R. 937).

---

[34] These rankings do not include Central, whose statistics are not of record. See, *supra*, p. 20, fn. 14.

A pioneer in the field of aluminum insulation, Rome was credited with the development of one of the most widely used insulated conductors. Its broad line of high-quality wire and cable products, its special aptitude and skills in the field of insulation, and its "active and efficient research department and sales organization"—all acknowledged by the court below (R. 1314)—had earned it an outstanding reputation in the industry. A year prior to the merger, it had constructed a $675,000 facility designed to expand its research efforts and stimulate development of new products. The effectiveness of its marketing organization is testified to by the decision of Alcoa to make Rome the vehicle for distributing not only the insulated conductor in which Rome was the acknowledged specialist, but the entire conductor line of both companies (*supra*, pp. 8–10).

It was for these qualitative assets that Alcoa was willing to trade stock worth $34 million. Thus, the president of Rome testified:

> * * * when we talked with the Alcoa people that January, there was more time spent on discussing personnel and organization than there was on balance sheets and figures and things of that nature * * * (R. 955).

Enterprises of such demonstrated quality and high repute cannot easily be replaced by new entrants to the market, and their elimination is plainly a substantial loss to competition.

The presence of independents such as Rome, even in a market dominated by giants, is desirable also as part of the "economic way of life sought to be

preserved by Congress" (*Brown Shoe*, 370 U.S. at 333). By limiting the further growth of oligopoly, Congress hoped to "aid in preserving small business as an important competitive factor in the American economy" (S. Rep. No. 1775, 81st Cong., 2d Sess., p. 3). There is no reason to believe that this policy or the views of Congress respecting the "desirability of retaining 'local control' over industry and the protection of small businesses" (*Brown Shoe*, 370 U.S. at 315–316), were intended not to apply to small firms operating within the framework of an oligopolistic industry. And Rome, while a substantial competitive factor, was at the same time the prototype of the relatively small, locally controlled business which Congress aimed to preserve.

3. The competition eliminated by such an acquisition is "substantial" because, in such an industry, independent competitors offer the best hope for future decentralization of economic power

The aggressiveness and innovation of small concerns are important not only as a competitive check upon the dominant leaders in a concentrated market but also because their presence preserves the possibility of eventual deconcentration. If the leaders can buy up small competitors before they have an opportunity to grow, justifying the purchase on the ground that the statistical change in market shares is quantitatively small, then it is easy to perpetuate oligopoly and preclude any possibility of the restoration of greater competition. The importance of this element

was emphasized by the Court in the *Philadelphia Bank case*, 374 U. S. 321, 365, n. 42 (quoted p. 55, *supra*). It furnishes a strong additional reason for barring all such acquisitions by a dominant firm.

4. The competition eliminated by such an acquisition is "substantial" because, in such an industry, each such acquisition is a major step towards the elimination of all independent concerns and the capture of the whole market by the giant companies

The paramount purpose of the amended Section 7 was to prevent the piecemeal growth of oligopoly by an accumulation of individually small acquisitions. Congress feared that

> Where several large enterprises are extending their power by successive small acquisitions, the cumulative effect of their purchases may be to convert an industry from one of intense competition among many enterprises to one in which three or four large concerns produce the entire supply (S. Rep. No. 1175, 81st Cong., 2d Sess. 5, quoted in *Brown Shoe*, 370 U.S. at 333–334; and see H.R. No. 1191, 81st Cong., 1st Sess. 8).

In *Brown Shoe*, this Court gave effect to the congressional policy against creeping concentration by striking down a merger in the retail shoe industry, a highly fragmented line of commerce composed of 70,000 retail outlets of which 22,000 were "shoe stores" in the ordinary sense (370 U.S. at 300). Although the combined market share of the acquired and acquiring companies did not exceed 5%, and the effect of the acquisition was to give the acquiring company

control over only 7.2% of the nation's retail "shoe stores" (*id.*, at 343, 345), the Court held that to approve the merger might require it to approve comparable acquisitions by Brown's competitors seeking similar market shares (pp. 343–344), thus permitting this fragmented market to become, little by little, an oligopoly.

If, in a highly dispersed industry, a small acquisition is banned by the statute on the ground that it might constitute a step on the road to oligopoly, a comparable or more substantial acquisition by a leading company in an industry which is much further along that road plainly stands on no better footing. Indeed, the more nearly an industry approaches all-out oligopoly, the more objectionable each step becomes and the more urgent it is that the policies of the Clayton Act be brought into play. In such an industry it should not be necessary to demonstrate a pronounced merger "trend"—*i.e.*, a past history of acquisitions or a deliberate merger policy on the part of the leading companies—in order to justify immediate action to head off further acquisitions. For by the time such a trend is established, it is likely that all of the acquirable companies of more than marginal significance will have been removed from the market. In the present case, for example, one further acquisition by four of the six integrated aluminum companies now in the conductor field (see, *infra*, p. 68) could eliminate virtually all of the significant independents. And if Alcoa is permitted to acquire a vigorous competitor

such as Rome for the purpose of preserving its "No. 1" position (*supra,* p. 29), it is difficult to see how Kaiser or Reynolds could be barred from purchasing comparable independents (Essex, Southwire or Nehring) in order to protect their relative positions or to overtake Alcoa. Within a relatively short time, all of the significant independents would be extinguished and the market occupied exclusively by integrated giants.

Moreover, in an oligopolistic industry there is an inherent likelihood that an expansionary move by any of the few dominant firms will induce a defensive or retaliatory counteraction by its principal competitors. That very process is unfolding in the aluminum conductor fields. The absorption of Rome by Alcoa was one of five acquisitions by producers of primary aluminum since 1957. In that year Olin Mathieson acquired the Southern Electrical Corporation, then the largest independent manufacturer of aluminum conductor (GX 434, R. 2713); and Kaiser acquired the Bristol, Rhode Island, plant of the U.S. Rubber Company, one of the top ten in the insulated aluminum field. These moves, and the threat they were thought to pose, were specifically identified as factors influencing Alcoa's 1959 decision to acquire Rome (GX 150, R. 2127; GX 161, R. 2179–2184). And it was partly in response to the three prior acquisitions, that Reynolds, in 1961, acquired the wire and cable facilities of John A. Roebling's Sons Division of the Colorado Fuel and Iron Company, a small fabricator

(GX 387, R. 2606; GX 396, R. 2620). Finally, in February 1963, too late to be noted in the record below, Aluminium Ltd., of Canada announced the acquisition of Central Cable Corporation, one of the largest of the independents (see p. 20, *supra*, fn. 14). As a result of this series of mergers, there now remain only four non-integrated fabricators of aluminum conductor whose individual shares of total industry production (based on 1959 figures, the latest in the record) amounted to more than one percent (Southwire, Essex, General Cable, and Nehring). And since Harvey Aluminum Company, another primary producer, is presently considering entry into the conductor field through the acquisition of an existing manufacturer (R. 474), it seems likely that the ranks of the independents will soon be further depleted, if the decision below is allowed to stand.

For the integrated aluminum companies, therefore, acquisition has apparently become a preferred method by which to enter the aluminum conductor markets and, once having entered, to expand and diversify their operations. We do not wish to overdraw the picture. Two of the acquisitions (Olin-Mathieson—Southern Electrical and Aluminium, Ltd.—Central Cable) resulted in the replacement of the acquired company by an integrated company which had not previously been active in the conductor field. The court found, moreover, that two of the other acquisitions (Kaiser-Bristol and Reynolds-Roebling) involved small market shares (.8% and .1%, respectively) and that in both cases there was a decline in

the post acquisition market shares of the acquired and acquiring companies. On the basis of these facts, the court concluded that there was "no significant pattern or trend of mergers with respect to the manufacture and sale of aluminum conductor, wire and cable products." (Fdg. 46, R. 1293).

While we concede the underlying facts, we dispute the conclusion which the court below drew from them—a legal and economic conclusion which this Court is free to reject. In the first place, the significance of this series of acquisitions does not lie in short-run increases in the market shares of the particular acquiring companies, or even of integrated companies generally, but in the fact that each combination (except Reynolds-Roebling) removed from the market one of the few substantial non-integrated competitors. In an industry such as this, if five acquisitions within a three-year period—eliminating nearly half of the substantial non-integrated fabricators—does not constitute a "significant pattern or trend," it is difficult to see how such a trend could be established short of the extinction of all the independents.

Second, even where the acquiring company merely replaces an existing independent fabricator, potential competition may be foreclosed. For if the merger device had been unavailable, the acquiring company might in any event have entered the conductor field by means of internal expansion, the "socially preferable" means of corporate growth. *United States* v.

Philadelphia National Bank, 374 U.S. 321, 370.[34] There can be no doubt but that these enormous enterprises possess the financial resources to undertake such expansion and that the electrical conductor field is one to which they would naturally gravitate. The record shows that Alcoa, feeling its supremacy threatened by the Kaiser-Bristol merger, was prepared to embark upon a large program of internal expansion in

---

[34] Compare the statement of the district court that "[e]xpansion from within rather than by acquisition may be preferable from the economist's point of view but the statute makes no such prohibition" (R. 1330).

One of the unfortunate consequences of mergers such as the one here is that they deny to the consuming public, and to the national economy, the benefits of the investment in new plant and equipment which the acquiring company might otherwise make. In discussing the Rome merger, an Alcoa official stated that:

"The acquisition by any of the integrated producers of any of the independent wire and cable companies or various combinations of mergers are not nearly as obnoxious to the people who are already active in the wire and cable industry as is the entrance of a newcomer with bright, shiny new equipment. Acquisitions and mergers have the common denominator of not adding to existing capacity in the industry, and everybody in the industry is very conscious of the fact that the entire industry would be much more healthy if each manufacturer were to toss about two-thirds of his equipment into the Atlantic Ocean" (GX 162, R. 2185).

But a response to new and expanding industrial demands by the production of "bright, shiny, new equipment" is an obvious requisite of a growing economy. One function of antitrust legislation in general, and Section 7 in particular, is to encourage new productive capacity even when the members of the industry would be most happy to restrict existing capacity.

the event its merger efforts failed (GX 168, 169, R. 2193–2195), and had already completed plans to build new insulating facilities of its own in place of those formerly supplied by Rome under the tolling arrangement (*supra*, p. 27). Similarly, Reynolds, drawn to the aluminum conductor market by the presence there of its two principal rivals, gave consideration to the possibility of expanding its own facilities before deciding instead to acquire Roebling (GX 387, R. 2606). By the same token, it is entirely likely that Olin-Mathieson (or Aluminium, Ltd.), confronted by a situation in which its three major competitors were leading fabricators in the aluminum conductor field, would have felt pressure to develop its own fabricating capability had the merger avenue been closed. In sum, the entry of these two large primary producers into the aluminum conductor market need not have been gained at the expense of the substantial competition which Southern Electrical and Central Cable would have continued to provide as independents.

In view of the sequence of acquisitions since 1957, there is reason to apprehend that the remaining independents will eventually be absorbed and the market occupied exclusively by the integrated giants. The policy considerations which prompted the enactment of Section 7 demand that this transformation of the market into an even more intensive oligopoly be halted at its incipiency.

CONCLUSION

The judgment of the district court should be reversed, and the cause should be remanded with directions that the court enter a judgment of divestiture.

Respectfully submitted.

INDEX

	Page
Questions Presented	1
Appellees' Counterstatement	3
1. The Background of the Acquisition	4
(a) Alcoa's Declining Market Position	4
(b) Alcoa's Market Disadvantage	7
(c) The Contrast Between Alcoa and Rome	11
2. Copper and Aluminum in the Wire and Cable Industry	14
3. The Proceedings in District Court	19
Summary of Argument	21
Argument	26
I. The District Court Correctly Rejected Insulated Aluminum Conductor and Aluminum Conductor as "Lines of Commerce"	27
A. The District Court Properly Rejected Insulated Aluminum Conductor as a Line of Commerce	27
(1) The District Court Properly Applied the Pragmatic Test Established in Brown Shoe	28
(2) The Government's Single-Factor Test Is Inconsistent With Brown Shoe and Would Exclude Critical Elements from the Relevant "Area of Effective Competition"	30
(a) Submarket Boundaries Are Determined by the Existence of Substitution at Either the Product or Production Levels	30
(b) The District Court's Finding That Insulating Fabricators Move Freely Between Copper and Aluminum Insulated Products Is Controlling on the Line of Commerce Issue	34

Page

(3) There Is Substantial Competition Between Copper and Aluminum Insulated Products 38

(a) Copper and Aluminum Are Substantially Competitive in the Overhead Distribution Field 39

(b) It Has Not Been Shown That Copper-Aluminum Competition in the Insulated Field Will Disappear 43

B. The District Court Properly Rejected Aluminum Conductor as a Line of Commerce 46

II. The Government Has Failed to Show the Required Anticompetitive Effect in Either of the Alleged Aluminum Conductor Lines of Commerce 48

A. Anticompetitive Effect Has Not Been Shown With Respect to Insulated Aluminum Conductor 52

(1) Alcoa Was Not And Is Not The "Largest Producer" of Insulated Aluminum Conductor 52

(2) Insulated Aluminum Conductor Is Not "Highly Concentrated" or "Oligopolistic" 53

(a) Concentration Percentages Are Not A Reliable Measure of the Structure or Competitiveness of a Market 54

(b) There Is Unparalleled Ease of Entry 57

(i) Existing Firms Do Not Have Any Absolute Cost Advantage 58

(ii) There Is No Product Differentiation In Insulated Aluminum Conductor 59

(iii) Economies of Large Scale Do Not Inhibit Entry 61

(iv) Uncertainty as to Market Conditions Does Not Impede Entry .. 62

(v) The Effectiveness of Easy Entry Is Not Impaired by Entry Lag .. 62

Page

(c) Easy Entry Assures Vigorous Competition Among Existing Firms 63

(d) Market Performance Demonstrates the Effectiveness of Competition in Insulated Aluminum Conductor 65

(i) There Is Active Price Competition 65

(ii) There Have Been Significant Shifts in Market Shares 67

(iii) There Has Been Significant Entry 67

(3) The Acquisition of Rome Will Not Affect Market Structure or the Vigor of Competition in the Manufacture and Sale of Insulated Aluminum Products 70

(a) The Acquisition of Rome Did Not and Will Not Change Pre-existing Market Structure 70

(b) Rome Was Even Less Important Than Its Small Market Share Would Indicate 72

B. The Required Anticompetitive Effect Has Not Been Shown With Respect to the Alleged Aluminum Conductor Line of Commerce 75

(1) The Lack of Anticompetitive Effect as to Each Component Demonstrates the Absence of Such Effect as to the Alleged Composite Line 75

(2) The Market Percentages on Which the Government Relies Are Devoid of Economic Significance 76

C. Market and Historical Factors Found by the Court Affirmatively Establish That Anticompetitive Effect Has Not Been Shown 78

(1) There Has Not Been, and Will Not Be, Any Adverse Effect on Competitors 79

Page

(2) Alcoa's Purpose Was to Obtain Insulating Capability, Not to Expand Its Aluminum Conductor Facilities 79

(3) There Is No Significant Merger Trend 80

(4) There Has Not Been, and Will Not Be, Any Adverse Effect on Consumers 83

Conclusion 84

Appendix 85

v.

ALUMINUM COMPANY OF AMERICA and
ROME CABLE CORPORATION

On Appeal from the United States District Court for the Northern District of New York

---

BRIEF FOR APPELLEES

QUESTIONS PRESENTED

The Government's statement of the Questions Presented is argumentative and misleading.

First. The Government's characterization of the competitive effect issue as "primary" and the line of commerce question as only "subsidiary" is presumptuous and unwarranted. Both are equally important in a Section 7 case; as this Court has said, "[d]eter-

mination of the relevant market is a necessary predicate to a finding of a violation of the Clayton Act . . . Substantiality can be determined only in terms of the market affected.'"[1] The district court, relying on extensive industry testimony and supporting documentation, found that the Government had not sustained its burden of proof on line of commerce. The Government's task on appeal cannot be lessened by calling this crucial threshold question "subsidiary."

Second. The Government's statement of the alleged "primary question" distorts and obscures the facts pertaining to this acquisition. While Aluminum Company of America (Alcoa) is the largest producer of aluminum conductor wire and cable, it is such solely by virtue of its leading, though steadily declining, position in the manufacture of *bare* aluminum wire and cable.[2] Rome Cable Corporation (Rome) was primarily (more than 90 per cent) a manufacturer of copper products. Far from being a "significant" fabricator of bare aluminum conductor, it was *de minimis*, with a .3 per cent market share, and the Government does not appeal from the district court's conclusion that the required anticompetitive effect was not shown with respect to bare aluminum conductor. With regard to insulated aluminum wire and cable,

---

[1] *United States* v. *E.I. duPont de Nemours & Co.*, 353 U.S. 586, 593 (1957); quoted in *Brown Shoe Co.* v. *United States*, 370 U.S. 294, 324 (1962).

[2] It should also be noted that the fact that Alcoa may be the largest producer of primary aluminum is not germane to the issues raised by this appeal. The Government's claim that this acquisition may substantially lessen competition in the sale of aluminum ingot used in the production of wire and cable was rejected by the district court (Concl. 7, R. 1303), and no appeal has been taken from that ruling.

Alcoa was not the "largest producer" but ranked third, with 11.6 per cent in 1958. Rome, with 4.7 per cent, ranked eighth or ninth. In short, in the bare field, where Alcoa was "largest," Rome was not "significant"; in the insulated field, where Rome was not *de minimis*, Alcoa was not "largest." Finally, the Government's assumption that this acquisition occurred in "an already oligopolistic market" is contrary to the court's finding that there is vigorous competition in the sale of aluminum wire and cable products (Fdg. 62, R. 1295).

More objectively stated, the questions presented are these:

1. Whether the district court erred in finding that (a) insulated aluminum wire and cable and (b) aluminum conductor wire and cable were not proper lines of commerce within the meaning of Section 7 of the Clayton Act.

2. Whether the district court erred in finding that the Government had failed to prove that Alcoa's acquisition of the assets of Rome may substantially lessen competition or tend to create a monopoly in the manufacture and sale of either (a) insulated aluminum wire and cable, or (b) aluminum conductor wire and cable, assuming each to have been established as a proper line of commerce.

APPELLEES' COUNTERSTATEMENT[3]

This is a direct appeal from the judgment of the district court holding that Alcoa's acquisition of Rome did not violate Section 7 of the Clayton Act (15 U.S.C.

[3] Where appropriate, assertions in the Government's Statement that we believe to be inaccurate or misleading will be dealt with in the Argument rather than in this Counterstatement.

18). The Government does not challenge the district court's findings of fact as "clearly erroneous" (Rule 52(a) F.R. Civ. P.), but urges that its ultimate findings on the line of commerce and competitive effect issues involve an erroneous interpretation of the statute. The appeal is limited to two alleged aluminum conductor lines of commerce: (1) insulated aluminum conductor, and (2) aluminum conductor, which is a composite of bare and insulated aluminum conductor products.

1. THE BACKGROUND OF THE ACQUISITION

The district court found that this acquisition was undertaken by Alcoa "in the face of its declining market" (Opin., R. 1333), for the purpose of obtaining insulating know-how and diversification needed "to overcome a market disadvantage . . ." (Opin., R. 1321). It described the acquisition as "the combination of an aluminum and an essentially copper manufacturing company" (Opin., R. 1333), and found that Alcoa and Rome had competed in the sale of only three aluminum conductor products (Opin., R. 1314), that "there was not substantial or significant competition between [them] in the sale" of these products (Fdg. 52, R. 1294), and that Rome's manufacture of aluminum products "did not induce [the] acquisition" (Fdg. 7, R. 1284). These facts, not challenged by the Government, provide the background for the acquisition.

(a) Alcoa's Declining Market Position

Alcoa's pre-World War II monopoly, Judge Hand's landmark decision,[4] and the Government's post-war policies that fostered competition in the aluminum business, all are acknowledged historical facts. But

[4] *United States* v. *Aluminum Company of America*, 148 F. 2d 416 (2d Cir. 1945).

the Alcoa monopoly ended nearly a quarter of a century ago. Since then, Kaiser and Reynolds have "removed all reasonable doubts as to their capacity to effectively compete with Alcoa . . .,"[5] three additional primary producers—Ormet, Inc. (Ormet), Harvey Aluminum (Harvey), and Anaconda Aluminum Company (Anaconda)—have entered the field, and Aloca's position has shrunk significantly. In short, the Alcoa of the 1960's is not the Alcoa of 25 years ago.

In terms of percentage of primary aluminum production, the court found that Alcoa had "declined sharply" and with reasonable consistency, from 52 per cent of domestic output in 1948, to 45 per cent by 1956, and, by an additional 9 percentage points, to 36 per cent in 1960 (Opin., R. 1312-13).[6] In addition, there are substantial quantities of foreign aluminum, including Canadian production, which "in 1960 amounted to more than 1.5 billion pounds, or more than 35 per cent of total U.S. primary aluminum production" (Fdg. 64, R. 1295; Opin., R. 1312). Alcoa's post-war decline is also reflected in the drop in its return on invested capital, which fell from 9.3 per cent in 1950 to 3.7 per cent in 1961 (Opin., R. 1321; R. 1066).[7]

---

[5] *United States* v. *Aluminum Company of America*, 153 F. Supp. 132, 171 (S.D.N.Y. 1957). If the Government's gratuitous statement that Alcoa made its first attempt to acquire Rome twelve days after this decision (Govt. Br., p. 3, n. 1) is intended as a statement of cause and effect, it is wholly without support in the record.

[6] The court found a substantially similar decline with respect to capacity (Opin., R. 1313).

[7] Comparable declines were experienced in Alcoa's return on gross revenue, which declined from 9.7 per cent in 1950 to 5 per cent in 1961, and in its return on shareholders' equity, which declined from 13.7 per cent in 1950 to 5.6 per cent in 1961 (R. 1065-66).

Alcoa has suffered at least equally substantial declines in aluminum wire and cable. It pioneered the use of aluminum as a substitute for copper in the electrical wire and cable field, and sold substantially all of the bare aluminum cable used for electrical transmission in the United States prior to World War II (Opin., R. 1313). While Alcoa is still the number one producer of bare ACSR and aluminum cable,[8] it now faces competition from 10 or 11 other suppliers and "its relative participation in the [bare aluminum conductor] market has declined materially" (Opin., R. 1313, 1323). This decline was "reasonably consistent" beginning in 1954, the first year for which data are available, "and continuing since the acquisition" (Opin., R. 1313). Thus, Alcoa's percentage declined from 48.4 per cent in 1954, to 32.5 per cent in 1958, and, combined with Rome, to 26.1 per cent in 1961, more than 6 percentage points less than Alcoa alone in 1958 (*Ibid.*). Overall, the 7-year period from 1954 to 1961 saw the Alcoa percentage fall by more than 45 per cent.

On the basis of these downward trends in Alcoa's market position and rate of return, and the increase in number and size of its competitors, the district court found that Alcoa did not occupy a dominant position in either primary aluminum or aluminum wire and cable (Opin., R. 1326-27).

---

[8] ACSR consists of a high tensile strength steel core, surrounded by hard drawn aluminum wires. Aluminum cable, bare, is generally similar to ACSR but does not have the high tensile strength steel core. Both products are sold for use by electric utility companies in the overhead transmission and distribution of electric power and energy (R. 630-36; AR 12, R. 3246; AR 13-13a, R. 3247-48; AR 14-14a, R. 3249-50).

(b) Alcoa's Market Disadvantage

Alcoa's pioneering role, its continued—though steadily declining—leadership, and the research activities, "outstanding" technical service, and line of accessory and complementary products referred to by the Government (Govt. Br., pp. 6-7), all pertain exclusively to *bare* aluminum conductor products. Alcoa has never even approached a position of leadership with respect to *insulated* products.

As recently as 1952, Alcoa was totally without insulating capability and thus was "in an unfavorable market position" to meet the increase in demand for covered or insulated aluminum products (Opin., R. 1313; R. 1077-78). As a partial solution, it entered into a tolling arrangement under which Rome made two comparatively simple products, aluminum covered line wire and multiplex cable,[9] for Alcoa's account (R. 1078, GX 28, R. 1536-37). Selling exclusively products insulated for it by Rome, Alcoa, in 1955, accounted for 10.8 per cent of insulated aluminum shipments, ranking third behind Kaiser, with 26.5 per cent,

---

[9] Covered line wire (also referred to as weatherproof) consists of a conductor (copper or aluminum) covered with a synthetic rubber (neoprene), thermoplastic (polyethylene), or fibrous covering. It is used in the distribution of electric power and energy in primary and secondary overhead lines and in service drops from the utility pole to a building (See R. 636-40; AR 12, R. 3246; AR 14-14a, R. 3249-50; AR 15-15a, R. 3251-52; AR 25, R. 3267-81; AR 26, R. 3282-3304).

Multiplex cable consists of one, two or three insulated conductors (copper or aluminum) twisted around an uninsulated conductor which acts as a neutral and also provides mechanical support. It is used as a self-supporting secondary distribution line and as a service drop from the utility pole to a building (See R. 636-40; AR 12, R. 3246; AR 14-14a, R. 3249-50; AR 15-15a, R. 3251-52; AR 27, R. 3305-21; AR 28, R. 3322-43).

and Anaconda, with 18.2 per cent (Gx 436, R. 2717). Its percentage remained at about this level until the acquisition.

Alcoa's interest in acquiring Rome did not arise from a desire to increase its capability or capacity for the manufacture of aluminum covered line wire and multiplex cable (R. 1083-1123). In 1956, it had begun to make its own polyethylene covered line wire and multiplex (Gx 146, R. 2097-98), and by the time of the acquisition, although it had not yet installed neoprene facilities, Alcoa was in a position to satisfy its requirements of polyethylene and neoprene covered line wire and multiplex (R. 1122-23). It, however, still "lacked the 'know-how' to manufacture the more complicated types of insulated wire and cable" (Opin., R. 1321) and, therefore, as the Government concedes, "could not offer customers a full line of its own insulated products, both aluminum and copper, as could certain of its competitors" (Juris. State. 9-10).

Alcoa attributed its sharp decline in bare aluminum, in part, to its inability to supply a full line of insulated products including copper products. Many of the companies which had entered the bare aluminum cable field had broad wire and cable experience, e.g., Anaconda, General Cable, Essex, Southwire, Nehring and Central, and thus, were "in the more healthy position, being able to produce both bare aluminum and the insulated copper" (R. 1055-56; R. 1080). Kaiser's acquisition of the Bristol plant of United States Rubber created another "dual roler," i.e., a company with the capability of producing both bare aluminum and insulated copper products (R. 1081; Gx 161, R. 2179). It was Alcoa's need for comparable product diversity, not "Rome's manufacture of aluminum products," that

induced the acquisition (Fdg. 7; R. 1284; Opin., R. 1321).

Alcoa first approached Rome in October 1957, offering Alcoa stock valued at about $24 million (R. 951-52; Gx 165, R. 2190). When this was rejected, Alcoa sought advice from Ebasco Services, Inc., a management consulting and engineering firm with special competence in the utility field (R. 1103-04). Ebasco confirmed the correctness of Alcoa's decision to diversify its line of electrical conductors (R. 1060), advised Alcoa against trying to establish its own insulating division (R. 1104-05), and made approaches on Alcoa's behalf to six companies (R. 1106), none of which was more than a *de minimis* producer of aluminum conductor products (R. 1087-88).

When it looked as if a suitable acquisition could not be made, Alcoa began to consider what would be involved in developing it own insulating organization (R. 1088-89, 1061; Gx 168, R. 2194). A preliminary study indicated that a "rounded out program" covering a reasonably broad range of insulated products would require a minimum of $35 to $40 million and would take at least 5 to 10 years (R. 1089-90, 1124-26, 1064). Alcoa's sales vice-president testified that he would not have approved this expenditure (R. 1090; see R. 1064), and the court found that the "time required . . . and the expense involved seemed to foreclose" Alcoa's obtaining insulating competence from within (Opin. R. 1321).[10]

---

[10] The Government's Statement implies that Alcoa, prior to acquiring Rome, had definitely decided to go forward on its own (Govt. Br., pp. 28-29). This is not supported by the record, and is contrary to the findings. The President's letter, relied on by the Government (Gx 168, R. 2194), as well as his testimony at the

It was against this background that Alcoa reopened negotiations with Rome (R. 1061-62, 1091), and, on March 31, 1959, acquired the assets of Rome in exchange for 355,226 shares of Alcoa stock, with a market value of approximately $34 million (Gx 7, R. 1345; Gx 9, R. 1427; R. 1102). "Alcoa's purpose," the court found,

> was to acquire the ability to manufacture the more complicated insulated wire and cable products and diversify its operations. Rome's manufacture of aluminum products did not induce said acquisition. (Fdg. 7, R. 1284).

In short, its objective was "to overcome a market disadvantage rather than to obtain a captive market . . . or to eliminate a competitor" (Opin., R. 1321).[11]

---

trial (R. 1061), make clear that he had a twofold purpose in asking for study of internal expansion: first, to enable Alcoa better to evaluate any offer it might want to make in the future, and, second, to develop for the first time the picture as to "what we are headed into if we are going on our own . . ." Nor is it correct to say that Alcoa had "worked out plans for a new plant . . ." (Govt. Br., p. 29). "It was a very preliminary look, possibly as a place to start from, with a more detailed study" (R. 1126). At the time of the acquisition, Alcoa had no "definite plans to expand its aluminum wire and cable production" (Fdg. 67, R. 1296).

[11] The Government's Brief may leave the impression that Alcoa has acquired other producers of aluminum conductor in addition to Rome, or that it was deterred from making additional acquisitions by the pendency of this litigation. (Govt. Br., pp. 7-8). The court found, however, that "aluminum wire and cable products were not involved" in Alcoa's other acquisitions (Opin., R. 1322), and that the Rome acquisition was not shown to have been "part of a continuing program contemplating future expansion through mergers or acquisitions in wire and cable . . ." (Fdg. 11, R. 1284). Having acquired insulating know-how, Alcoa had no interest in buying it twice (R. 1109-11).

(c) The Contrast Between Alcoa and Rome

As would be expected in the case of a diversification acquisition, Alcoa and Rome had essentially different interests and capabilities in the wire and cable business.

Rome's corporate history, assets and sales are set forth with reasonable accuracy in the Government Brief (p. 8).[12] The Government, however, fails to make clear that "Rome was primarily the manufacturer of copper products . . ." (Opin., R. 1314), and substantially overstates the importance of aluminum in its pre-acquisition operations.

The Government states that Rome enjoyed an excellent reputation "because of its broad range of high quality aluminum and copper conductor and accessory products, its high degree of technical skill, and its substantial achievements in research and development" (Govt. Br., pp. 8-9). The implication that aluminum and copper products were of the same or comparable importance to Rome is contrary to the court's finding that "copper was by far the predominant metal used by Rome in its wire and cable operations," accounting for more than 90 per cent of its combined copper and aluminum purchases and for from 90.3 per cent to almost 94 per cent of its total wire and cable sales revenue (Fdg. 18, R. 1286; Fdg. 68, R. 1296).

It is also misleading to imply that Rome had a "broad range" or "diversified line" of insulated alumi-

[12] The Government's Statement, however, could be read as indicating that Rome had three wire and cable plants. In fact, all of Rome's wire and cable products were manufactured in Rome, New York; the Collegeville, Pennsylvania, and Torrance, California, plants produced only cable accessory and conduit products, respectively (Fdg. 16, R. 1285), products not included in the lines of commerce involved in this appeal.

num products, and that its technical skill and research achievements pertained thereto. Aluminum has gained acceptance principally in overhead distribution products, such as weatherproof line wire and multiplex cable[13] (Fdg. 29, R. 1289). These products are among the "simplest" of all insulated wire and cable products (Fdg. 84, R. 1299; Fdg. 55, R. 1294), and even Alcoa, with its limited experience and insulating capability, possessed sufficient "technical skill" to make them (R. 1122-24). The fact is that Rome's "diversified line" consisted overwhelmingly of products chiefly made from copper, including complex, multiconductor cables, such as those shown in AR 18, R. 3257-58; and it is to these more sophisticated copper products that Rome's admitted technical skill and research facilities apply.[14]

Especially glaring is the Government's statement that Rome was noted "for its outstanding research activities and technical know-how, *particularly in the field of insulated aluminum conductors*" (Govt. Br., p. 10, emphasis added). Each record reference cited in support of this proposition clearly refers to Rome's insulating ability in general; nowhere in the record is there support for the notion that Rome possessed special insulating know-how with respect to aluminum conductors.[15] Rome's insulating competence may be

---

[13] Weatherproof and service drop accounted for 91.1 per cent of Rome's total shipments of insulated or covered aluminum wire and cable in 1959 (Gx 443, R. 2728).

[14] These products unlike weatherproof and multiplex, require the use of varied and sophisticated insulations and protective coverings (R. 651-53; AR 21-24, R. 3263-66), a wide variety of testing equipment and techniques, and engineering and research capability for the design of cables and customer service (R. 658-60).

[15] Significantly, the service drop cable cited as an example of Rome's development work in the insulated conductor field was originally developed as a copper product (R. 936).

used on either copper or aluminum. In fact, however, Rome's "relatively full line of insulated wire and cable products [was] chiefly made from copper" (Fdg. 78, R. 1299).

In contrast to Rome, Alcoa made no copper conductor products and lacked the know-how to make the more complicated insulated constructions that were Rome's forté (Fdg. 78, R. 1299; Opin., R. 1313, 1321). Moreover, where Rome specialized in insulated products, the court found that "bare wire and cable products constituted the great preponderance of Alcoa's sales," amounting to "more than 90 per cent" of its total conductor wire and cable shipments in 1958 (Fdg. 14, R. 1285).

Because of their fundamentally different interests and capabilities, the court found that the two companies were not substantially competitive with respect to either bare aluminum conductor products, Alcoa's chief area of interest, or in the sale of insulated products, chiefly copper, which were Rome's specialty (Fdg. 52, R. 1294; Fdg. 78, R. 1299). With respect to bare aluminum cable, Alcoa, in 1958, had shipments amounting to $23 million, and accounted for 32.5 per cent of total shipments (Fdg. 21, R. 1286; Fdg. 45, R. 1292). Rome's sales of bare aluminum wire and cable in that year amounted to $240,000, which was approximately 1 per cent of its total wire and cable sales and only .3 per cent of total shipments (*ibid.*).

In the insulated field, Alcoa's 1958 shipments of aluminum weatherproof and multiplex cable were valued at $4.2 million and represented 11.6 per cent of total shipments of insulated or covered aluminum conductor (*ibid.*). Rome's sales of insulated or covered

aluminum products in the same year amounted to $2.2 million and represented 4.7 per cent of total shipments of insulated or covered aluminum conductor (AR 52, R. 3405; Fdg. 45, R. 1292).[16] As a percentage of total 1958 insulated wire and cable shipments, both copper and aluminum, Alcoa's market share was .3 per cent and Rome's 1.3 per cent (Fdg. 76, R. 1298). Sales of insulated aluminum products represented less than .6 per cent of Alcoa's, and approximately 5 per cent of Rome's total 1958 sales (Gx 16, R. 1484; Gx 22, R. 1496).

2. COPPER AND ALUMINUM IN THE WIRE AND CABLE INDUSTRY

Differences in the physical and electrical properties of copper and aluminum influence their use in the wire and cable industry. The court found, however, that such differences do not establish, and that the industry, itself, does not recognize, separate economic entities confined to insulated aluminum conductor or a combination of bare and insulated aluminum products (Opin., R. 1316; Fdgs. 25-29, R. 1288-89; Add'l. Fdg. 4, R. 1336-37). Thus, the Government's reference to "the aluminum conductor industry" presupposes a separate identity which the district court rejected (Govt. Br., pp. 11, 18).

The most significant differences between copper and aluminum are that aluminum has only about 62 per cent the conductivity, and is only about 1/3 the weight, of copper. This means that pound-for-pound aluminum will provide more conductivity than copper, mak-

[16] Rome's sales of aluminum weatherproof and multiplex cable, the only insulated products also sold by Alcoa, amounted to $1.7 million. It made the same products out of copper in the amount of $2 million (AR 56, R. 3406).

ing it appreciably cheaper as a conductor metal (R. 182; Gx 50, R. 1650). At the same time, because an aluminum cable of conductivity equal to copper must be larger in cross-sectional area, this economic advantage begins to disappear as one moves from bare conductor to insulated cables, "the more so as insulations and coverings become thicker and more complex" (Gx 50, R. 1650; R. 216). Moreover, in some situations, even where the cost of insulated or covered aluminum conductor is cheaper than copper, the final installed cost may be greater owing to other economic factors, such as the higher cost of connectors used with aluminum (Gx 50, R. 1650; AR 76, R. 3472).

In the bare cable field, the industry recognizes important distinctions between copper and aluminum. Bare aluminum is not only cheaper than copper, but its physical and electrical properties give it positive technical advantages.[17] For these reasons, bare aluminum has virtually displaced copper (except in seacoast areas) in overhead transmission (Fdg. 24, R. 1288). Moreover, the industry differentiates between bare copper and bare aluminum, manufacturers reporting them to the Bureau of the Census under separate product classifications (Fdg. 24, R. 1288; R. 947).[18] Finally, the manufacture and sale of bare aluminum cable require special stranding equipment, and the engineering skill needed to design long-span, high

[17] For example, aluminum's lighter weight permits the erection of fewer supporting structures and the larger size required to achieve equal conductivity with copper reduces corona loss (R. 161-62).

[18] Products Codes 33571 and 33521 "Aluminum and aluminum-base alloy wire and cable (including ACSR)"; Product Code 33572, "Copper and copper-base alloy wire (including strand and cable, bare and tinned, for electrical transmission)."

voltage transmission lines (Fdg. 24, R. 1288; R. 663, 697-98). For all of these reasons, appellees agreed, and the court found, that bare aluminum cable and ACSR might properly be considered a separate line of commerce (Fdg. 24, R. 1288). The court, however, found no anticompetitive effect in that line, and the Government has not challenged this conclusion on appeal (Concl. 7, R. 1303; Govt. Br. p. 38).

The insulated products which comprise most of the Government's alleged insulated aluminum line of commerce are only two of many produced by the wire and cable industry. This industry "is characterized by vigorous competition" and includes more than 200 companies, among them "many strong, well-financed and highly reputable concerns" (Fdg. 81, R. 1299). In 1958, the industry produced insulated products valued at $1.3 billion, of which copper conductor products accounted for more than 95 per cent (Fdg. 29, R. 1289).

Insulated aluminum wire and cable, unlike bare, is not recognized by the industry "as a separate economic entity" (Opin., R. 1316). Insulated products are identified and defined by the industry, and reported to Census, in accordance with their function or type, "not according to the metal used as conductor" (Fdg. 25, R. 1288),[19] and manufacturers regard themselves simply as "insulators of wire and cable products, not as insulators of copper wire and cable on the one hand, or of aluminum wire and cable on the other"

[19] For example, authoritative technical manuals (AR 25-28, R. 3267-3343), Rome product bulletins (AR 30-32, R. 3345-60), and the Wire Buyers' Guide, official publication of The Wire Association (AR 73, R. 3439), all define and classify insulated wire and cable products according to their function or type, e.g., building wire, power cable, covered line wire, self-supporting service drop cable, rather than by the metal employed as conductor.

(Fdg. 26, R. 1288). As this implies, and as the court found, there is complete manufacturing interchangeability between copper and aluminum (Fdgs. 27, 55, 56, R. 1289, 1294-95; Opin., R. 1316).[20] In addition, wire and cable insulators have flexibility in the products they can make, and a company able to make more complicated products, such as building wire, power cable, control cable, etc., "can readily" make line wire and multiplex cable, "using either copper or aluminum conductors, with its existing machinery and personnel" (Fdg. 55, R. 1294; Fdg. 84, R. 1299). Such interchangeability among products and conductor metals is of practical competitive importance, for the court found that manufacturers "constantly review their product lines and switch readily from one product or conductor metal to another in accordance with market conditions" (Fdg. 56, R. 1294-95; Fdg. 85, R. 1300).

The larger size aluminum wire required to achieve equal current carrying capacity with copper, tends to make aluminum economically unacceptable in more sophisticated heavily insulated constructions and in applications where space is important (R. 216; Gx 50, 1650). In overhead distribution lines, where cable size is not a limiting factor, the use of aluminum has increased appreciably since about 1950. With the acceptance of aluminum as a copper substitute, the number of manufacturers making insulated aluminum products increased from 4 to 29, "most of the new

[20] The only change required from a manufacturing standpoint is the use of different lubricants and a clean-up of the equipment if both copper and aluminum are used on the same drawing machine. It is customary to draw copper and aluminum in separate cycles of production, or, where volume permits, to use one machine on copper and another on aluminum (Fdg. 27, R. 1288; e.g., R. 73-74, 251, 280, 379-80, 661, 982-83).

entrants [coming] from the ranks of insulated copper conductor producers . . ." (Opin., R. 1323).

Contrary to the Government's contention, aluminum has not "virtually displaced," and is not in the process of "rapidly displacing," copper in insulated or covered overhead distribution lines (Govt. Br., p. 12). This contention will be dealt with more fully in the Argument (*infra*, pp. 38-45), but it should be noted that the district court found that copper and aluminum are functionally interchangeable in these applications; that buyers consider other economic factors that may offset the lower cost of aluminum cable (Fdg. 28, R. 1289; Opin., R. 1316); that in areas where aluminum has gained "increasing use," there is a "lively competition between aluminum and copper products" (Opin., R. 1312); that the copper-aluminum price difference, and the lack of price sensitivity between them, do not foreclose "actual competition" (Opin., R. 1316); and that, in fact, "substantial quantities" of the copper versions of overhead distribution products are sold (Fdg. 29, R. 1289).[21]

In its Statement, the Government has a section captioned "The structure of the industry," in which it sets forth market share statistics, alleges that a pattern of concentration prevails, and refers to competitive difficulties allegedly experienced by nonintegrated fabricators (Govt. Br., pp. 18-24). We dispute both that there is an "industry" and that numerical data as to market shares and concentration can adequately describe the "structure" of a market; however, to avoid undue repetition, we shall defer discussion of

[21] In dollar terms, 1953 sales of copper weatherproof and service drop amounted to more than $15 million (R. 319-22).

the Government's concentration contentions until the Argument portion of this Brief (*infra*, pp. 53-70).

As to the alleged competitive difficulties of independent fabricators, it should be noted that the district court found that this acquisition "will not bring about, enhance or aggravate any so-called 'price squeeze' . . ." (Fdg. 66, R. 1296); that "no shortage in primary aluminum is foreseeable" (Opin., R. 1312); and that independent manufacturers testified that "in the three years since the acquisition, there had been no adverse effect," and that none foresaw any future adverse effect (Fdg. 50, R. 1294). The abandonment of insulted aluminum products by certain nonintegrated companies, the court attributed to "the existence of a vigorous competition in the products involved" (Opin., R. 1330). In fact, during the post-acquisition period, other nonintegrated companies substantially increased their sales of aluminum conductor products, and expanded, or planned to expand, their capacity for producing such products (R. 75-76, 228, 381, 404-06, 984-85, 990).

3. THE PROCEEDINGS IN DISTRICT COURT

On February 5, 1962, after approximately 22 months of extensive pre-trial discovery, the four-week trial of this action commenced. At the trial, the court received more than 500 documentary exhibits and heard and observed more than 50 witnesses, among them engineers and purchasing agents for public utilities, experienced wire and cable technical, sales and managerial personnel, and appellees' executive officers chiefly responsible for the acquisition and operation of Rome.

On January 28, 1963, the court filed its Opinion and Findings of Fact and Conclusions of Law and dis-

missed the Complaint. With respect to the two alleged lines of commerce involved in this appeal—aluminum conductor and insulated aluminum conductor—the court held (1) that they were not proper lines of commerce, and (2) even assuming that they were proper lines, the prohibited anticompetitive effect had not been shown.

The court's line of commerce determinations were based on the findings as to industry understanding and practice, manufacturing interchangeability, and copper-aluminum competitiveness which have been reviewed above (pp. 14-18). In concluding that the Government failed to prove the prohibited effect on competition, the court refused to condemn the acquisition solely on the basis of market share statistics, since such data not only showed Rome's shares to be comparatively small but demonstrated continuous and substantial declines in Alcoa's pre-acquisition market share and in the Alcoa-Rome combined share after the acquisition (Opin., R. 1324, 1329; Fdg. 45, R. 1292-93). The nonstatistical evidence established, *inter alia*, that Alcoa's purpose was to overcome the market disadvantage resulting from its lack of insulating capability (Opin., R. 1321, 1333; Fdg. 7, R. 1284); that there had not been substantial or vigorous competition between Alcoa and Rome (Opin. R. 1329; Fdg. 52, R. 1294); that there is complete and demonstrated ease of entry (Opin., R. 1323; Fdgs. 54-58; R. 1294-95); that neither competitors nor purchasers have been, or expect to be, adversely affected in any way by the acquisition (Opin., R. 1326, 1330; Fdgs. 59-66, R. 1295-96); and that there has been and continues to be vigorous competition in the manufacture and sale of aluminum wire and cable products (Opin., R. 1330; Fdg. 69, R. 1297).

SUMMARY OF ARGUMENT

The district court found that the Government failed to sustain its burden of proof on either line of commerce or competitive effect. Accordingly, this appeal must fail if the district court can be sustained as to either necessary element of a Section 7 case.

I

The district court ruled that the Government failed to prove (A) that insulated aluminum wire and cable products comprise a line of commerce separate from their copper counterparts; and (B) that a meaningful line of commerce can be created by adding together noncompetitive bare and insulated aluminum conductor products. These determinations are challenged solely as a matter of law, the court's underlying findings of fact being undisputed.

A. (1) Applying the practical indicia set forth in *Brown Shoe Company* v. *United States,* 370 U.S. 294 (1962), the district court found that the industry does not differentiate between copper and aluminum insulated products, that copper and aluminum products are functionally interchangeable, and that there are no unique production facilities, distinct customers or specialized vendors for insulated aluminum conductor products. Though recognizing that the prices of copper and aluminum insulated products are "generally distinct" and not sensitive to each other, the court found that this did not foreclose "actual competition." Accordingly, making a practical judgment based on the great preponderance of the submarket indicia, it concluded that insulated aluminum conductor had not been established as a proper line of commerce.

(2) The Government argues that the district court should have based its line of commerce determination solely on aluminum's price advantage in two simple insulated products. This one-sided approach to market definition ignores entirely the district court's undisputed finding that insulating fabricators can and do "switch readily" from copper to aluminum conductor products in accordance with market conditions. The importance of such interchangeability as a determinant of market boundaries is firmly established in economic theory and is reflected in the supply-oriented submarket indicia—unique production facilities, distinct customers and specialized vendors—endorsed by this Court in *Brown Shoe*. Here, the absence of "distinct customers" and the court's undisputed findings as to industry practice establish that it would have been unrealistic to confine the relevant "area of effective competition" to the relatively small portion of total insulating capacity (less than 5 per cent) that at the time of trial happened to be allocated to aluminum.

(3) Reinforcing and confirming the court's line of commerce determination, though not essential to it, are its findings that "substantial quantities" of insulated copper products are sold in "active," "lively," and "actual" competition with their aluminum counterparts. Seeking to minimize these findings, the Government argues that such competition will ultimately disappear. The record, however, does not support this contention, and, indeed, the Government did not even request such a finding in its Proposed Findings and Brief submitted to the district court.

B. The alleged aluminum conductor line of commerce is the mathematical sum of bare and insulated aluminum conductor shipments. If the insulated com-

ponent is not, itself, a proper line, then the composite, too, must fall, since, as to the insulated segment, important competitive elements are excluded. In any event, this grouping of noncompetitive bare and insulated products is not recognized in the industry as a separate economic entity or submarket, and appears to be simply a numerical trick calculated to give this acquisition an appearance of substantiality. Such appearance is deceiving for the composite line consists predominantly of Alcoa's bare aluminum conductor shipments. Rome was *de minimis* with respect to such products, and no appeal has been taken from the district court's ruling that no anticompetitive effect was shown with respect to bare aluminum conductor.

II

Prior to the acquisition, the only products sold by both Alcoa and Rome to more than a *de minimis* extent were two simple insulated aluminum conductor products, and as to these, competition between them was found not to be substantial. The district court found that market share and concentration statistics, standing alone, did not condemn the merger, and, relying on numerous economic and historical factors, concluded that the Government had not sustained its burden of proof on the competitive effect issue.

Though not disputing the court's findings of fact, the Government argues that the acquisition violates Section 7 because Alcoa, "the industry leader in an already oligopolistic product market," has acquired a "significant" competitor. This theory has no relation to the facts of this case.

A. (1) With respect to insulated aluminum conductor, Alcoa was far from the "industry leader," rank-

ing third, more than 60 percent behind the first ranking supplier, and lacking insulating capability and product diversity possessed by many of its competitors.

(2) The Government's glib assumption that insulatel aluminum conductor is an "oligopolistic" market rests entirely on market share and concentration percentages. It is, however, common ground among economists that such simple numerical and statistical measures cannot afford the "firm understanding of the structure of the relevant market" that is required in Section 7 cases. *United States* v. *Philadelphia, Bank,* 374 U.S. 321, 362 (1963). Concentration percentages are particularly meaningless where, as here, the alleged "market" is so narrowly drawn. But even where the market may be properly delimited, its structure is not determined by simple statistical measures. Rather, a coordinated examination of important market structure variables, such as condition of entry and product differentiation, and the actual record of market performance over a period of time, is required. Here, such an examination confirms the court's finding that the alleged insulated aluminum conductor "market" is characterized by active and vigorous competition. Thus, the Government's assumption that the acquistion occurred in an already "oligopolistic" market cannot be sustained.

(3) The Rome acquisition will not affect market structure or impair the vigorous competition in insulated aluminum conductor. There are numerous strong and capable firms which are either already making insulated aluminum conductor products or are "waiting in the wings." Rome, itself, was even less important in the so-called insulated aluminum "market" than its small market share would indicate. It adhered to a

"policy of not going below the prices of its competitors" and had declined significantly in market percentage from 1955 to 1958.

B. (1) As noted, the alleged aluminum conductor line is simply a mathematical composite of bare and insulated aluminum conductor products. The Government concedes that this acquistion does not have the prohibited effect with respect to bare aluminum conductor products. Since such effect cannot be shown as to the insulated component, it follows that the Government has also failed in its burden of proof as to the composite line.

(2) The only purpose of the composite aluminum conductor line is to show a market percentage of the magnitude deemed significant by this Court in *Philadelphia Bank*. In this case, however, such percentage has no competitive significance whatever since it primarily reflects Alcoa's pre-acquisition position in bare aluminum conductor. The small portion contributed by Rome, 1.3 per cent, consisted predominantly of insulated aluminum conductor which is not even claimed to be competitive with bare. Moreover, this percentage is actually just a point on a steady, downward curve reflecting the continuing erosion of Alcoa's position as a supplier of bare aluminum wire and cable, a decline that began long before the acquisition and has continued thereafter.

C. Where, as here, market share statistics are not conclusive, determination of the competitive effect issue requires "an examination of various economic and historical factors . . ." *Brown Shoe*, 370 U.S. at 329. Here, such factors, to a degree unprecedented in Section 7 cases, affirmatively establish that this acquisition will not have the prohibited anticompetitive effect.

Especially important are the following: The unparalleled ease of entry; the absence of product differentiation; the substantial market share declines experienced by Alcoa before, and by Alcoa-Rome after, the acquisition; the fact that Rome was not an aggressive price competitor; the absence of substantial competition between Alcoa and Rome; the fact that competing manufacturers have not been and will not be adversely affected by the acquistion; the post-acquisition expansion of nonintegrated competitors; the uncontradicted testimony of utility purchasers formerly buying from both Rome and Alcoa that this acquisition had not had, and will not have, any adverse effect; the fact that it was Alcoa's objective to acquire insulating capability and diversification rather than to expand its aluminum conductor facilities; the absence of a history of mergers on the part of Alcoa or a significant merger trend in the alleged industry as a whole; and the continued vigor of competition.

ARGUMENT

This appeal challenges the district court's application of amended Section 7 to two alleged aluminum conductor lines of commerce. Since the court found that the Government had failed to sustain its burden of proof on both the line of commerce and competitive effect issues, the appeal must fail if the district court can be upheld as to either issue. In Part I, we will show that the district court's line of commerce determinations comport fully with standards established by this Court in *Brown Shoe Co.* v. *United States*, 370 U.S. 294 (1962), and other cases. In Part II, we will show that the district court correctly applied Section 7 in finding that the Government had not proved the required anticompetitive effect.

I.

THE DISTRICT COURT CORRECTLY REJECTED INSULATED ALUMINUM CONDUCTOR AND ALUMINUM CONDUCTOR AS "LINES OF COMMERCE"

In district court, both parties agreed that conductor wire and cable, corresponding to the wire and cable industry,[22] and insulated wire and cable (copper and aluminum), corresponding to the insulating subindustry, were proper lines of commerce (Fdgs. 31, 33, R. 1289-90). Appellees opposed, and the court rejected, the Government's attempts to further divide the insulating subindustry into an insulated aluminum subsubmarket, and to establish a composite aluminum conductor line consisting of bare and insulated aluminum products (Fdgs. 23, 25-29, R. 1288-89; Opin. R. 1316-17). We shall take up first the Government's alleged insulated aluminum conductor line since the court's findings with respect thereto are pertinent to the composite aluminum conductor line.

A. The District Court Properly Rejected Insulted Aluminum Conductor as a Line of Commerce

The district court has found that insulated products made from aluminum do not comprise a product market, or submarket, separate and distinct from their copper counterparts. The Government does not challenge the court's underlying findings of fact, but claims that it erred in failing to give controlling weight to the price differential between copper and aluminum insulated products (Govt. Br., pp. 39, 46). The Gov-

[22] Industry No. 3357 of the Standard Industrial Classification is entitled "drawing and insulating of nonferrous wire" and includes establishments which manufacture either bare or insulated products, using either copper or aluminum as the conductor metal (AR 74, R. 3451, 3460).

ernment's single-factor approach to market definition is inconsistent with this Court's *Brown Shoe* decision; in this industrial context, excludes critical elements from the relevant "area of effective competition"; and disregards the court's findings that the copper-aluminum price difference does not foreclose "lively," "active," and "actual" competition between copper and aluminum insulated products (Opin., R. 1312, 1316).

(1) The District Court Properly Applied the Pragmatic Test Established in Brown Shoe

In *Brown Shoe,* this Court held that there are broad product markets within which there may be "well-defined" and "economically significant" submarkets. 370 U.S. at 325. It did not attempt to formulate any rigid standard for determining submarket boundaries, but indicated that a broad-ranging, pragmatic evaluation of market realities was required. Courts were admonished to examine (*ibid.*)

> such practical indicia as industry or public recognition of the submarket as a separate economic entity, the product's peculiar characteristics and uses, unique production facilities, distinct customers, distinct prices, sensitivity to price changes, and specialized vendors.

The district court, relying on industry testimony and supporting documentation, concluded that the Government had not sustained its burden of proof since the alleged insulated aluminum line does not satisfy the great preponderance of the listed indicia. Insulated aluminum "is not recognized in the industry as a separate economic entity" (Opin., R. 1316; Fdgs. 25, 26, R. 1288); insulated wire and cable products are desig-

nated by their function or type, e.g., weatherproof, multiplex, building wire, control cable, etc., whether made from copper or aluminum, and product classifications used by the Bureau of the Census conform to this practice[23] (Fdg. 25, R. 1288; R. 946); copper and aluminum insulated products "are completely interchangeable from a performance standpoint" (Fdg. 28, R. 1289; Opin., R. 1316); both are made interchangeably on the same equipment and with the same personnel (Fdg. 27, R. 1288; Fdg. 56, R. 1295); the same customers, i.e., utility companies, purchase copper and aluminum insulated products (Opin., R. 1316; Fdg. 28, R. 1289); and there are no "specialized vendors" of insulated aluminum wire and cable (Opin., R. 1316; Fdg. 26, R. 1288). Though recognizing that copper and aluminum wire and cable prices are "generally distinct" and not sensitive to each other, the court found that this did not foreclose "actual competition" between aluminum products and their copper counterparts (Opin., R. 1316).

Thus, the court's conclusion that insulated aluminum conductor is not a self-contained "area of effective competition" rests on a pragmatic examination of market realities. The Government's contention that it should have disregarded all but the two indicia that seemed to favor its position is, we submit, wholly at variance with the balanced appraisal called for by *Brown Shoe*. Moreover, because of the nature of competition in the insulating business, the indicia prin-

---

[23] While not necessarily controlling on the line of commerce question, the census classifications are not without significance. See *Crown Zellerbach Corp.* v. *Federal Trade Commission*, 296 F. 2d 800, 813 (9th Cir. 1961), cert. denied 370 U.S. 937 (1962).

cipally relied on by the district court have special and compelling importance in this case.

(2) The Government's Single-Factor Test Is Inconsistent with Brown Shoe and Would Exclude Critical Elements from the Relevant "Area of Effective Competition"

As noted, the Government urges that the court should have determined the line of commerce issue solely on the basis of the copper-aluminum price difference. Though conceding that copper and aluminum insulated products are competitive, it claims that they are "sufficiently noncompetitive to be treated as distinct submarkets" (Govt. Br., p. 40). The implicit assumption in this argument is that the only valid criteria for determining the "area of effective competition" in Section 7 cases are the "distinct prices" and "sensitivity to price changes" indicia. This approach to market definition is not only incompatible with *Brown Shoe* but, in this case, would lead to an artificial and unrealistic line of commerce.

(a) *Submarket Boundaries Are Determined by the Existence of Substitution at Either the Product or Production Levels*

Where the issue is whether products of different industries, made in wholly different manufacturing establishments, must be joined in a single product market, the distinct prices and price sensitivity indicia will be largely determinative. On the other hand, where, as in both *Brown Shoe* and this case, the issue is whether products of the same industry, made in the same plants and on the same equipment, should be broken down into separate product markets, other criteria—e.g., industry recognition, unique production facilities, distinct customers, specialized vendors—be-

come of critical importance.[24] This is recognized by economists as well as by this Court's *Brown Shoe* opinion.

Economists specializing in problems of competition and monopoly emphasize that a market must be defined in light of *either* product or supply substitution. Professor Stigler, in the introduction to a series of essays concerning business concentration, formulates this as follows:

> An industry should embrace the maximum geographical area and the maximum variety of productive activities in which there is strong long-run substitution. If buyers can shift on a large scale from product or area B to A, then the two should be combined. If producers can shift on a large scale from B to A, again they should be combined.
>
> Economists usually state this in an alternative form: All products or enterprises with large long-run cross-elasticities of either supply or demand should be combined into a single industry.[25]

Professor Kaysen makes the same point:

> To delimit the market in terms of products requires examination of both the chain of potential substitutes at various prices as seen by buyers and the widening circle of potential rival suppliers at various prices as seen by sellers.[26]

---

[24] The Government, itself, stressed the importance of interchangeability of productive facilities in *United States* v. *Brown Shoe Company*, 179 F. Supp. 721, 729 (E.D. Mo. 1959), where it urged the court to adopt lines of commerce including different types and grades of shoes on the ground that "the same machinery is used to produce shoes of different types and grades and . . . production is often converted between types and grades."

[25] *Business Concentration and Price Policy* 4 (1955).

[26] *Business Concentration and Price Policy* 117.

The Government's line of commerce argument is, of course, diametrically opposed to the economists' concept of a product market.

In *Brown Shoe*, as in *duPont-General Motors*, this Court made clear that a line of commerce is not just one or two reasonably homogeneous products. Rather, it is a "relevant market" or "area of effective competition," with reference to which "substantiality" can rationally be determined.[27] With specific reference to a submarket, this Court has emphasized that in order to qualify as a line of commerce, it must be "well-defined" and "economically significant," and should be recognized as a "separate economic entity," not simply as a separate product.

Moreover, the "practical indicia" to be considered in determining submarket boundaries, though referring to short-run rather than long-run substitutability,[28] express in practical terms the basic economic concept that markets are to be defined in terms of close substitution of either product or production facilities.[29] Indeed, these indicia are most meaningfully applied when broken down into demand (product) and supply (production) indicia. This can be illustrated by two examples: (1) If products A and B have no peculiar characteristics and uses and have similar and mutually sensitive prices, there will be substantial and rapid product substitution, and both must be placed in

---

[27] *United States* v. *E.I. duPont de Nemours & Co.*, 353 U.S. 586, 593 (1957); *Brown Shoe Co.* v. *United States*, 370 U.S. 294, 324 (1962).

[28] The distinction between broad markets and submarkets having antitrust significance might well be expressed in terms of the difference between long-run and short-run substitutability.

[29] Compare Stigler, *op. cit.*, at 4-5.

the same submarket. (2) Where no manufacturing specialization or unique production facilities are required, and the same vendors sell products A and B to the same customers, there will be substantial and rapid supply (or production) substitution, and, again, A and B must be placed in the same market.

The rationale for such a bilateral approach to market definition is that where either type of substitution exists, market power cannot be measured by reference to A alone, for suppliers of A face effective competition from product B, itself, in example (1), and from production facilities used on B, but readily applicable to A, in example (2). In either case, the existence of effective substitution prevents the achievement or exercise of market power.[30]

The "distinct customers" indicium is important to this argument, for the technical ability to shift productive facilities from one product to another may be rendered competitively meaningless if "continuing relationships between buyers and sellers . . . make such shifts unlikely." *United States* v. *Bethlehem Steel Corp.*, 168 F. Supp. 576, 592 (S.D.N.Y. 1958).[31] Here,

[30] The term "area of effective competition" which this Court uses synonymously with "'relevant market" or "line of commerce" derived from *Transamerica Corp.* v. *The Board of Governors*, 206 F. 2d 163, 169 (3d Cir. 1953), where Judge Maris stated that "the area or areas of effective competition in which monopoly power might be exercised" must be determined before an acquisition's competitive effect can be ascertained. Quoted in *United States* v. *E. I. duPont de Nemours & Co.*, 353 U.S. 586, 593 (1957).

[31] The close relationship between the "distinct customers" indicium and supply substitution as a determinant of market boundaries is noted in Bock, *Mergers and Markets*, An Economic Analysis of Case Law 30 (1960), which was cited by this Court in *Brown Shoe*, 370 U.S. at 325, n. 43.

in contrast to *Bethlehem Steel*, there are no "distinct customers" for copper and aluminum insulated products, and manufacturers "switch readily from one product or conductor metal to another in accordance with market conditions" (Fdg. 56, R. 1295).

We respectfully submit, therefore, that in appropriate cases, productive capacity devoted to products A and B must be combined in a single submarket, whether or not A and B are closely competitive in use.[32] This conclusion, not only comports with economic analysis but gives meaning to the supply-oriented indicia —unique production facilities, distinct customers, specialized vendors—which would be nullified by the Government's one-sided approach.

(b) *The District Court's Finding That Insulating Fabricators Move Freely Between Copper and Aluminum Insulated Products is Controlling on the Line of Commerce Issue*

As noted, we do not suggest that the mere theoretical possibility that productive capacity may be shifted from one product to another requires that all products that can be made interchangeably must necessarily fall within the same submarket. Here, however, the court has found that it is the regular practice in the industry for wire and cable insulators to shift from one conductor metal to another.

The court's findings depict a single insulating entity consisting of producers who regard themselves simply as insulators, "not as insulators of copper wire and cable on the one hand or of aluminum wire and cable

[32] Here, of course, as will be argued below, there is also substantial competition at the product level (*infra*, pp. 38-45).

on the other" (Fdg. 26, R. 1288). Such insulating fabricators move freely from one product and one conductor metal to another and, in a continuing, dynamic process, re-evaluate their product lines and consider how their insulating capacity should be allocated among copper and aluminum products[33] (Fdgs. 56, 85, R. 1294-95, 1300). Since there are neither "specialized vendors" nor "distinct customers" for insulated aluminum conductor products, the court found that insulators presently using only copper would also make aluminum products "if profitable orders were obtained" (Fdg. 56, R. 1295).

The Government's oversimplified line of commerce argument wholly ignores the dynamics of competition in the insulating business. Its error is clearly revealed in the following excerpts from its Brief (Govt. Br., p. 43):

> Utilizing a high-cost metal, fabricators of insulated copper cable are powerless to eliminate the price disadvantage under which they labor and thus can do little to make their product competitive (R. 224).
>
> * * *
>
> [T]he availability of a copper substitute exerts little, if any, restraint upon the power of aluminum cable manufacturers to raise the price of their product (Govt. Br., p. 44).

First of all, it is fallacious to refer to "fabricators of insulated copper cable" and "aluminum cable

---

[33] This process is especially significant in this case since products where aluminum is principally used are among the simplest of all insulated products, and the shift to such products, in either copper or aluminum, can readily be made by the numerous manufacturers already making more sophisticated products (Fdgs. 55, 84, R. 1294, 1299).

manufacturers" as if these were two separate and static entities (Fdgs. 26, 56, R. 1288, 1295).[34] Indeed, the very witness relied on by the Government testified that his company makes insulated products, using either copper or aluminum; that the amount made with each metal depends on "what the customer wants"; and that both copper and aluminum products are made interchangeably on the same equipment (R. 223, 228-29). And, as another Government witness testified, he began to make aluminum conductor products "as soon as the first customer asked us, about 1950" (R. 73; see also e.g., R. 946, 982).

Thus, it is obvious that if a fabricator should feel himself at a competitive disadvantage owing to the use of copper, he is not "powerless," for he can readily use aluminum. Since he will still be making the same product on the same machinery and with the same personnel, and will still be selling to the same utility customers for the same end use, it would have been unrealistic for the district court to hold that merely by changing raw material, a fabricator shifts from one line of commerce to another.

The competitive importance of the dynamic factors that the Government ignores is strikingly illustrated by recent events. In the early 1950's, as the Government acknowledges, an increase in copper prices made aluminum conductor products more popular. (Govt.

---

[34] With the exception of the three primary aluminum producers, all but one of the 29 companies listed by the Business and Defense Services Administration (BDSA) as manufacturers of aluminum insulated products (AR 5, R. 3211) were also listed by that agency in 1958 as producers of insulated copper wire and cable (AR 71, R. 3425). Significantly, each of the three primary aluminum producers, Alcoa, Kaiser and Reynolds, is now also bi-metallic since the insulating companies they acquired are listed as manufacturers of insulated copper wire and cable (*ibid.*).

Br., pp. 24-25). Only four companies were then making insulated aluminum products. The increased demand for aluminum, however, generated "a sudden surge of new entries" (Govt. Br., p. 54), virtually all of which came from existing insulating companies which previously had used only copper (Opin., R. 1323).[35] Thus, (1) the so-called copper fabricators were not "powerless" to compete, and (2) the availability of insulating capacity, theretofore, used solely on copper, exerted profound restraint upon the "aluminum cable manufacturers' " power to achieve any sort of market advantage.

More recently, insulated aluminum prices have declined (R. 1228-29; see also R. 243, 399), and insulators have had little economic incentive to move in that direction. The court's findings make clear, however, that if aluminum cable prices were to rise above a competitive level, insulating capacity presently used on copper would be allocated to aluminum. Among the companies to do so would be such substantial insulating firms as Anaconda, General Cable, Essex, Southwire, General Electric, Circle, etc., which already are devoting a relatively small portion of their total capacity to aluminum.[37] Other companies, e.g., Phelps

---

[35] The record is clear that this did not involve "entry" in the normal sense of that word. Rather, manufacturers already in existence simply used some of their existing machinery and personnel to make aluminum as well as copper conductor products (e.g., R. 73, 242, 250-51, 280, 735-36, 942-43, 985-86).

[37] Precise figures as to the comparative importance of aluminum and copper for each of the companies presently using both are not available. However, the court's findings as to the limited role of aluminum in the insulating business overall (Fdg. 29, R. 1289) and evidence relating to Rome (AR 52, R. 3405), Essex (R. 231-34) and General Cable (R. 996-97), clearly indicate that aluminum presently occupies only a small portion of an insulator's total capacity.

Dodge, Kennecott, Simplex, Triangle, would do likewise, for, as the court found, manufacturers not presently making insulated aluminum conductor products consider whether to do so, and would make such products if it could be done profitably (Fdg. 56, R. 1294-95; see, e.g., R. 250-51, 280). It is no answer that not all of the more than 200 insulating companies presently make the simple products chiefly used in overhead distribution lines,[38] for companies able to make more complicated products can readily make the simpler ones, such as line wire and multiplex cable (Fdg. 55, R. 1294; Fdgs. 84, 85, R. 1299-1300).

For all of the reasons just discussed, "substantiality" cannot be determined in terms of a "market" restricted to the manufacture and sale of insulated aluminum products. This conclusion, which we believe is compelled by the court's findings as to industry recognition and production substitution, is reinforced by the competition found to exist between copper and aluminum insulated products.

(3) There Is Substantial Competition Between Copper and Aluminum Insulated Products

The Government does not dispute the district court's findings that the copper and aluminum versions of insulated products are "completely interchangeable from a performance standpoint" (Fdg. 28, R. 1289; Govt. Br., p. 41), and that they are sold in "actual competi-

[38] While the Government claims that only 21 companies produced "the aluminum or copper insulated conductors principally used in overhead lines" (Govt. Br., p. 21), the Wire Buyers' Guide, official publication of the Wire Association lists approximately 45 manufacturers of weatherproof line wire (AR 73, R. 3439). In accordance with the usual industry practice, it does not differentiate between copper and aluminum.

tion" with each other (Opin., R. 1316). It contends, however, that because of the "substantial" and "stable" price differences, copper-aluminum competition in overhead distribution products is not effective and, in any event, is "rapidly vanishing" (Govt. Br., pp. 43, 45). These contentions are contrary to the findings and the evidence.

(a) *Copper and Aluminum Are Substantially Competitive In The Overhead Distribution Field*

In *Brown Shoe,* where, as here, the lines of commerce found by the court satisfied a preponderance of the submarket indicia, this Court ruled that price differences between medium and low-priced shoes were not decisive, pointing out that "it would be unrealistic to accept Brown's contention that, for example, men's shoes selling below $8.99 are in a different product market from those selling above $9.00" 370 U.S. at 326. The Government seeks to distinguish this case on the ground that the price differential between copper and aluminum insulated products is so great as to foreclose the possibility of only a 1¢ difference as in *Brown Shoe* (Govt. Br., p. 46). In fact, however, competition between copper and aluminum insulated products in overhead distribution is, if anything, closer than between low and medium-priced shoes.

In terms of the current price of the wire or cable, itself, aluminum weatherproof line wire and multiplex cable are cheaper than their copper counterparts. This advantage, however, is not necessarily determinative, for when all economic factors are taken into account, the net advantage of aluminum in terms of final installed cost is reduced, and may disappear (Fdg. 28, R. 1289; *supra,* p. 15). Thus, for example, Consoli-

dated Edison has determined that copper was more economical than aluminum in its overhead primary and secondary distribution mains in New York City, reversing a previous decision in favor of aluminum (AR 76, R. 3472; R. 712).[39] One of the reasons copper prevailed was that Consolidated Edison, being interested in relatively short extensions to an existing system, required frequent connections. Admittedly, this may not be "exactly typical of national conditions," but, in varying degree, other utilities serving congested areas encounter comparable conditions (R. 713).

Other utilities, too, scrutinize carefully the over-all economics of copper versus aluminum in overhead distribution products. Alternate quotations are requested for copper and aluminum versions of such products (Gx 270, R. 2383; Gx 271, R. 2385; Gx 272, R. 2387; R. 774), and the purchaser may choose copper even though the aluminum cable, itself, is cheaper (R. 768; AR 41, R. 3396; R. 890-91). Moreover, as a Government witness testified, even companies presently using aluminum in their overhead lines appraise the pros and cons of copper and aluminum whenever substantial purchases are made, taking into account, in addition to the cost of the cable, "the labor, the installation which may vary depending upon the areas" where the conductor is to be installed, cost differentials in other components, such as connections, and other considerations based on the "characteristics of the two metals." "Sometimes [these factors] are favorable to copper

[39] A 1959 study determined that copper was also more economical than aluminum in service drops from the utility pole to buildings. This determination was reversed the following year because of technological developments that gave aluminum a net advantage (R. 712).

under certain applications and sometimes they are favorable to aluminum" (R. 214-15). The court found that this type of evaluation was required in the purchase of insulated overhead distribution products (Fdg. 28, R. 1289).

Furthermore, electric utilities do not use only weatherproof line wire and multiplex cable in their overhead distribution lines, but may also purchase other, more complicated products. When this occurs, copper will frequently be cheaper, since "the more sophisticated the conductor is away from the bare conductor, the less the differential is between copper and aluminum" (R. 216; *supra*, p. 15). The record shows that utilities have requested alternative quotations from Rome on more complicated overhead distribution products. In many instances, the copper alternate was cheaper; in others, aluminum prevailed.[40] While the more sophisticated constructions are not as widely used in overhead distribution systems as the simpler products, they are not insignificant.[41]

That copper conductor products are a significant factor in the overhead distribution field, notwithstanding aluminum's apparent price advantage in the simpler products, is indicated by the court's finding that even as to such products "substantial quantities are sold with copper as the conductor" (Fdg. 29, R. 1289).

---

[40] R. 760-66, 773-74; AR 34, R. 3361; AR 35, R. 3365; AR 36, R. 3373; AR 37, R. 3375; AR 38, R. 3381; AR 39, R. 3388; AR 40, R. 3394.

[41] Figures as to total usage of pre-assembled aerial cable and other more sophisticated constructions in overhead distribution are not available. Rome's sales of these products in 1958-1960 for use in low-voltage (secondary) and high-voltage (primary) distribution systems (R. 1280-1282) amounted to nearly $1 million.

This finding, not challenged by the Government, is fully supported by the record. The Government's own survey shows that on a footage basis, copper represented 22.8 per cent of gross additions to insulated overhead distribution lines in 1959 (Gx 468, R. 2740). In dollar terms, this would amount to well over $15 million.[42] Moreover, data available for several manufacturers show that their copper weatherproof and service drop cable sales in 1958 equalled or even exceeded in value their sales of the aluminum counterparts (AR 65, 66, 67, R. 3416-18). With respect to weatherproof alone, copper exceeded aluminum by as much as two or three to one (*ibid.*).

The substantial sales of copper in overhead distribution products, the purchasers' practice of comparing copper and aluminum on the basis of overall economics, and the close price relationship in the case of more sophisticated constructions, all sustain the court's finding that copper-aluminum competition is "lively" and "active," and refute the Government's contention that close competition, such as may exist between medium and low-priced shoes, cannot occur with respect to copper and aluminum insulated products. The existence of such competition, though not necessary to sustain the court's line of commerce determination in light of the industry's practice and usage, and the absence of unique production facilities, distinct customers, and specialized vendors, nevertheless, reinforces the conclusion that it would be unrealistic to hold that

---

[42] The 1958 Census of Manufactures shows a total dollar value of $66 million for weatherproof and service drop cable (copper and aluminum combined) (AR 67, R. 3418). 22.8 per cent of this would be $15 million, but this understates the dollar value of the copper versions of these products by a "fairly large" amount since they tend to be more expensive than their aluminum counterparts (R. 320).

the manufacture and sale of insulated aluminum conductor is a separate "area of effective competition."

(b) *It Has Not Been Shown That Copper-Aluminum Competition in the Insulated Field will Disappear*

Recognizing that the above findings imperil its line of commerce position, the Government argues that copper-aluminum competition is rapidly disappearing, and that it is only a matter of time until copper is displaced in the insulated field to the same extent as in bare transmission. Had such displacement progressed further, it argues, the court would presumably have recognized insulated aluminum conductor as a separate submarket, "for it found bare aluminum to be a 'line of commerce' largely on the ground that it had 'practically displaced copper for use in overhead transmission lines' " (Govt. Br., pp. 41-42).

The fallacies in this argument are manifold. First of all, it is simply not true that bare aluminum was found to be a line of commerce "largely" because it had virtually displaced copper in overhead transmission; equally important were the facts that (i) it is "generally recognized as a separate product classification," and (ii) "the manufacture and sale of these products require special stranding equipment and designing skill" (Fdg. 24, R. 1288; *supra*, p. 15). Thus, not only is there virtually no product competition, but manufacturing processes cannot readily be converted between copper and aluminum, as is true in the insulated field. There can, therefore, be no presumption that further, or even complete, displacement of copper in the field of insulated conductors would have altered the court's line of commerce determination.

In any event, the Government is mistaken in asserting that the record establishes "an unmistakable trend

away from insulated copper in the overhead distribution field" which "would have continued until aluminum had superseded copper to the same degree (94.4 per cent) as it previously had in overhead transmission" (Govt. Br., p. 42). Not only did the court make no such finding, but the Government, in its Proposed Findings and Brief, did not even ask the court so to find. The Government's failure to seek such a finding is easily explained by the record.

First. Sales figures for Alcoa-Rome and other companies whose figures were available to the court do not demonstrate the "unmistakable," continuing trend now urged by the Government. In fact, the figures as to the dollar value of Rome's weatherproof sales show that throughout the 1956-1960 period, copper actually *exceeded* aluminum by a margin of at least 3 to 1. In percentage of total dollar value, copper ranged from 76.7 per cent in 1956 to 87.5 per cent in 1960 (AR 54, R. 3405).[43] General Cable's sales figures for the years 1958 and 1959 show copper weatherproof more than three times as great in value as aluminum weatherproof, and by a greater margin in 1959 than 1958 (AR 65, R. 3416). Its President, testifying in February 1962, stated that General Cable expected to maintain the same balance between copper and aluminum in the future as in the past (R. 996).

Second. It is wholly specious to argue that "the only real differences between the two processes of displacement is that the substitution of bare aluminum for bare copper in overhead transmission started much earlier" (Govt. Br., p. 42). As noted, in the overhead transmission field, aluminum has important technical advantages over copper whereas in the insulated field,

[43] In 1961, this percentage dropped to 77.5 per cent, which still exceeded the 1956 percentage (R. 933).

copper and aluminum are "completely interchangeable from a performance standpoint" and aluminum's cheaper cost as a conductor metal may be offset by any of a number of factors (*supra*, p. 15). These undisputed facts clearly differentiate the two situations.

Third. In arguing that copper is completely disappearing from the overhead conductor field, the Government here seeks to show by argument and inference more than its own report on utility buying practices even purported to establish. In conducting this survey, the Government asked each utility to state whether it "expect[ed] any increase or decrease in 1960 and in subsequent years in the proportion of aluminum to copper used in any classification of . . ." overhead lines (Gx 468, R. 2737, 2774). Varying responses, wholly insufficient to establish any future trend, were received (Gx 468 A, R. 2775-3203). Accordingly, the Government's expert, both in his written report and in testimony, refused to make any projection of the trend beyond 1959, candidly stating that responses as to future use of aluminum were "not susceptible to tabulation and [were] not tabulated in [the] report" (R. 307).

For all of the foregoing reasons, it would be completely speculative to say that competition between copper and aluminum insulated products would ultimately vanish. Certainly, the district court's failure so to find cannot be error, where the Government, itself, did not ask it to find that the 1950-1959 trend would continue, let alone that copper-aluminum competition in the insulated field would disappear. In any event, as argued earlier, even if there were far less product competition than has been shown to exist, the court's unchallenged findings, based on the great preponderance of the *Brown Shoe* indicia, would sustain its ultimate line of commerce determination.

B. The District Court Properly Rejected Aluminum Conductor as a Line of Commerce

The alleged aluminum conductor line is nothing but a mathematical composite of (1) bare ACSR and aluminum cable and (2) insulated aluminum wire and cable (see e.g., Gx 434, R. 2714). If, as argued above, insulated aluminum conductor is not a proper line, this alone should foreclose considering the composite "line" as a separate "area of effective competition," for, as to the insulated segment, important competitive elements are excluded (Add'l. Fdg. 4, R. 1336-37). The analogy to the steel industry advanced by the Government (Br., p. 47, n. 27) is wholly inapplicable, since the court expressly found that the combination of bare and insulated conductor is not "generally recognized in the industry as a separate economic entity or submarket" (Add'l. Fdg. 4, R. 1336-37).[44]

Moreover, even if insulated aluminum conductor were a proper line of commerce, there is no basis in logic or in the competitive realities of the market place for consolidating bare and insulated products. The bare and insulated components have nothing in common, except that aluminum is used as conductor and both are used by utilities for "the same broad purpose of conducting electricity" (Govt. Br., p. 47). They are not even claimed to be competitive with each other (no utility will pay for insulated conductor where bare will suffice; compare R. 1227 and 1228), different equipment and engineering skills are required for their manufacture and sale (Fdg. 24, R. 1288), and, as noted,

---

[44] The Government is incorrect in stating that the district court concluded that aluminum conductor is not a line of commerce "solely on the ground that insulated aluminum conductor, one of its two component submarkets, was not" (Govt. Br., p. 47).

the combination is not recognized as a separate economic entity. In these circumstances, this alleged line of commerce is without competitive significance, and cannot qualify as a "well-defined," "economically significant" product market. *Brown Shoe,* 370 U.S. at 325.

The indisputable effect, if not the purpose, of this synthetic composite line is to obscure the fact that Alcoa and Rome had essentially different interests and strengths in the wire and cable business. In bare aluminum, where Alcoa, though rapidly declining, was still the leader, Rome was *de minimis*; while, in insulated aluminum, where Rome was more than *de minimis,* Alcoa, handicapped by a lack of insulating competence and product diversity, ranked third, far behind two of its competitors (Gx 435, R. 2715; Gx 436, R. 2717). These differences, which the Government seeks to conceal by lumping together noncompetitive bare and insulated products, are revealed by the following table:[45]

1958
(Thousands of Pounds)

		Alcoa		Rome	
	Total	Shipments	% of Total	Shipments	% of Total
ACSR and Aluminum Cable, Bare	175,157	56,990	32.5	537	0.3
Aluminum Wire and Cable, Insulated or Covered	51,346	5,970	11.6	2,411	4.7
Aluminum Conductor Wire and Cable	226,503	62,960	27.8	2,948	1.3

[45] Based on Fdg. 45, R. 1292; Gx 434, R. 2713; Gx 435, R. 2715; Gx 436, R. 2717.

As the above table makes plain, Alcoa's 27.8 per cent derived predominantly (more than 90 per cent) from bare aluminum cable, while Rome achieved its still very minor 1.3 per cent largely by virtue of its insulated aluminum conductor shipments. In essence, therefore, the alleged aluminum conductor line of commerce serves to inflate Alcoa's market share by capitalizing on its position in bare aluminum cable, even though the Government no longer claims any prohibited effect in the bare aluminum conductor line of commerce, itself (Govt. Br., p. 38). The mere fact that the combination of bare and insulated aluminum conductor produces percentage figures resembling those discussed in the *Philadelphia Bank* case (Govt. Br., p. 58) is hardly sufficient to convert the composite line into a meaningful "area of effective competition."

II.

THE GOVERNMENT HAS FAILED TO SHOW THE REQUIRED ANTICOMPETITIVE EFFECT IN EITHER OF THE ALLEGED ALUMINUM CONDUCTOR LINES OF COMMERCE

The essential differences between Alcoa and Rome in the wire and cable field have already been described (*supra,* pp. 11-14). Rome was primarily a manufacturer of insulated copper products, Alcoa was chiefly a producer of bare aluminum cable, and, prior to the acquisition, the only perceptible competitive overlap was in the sale of two simple insulated aluminum conductor products. As to these products, Alcoa ranked third in 1958, with 11.6 per cent of total shipments, and Rome was eighth or ninth, with 4.7 per cent of total shipments (Gx 436, R. 2717). In these circumstances, having examined statistics as to market shares and concentration, evidence as to the historical and commercial background of the acquisition, and, the testi-

mony of approximately 30 industry witnesses, both competitors and consumers, the court concluded that the Government had not sustained its burden of proof on the competitive effect issue, even assuming that each of the alleged aluminum conductor lines had been established (Concl. 8, R. 1303).

Market share and concentration statistics, standing alone, the court found, did not condemn the merger, particularly when viewed in light of Rome's "comparatively small percentages" (Opin., R. 1328), the significant increase in the number of suppliers (Opin., R. 1322), the substantial and continuing market share declines suffered by Alcoa prior to the acquisition and, thereafter, by the Alcoa-Rome combination (Opin., R. 1324),[46] and the unparalleled ease of entry which it found to be "closely related to the question of trends of or concentration in the aluminum conductor lines of commerce . . ." (Opin., R. 1323). Nonstatistical evidence, to a degree unusual, if not unprecedented, in a Section 7 case, affirmatively established the absence of probable anticompetitive effect:

(1) Non-integrated fabricators of aluminum conductor products, most of them called as Government

---

[46] These declines are summarized in the following table (based on Fdg. 45, R. 1292-93):

	1954		1958		1961	
	Alcoa	Rome	Alcoa	Rome	Alcoa	Rome
ACSR and Aluminum Cable, Bare	48.4	0.2	32.5	0.3	26.1	..
Aluminum Wire and Cable, Insulated or Covered	10.0	6.9	11.6	4.7	7.3	5.7
Aluminum Conductor Wire and Cable	42.8	1.1	27.8	1.3	23.5	1.3

witnesses, increased their sales of such products after the acquisition, expanded their facilities for the manufacture thereof, and testified that this acquisition had not adversely affected their businesses (Opin., R. 1330; R. 75-78, 228-31, 380-81, 404, 984-85, 990). No such manufacturer foresaw any future adverse effect from this acquisition (Fdg. 50, R. 1294; Fdg. 62, R. 1295).

(2) Utility purchasing agents, representing 8 of the 10 significant common customers, testified, without exception, that their position as purchasers of aluminum conductor products had not been, and will not be, adversely affected (Fdg. 59, R. 1295).

(3) The increase from 4 to 29 in the number of producers of insulated aluminum products in a ten year period established "that entry into the aluminum conductor field is dictated by the status of the competition rather than being controlled by actual economic barriers" (Opin., R. 1323; Fdgs. 54-57, R. 1294-95).

(4) There was not substantial or vigorous competition between Alcoa and Rome; for example, business records systematically maintained by Alcoa for two years prior to the acquisition established that only 5/100 of 1 per cent of aluminum conductor business lost to all competitors was lost to Rome (AR 58, R. 3409; Fdg. 52, R. 1294; Opin., R. 1329).

(5) The uncontradicted testimony of utility purchasing agents, and other witnesses, established that Rome was not an aggressive price competitor (Fdgs. 53, 61, R. 1294-95).

(6) Alcoa's purpose was to secure insulating capability and diversify its operations; it was not moti-

vated by Rome's manufacture of aluminum conductor products (Fdg. 7, R. 1284).,

(7) There is vigorous competition in the manufacture and sale of aluminum wire and cable products, which has not diminished since the acquisition (Fdgs. 62, 69, R. 1295, 1297).

The Government does not challenge these findings, and admits that Rome's market shares "may not appear great in absolute terms" (Govt. Br., p. 62). Nevertheless, it argues, Section 7 is violated because Alcoa, "the industry leader in an already oligopolistic product market," has acquired a "significant" competitor (Govt. Br., p. 37; and pp. 2, 49). Whatever might be the validity of this test as a proposition of law, it has no application to the facts of this case. In products where Alcoa was the "leader," Rome was not "significant"; and the glib assumption that this case involves "an already oligopolistic product market" is wholly without support in the record and contrary to the court's express finding that there is vigorous competition.

In formulating the Questions Presented, and throughout its argument on the merits, the Government floats and slides from bare aluminum conductor, to insulated aluminum conductor, to a composite of the two, and for good measure intersperses irrelevant observations concerning the primary aluminum industry. In order more clearly to show the true facts and circumstances of this case, we shall discuss separately each of the alleged aluminum conductor lines.

A. Anticompetitive Effect Has Not Been Shown With Respect to Insulated Aluminum Conductor

(1) Alcoa Was Not And Is Not The "Largest Producer" of Insulated Aluminum Conductor

Although frequently throughout its Brief, the Government refers to Alcoa as "the largest producer," the "industry leader," or "a dominant firm" (e.g., Govt. Br., pp. 2, 37, 49), these epithets do not fairly describe Alcoa's position with regard to insulated aluminum conductor. In this field at the time of the acquisition, Alcoa, with 11.6 per cent of 1958 shipments, ranked a poor third, more than 60 per cent behind Kaiser, with 26.8 per cent, and more than 30 per cent behind Anaconda, with 16.9 per cent (Gx 436, R. 2717). Moreover, it lacked insulating capability and product diversity possessed by many of its competitors. For these reasons, the court's finding that Alcoa did not occupy a dominant position is clearly pertinent to insulated aluminum conductor field (Opin., R. 1326-27).

The Government makes no claim that the simplified test enunciated by this Court in *United States* v. *Philadelphia Bank*, 374 U.S. 321, 363 (1963), is applicable to insulated aluminum conductor (see Govt. Br., p. 58).[47] Rather, its argument as to this line appears to focus upon the allegedly "concentrated" and "oligopolistic" character of the "market" and Rome's "significance" as a competitor. The findings and the evidence, however, make clear (1) that there is vigorous

---

[47] This Court there created a rebuttable presumption of illegality applicable to "a merger which produces a firm controlling an undue percentage share of the relevant market, and results in a significant increase in the concentration of firms in that market . . ." 374 U.S. at 363. The Government attempts to invoke this test only with respect to its alleged composite aluminum conductor line. (Govt. Br., p. 58).

and effective competition in the sale of insulated aluminum conductors, and (2) that Rome's significance as a competitive force was even less than its admittedly small market share would indicate (see Govt. Br., p. 62).

(2) Insulated Aluminum Conductor Is Not "Highly Concentrated" or "Oligopolistic"

The Government claims that a "pattern of concentration prevails" in insulated aluminum conductor because in 1958 five integrated producers accounted for 65.4 per cent of total shipments, and because in 1959, 11 companies had market shares of 1 per cent or more (Govt. Br., pp. 20, 52). Solely on the basis of these figures, it describes the alleged insulated aluminum "market" as "highly oligopolistic" and "highly concentrated" (Govt. Br., pp. 37, 52, 62). The Government's basic misconception is to assume that concentration percentages, which may be significant when speaking of an industry, such as banking, where barriers to entry are high, can be applied mechanically to a few wire and cable products using aluminum instead of copper as conductor.

Such an oversimplified, numerical approach ignores this Court's admonition in *Philadelphia Bank* that the competitive effect question is not "susceptible of a ready and precise answer in most cases," since it requires a prediction of future competitive conditions which must be "based upon a firm understanding of the structure of the relevant market. Yet, the relevant economic data are both complex and elusive" 374 U.S. at 362. And, as exemplified by the analysis of market structure undertaken by Commissioner Elman in *Procter & Gamble*, FTC Dkt. 6901, 3 CCH Trade Reg.

Rep. ¶16,673, p. 21,568, the plaintiff's burden under Section 7 "is not met, in any case, by invocation of a talismanic *per se* rule by which to dispense with the need for adducing evidence of probable anti-competitive effect . . . . In every case the determination of illegality, if made, must rest upon specific facts." Such a determination cannot be made "solely on the basis of concentration data or other simple statistical materials."[48]

(a) *Concentration Percentages Are Not A Reliable Measure of the Structure or Competitiveness of a Market*

In part, the Government approach is fallacious because the alleged insulated aluminum conductor line of commerce excludes entirely the enormous insulating capacity presently used on copper, but which can "readily" be allocated to aluminum (Fdgs. 55, 56, R. 1294-95). The irrelevance of concentration percentages in these circumstances is recognized by economists. As stated by Kaysen and Turner:

> Where producers can and do produce several products interchangeably, the capacity currently devoted to one of those products understates the amount that should fairly be deemed to be "in" the market. Without a minimally reasonable definition of markets, criteria based on quantitative shares become whimsy.[49]

---

[48] Kaysen and Turner, *Antitrust Policy* 24 (1959).

[49] *Antitrust Policy* 134. Professor Chamberlin makes the same point:

> . . . Concentration ratios and similar measures are of little significance because they are predominantly the result of how broadly the categories are defined. Chamberlin, "Measuring the Degree of Monopoly and Competition," in *Monopoly and Competition and Their Regulation* 262. See also Kaysen, *Business Concentration and Price Policy* 117.

We think "whimsy" fairly describes the Government's reliance on concentration percentages in this case.

Furthermore, even when the relevant market is properly delimited, concentration measures alone do not explain the economic behavior of a market.

> It seems vain to expect that numbers and size distribution alone will explain market behavior and therefore equally vain to hope for more from concentration measures than that they should provide a preliminary basis on which resources for further study should be allocated.[50]

And, as the Senate Subcommittee on Antitrust and Monopoly has warned:

> Bare statistics necessarily omit many qualitative factors which are essential to a complete understanding of the competitive structure of the entire industrial economy or of an individual industry.[51]

Thus, seller concentration is only one aspect of what economists term market structure, i.e., "those conditions external to the firm which are relatively per-

---

[50] Kaysen in *Business Concentration and Price Policy* 118. In their more recent study of antitrust policy, Kaysen and Turner make the same point: "In general, the application to individual markets of any criterion we choose requires a fairly thorough industry study and cannot be done solely on the basis of concentration data or other simple statistical materials" *Antitrust Policy*, 25. Similarly, Professor John Perry Miller of Yale has stated: "... it appears both on a priori grounds and on the basis of such empirical evidence as we have that the extent of concentration is only one of several important variables to be examined, whether the interest is in economic analysis or public policy" *Business Concentration and Price Policy* 135.

[51] *Concentration in American Industry*, 85th Cong., 1st Sess., p. 4 (1957).

manent or which change only slowly, and which affect, if they do not determine, the way the firm operates."[52] Although an important variable, concentration "is not the only such variable and it cannot be adequately understood apart from others" *Procter & Gamble, supra*, p. 21,570. Other factors that must be considered in order to achieve the "firm understanding" of market structure required in Section 7 cases are the condition of entry into the market, and the degree of product differentiation.[53] Moreover, prediction of future market conditions also requires consideration of market performance.

> Since we are interested in the future as well as in the past, we look at structure as well as performance, in order to correlate as well as we can the observed performance with the observable features of market structure, and thus be able to predict the probable relation of future to past performance.[54]

Here, an examination of the alleged insulated aluminum line in light of relevant market structure and per-

---

[52] Kaysen and Turner, *Antitrust Policy* 59.

[53] See Bain, *Industrial Organization* 8 (1959); Kaysen and Turner, *Antitrust Policy* 71-75; Machlup, *The Economics of Sellers' Competition* (1952); *Procter & Gamble, supra*, pp. 21,570-21,572. Another market structure variable sometimes cited by economists is strength of buyers, *Industrial Organization* 8, 138-143; *Procter & Gamble, supra*, p. 21,570, n. 24. While this factor is often discussed in terms of buyer concentration (oligopsony), the fact that buyers are large and well-informed will affect the vigor of competition, even though oligopsony may not exist. Here, the fact that many utilities buying insulated aluminum products are extremely large organizations with skilled engineering staffs contributes significantly to the vigor of competition (*infra*, p. 60).

[54] Kaysen and Turner, *Antitrust Policy* 75.

formance criteria will show that it is effectively and vigorously competitive, not "concentrated" or "oligopolistic."

(b) *There is Unparalleled Ease of Entry*

Condition of entry refers to the relative ease or difficulty with which new sellers may enter the market, as determined generally by the advantages which established sellers have over potential entrants. It is deemed a structural variable so important as to be "a co-regulator of business conduct and performance" along with actual competition among existing sellers.[55] With easy entry, a situation exists:

> in which there is no impediment to the entry of new firms, in which established firms possess no advantages over potential entrant firms, or in which, more precisely, established firms cannot persistently elevate price by any amount above the competitive minimal-cost level without attracting sufficient new entry to bring price back to that level.[56]

Kaysen and Turner foresee the same consequences where condition of entry is easy:

> [I]n the long run, the maintenance of market power, whether by a single firm or by a group, implies the existence of significant barriers to entry into the market by new sellers. Without such barriers, the attempt to exercise power would in general attract new sellers . . .[57]

---

[55] Bain, *Barriers to New Competition* 3 (1956).

[56] Bain, *Barriers to New Competition* 11.

[57] *Antitrust Policy* 77; Professor Machlup regards condition of entry as such an important structural concept that he formulates a separate economic model and calls it pliopoly (the Greek *plio* or "more" plus *polein* or "to sell," hence *pliopoly*) for the ready appearance of "more sellers" in the market. *The Economics of Sellers' Competition* 102-109.

Economists are careful to distinguish between the true determinants of entry and transitory factors that may influence the current record of accomplished entry.

> The true determinants are the things that determine for established firms the possible price-cost relations which would and would not induce entry; they are not those things determining whether or not actual entry takes place at a particular time.[58]

Generally regarded as among the most critical "true determinants" of entry are (i) absolute cost advantages, (ii) product differentiation, (iii) economies of large scale, (iv) uncertainty, and (v) entry lag. Analysis of these factors is important not only because they determine the condition of entry, but also because they strongly influence "the competitive vigor of the existing firms in the market . . ." *Procter & Gamble, supra,* p. 21,571, n. 27. As will now be shown, not a single one of these entry (and competition) retarding factors operates in the alleged insulated aluminum conductor field.

(i) Existing firms do not have any absolute cost advantage

Existing firms in an industry will enjoy an absolute cost advantage over potential entrants where

> the entrant either must use inferior production techniques or must pay higher prices for productive factors such as labor, materials, plant, and money capital.[59]

In the present context, it at least approaches "whimsy" even to discuss "absolute cost advantages" since there

---

[58] Bain, *Barriers to New Competition* 17.

[59] Bain, *Barriers to New Competition* 144.

are numerous experienced and capable wire and cable fabricators already using equipment and techniques which can be applied interchangeably to either copper or aluminum products (Fdgs. 55, 56, R. 1294-95). Moreover, products chiefly made from aluminum are among the simplest of all insulated constructions. No patents or secret processes are involved, and surely there is no reason to believe that Kennecott, Phelps Dodge, American Steel and Wire Division of U.S. Steel, and other existing manufacturers must pay more for labor, materials, plant and capital than their fellow insulators who happen, at this moment, to be using both aluminum and copper.

(ii) There is no product differentiation in insulated aluminum conductor

> [T]he most important barrier to entry discovered by detailed study is probably product differentiation.[60]

Product differentiation is based generally on the susceptibility of buyers to persuasive appeals, usually through advertising, concerning the alleged superiority of the products of individual sellers. It flourishes where buyers are relatively uninformed as to the merits of alternative products, and where there is the opportunity for producing significantly different designs and qualities of goods in question.[61] "Such preferences need not, and frequently do not, rest on real or substantial differences in terms of quality or usefulness" *Procter & Gamble, supra*, p. 21,571. The existence of product differentiation will "make entry for a new firm

---

[60] Bain, *Barriers to New Competition* 216.

[61] Bain, *Industrial Organization* 219.

difficult in that it must overcome the established good will of existing sellers."[62]

It is beyond question that no product differentiation exists in the alleged insulated aluminum line of commerce. The few simple insulated wire and cable constructions in which aluminum is used are manufactured according to standardized technical requirements (AR 25-28, R. 3267-3343), and can be produced by virtually any insulating firm (Fdg. 55, R. 1294; Fdg. 84, R. 1299). Appeals to buyers, usually in the form of product bulletins and catalogues, are not made in terms of "differentiating" the products but of *conforming* them to the accepted standards (AR 30-31, R. 3345-56). The only purchasers of such products—electrical utility companies—are large, well-informed buyers who can and do purchase these products from any producer meeting the industry's standards (e.g., R. 801, 806, 813, 899).[63]

---

[62] Kaysen and Turner, *Antitrust Policy* 74. Product differentiation may also protect the market shares of established firms, making it difficult for other existing firms to expand, and, therefore, as noted, *supra*, p. 56 is regarded as a prime market structure variable as well as a determinant of condition of entry (*infra*, pp. 64-65). See also *Procter & Gamble*, *supra*, p. 21,571.

[63] The lack of product differentiation is not surprising since it is more likely to prevail with respect to consumer goods than industrial commodities, such as wire and cable. "Producer buyers tend in general to make it their business to be well-informed as to the qualities and properties of the goods they buy, and are thus less susceptible to the persuasive appeals of sellers. In addition, their task is frequently simplified by the fact that numerous producer goods are standardized, uniform raw materials, the suppliers of which find little opportunity for introducing physical product differentiation among their outputs" Bain, *Industrial Organization* 219.

(iii) Economies of large scale do not inhibit entry

Economies of the large plant or firm refer to a decline in unit costs as the scale of the plant or firm is increased. Where significant scale economies are present, an entrant must add a significant fraction to industry output in order to operate at the minimum optimal scale. The result of entry on such a scale may be a decline in prices, making it uneconomic to continue, or established firms may retaliate against the entrant by lowering prices. In these circumstances,

> the entrant is not only being made to play the competitive game for high stakes, but, by being forced to enter on a large scale, he is virtually ensuring a swift competitive response by the established firms. *Procter & Gamble, supra,* p. 21,571.

On the other hand, if the entrant comes in at a scale small enough to be "unnoticed," he would be operating at a suboptimal level and have higher costs than established firms.[64]

No such barriers are present as to insulated aluminum. Existing insulating companies can enter on a small scale or on a large one, depending on market conditions, with no capital investment whatever (Fdgs. 55, 56, R. 1294-95; e.g., R. 73-74, 251, 280-81, 379-80, 661-62, 983). Their efficiency is determined by their existing scale of operation and production techniques, not by the amount of aluminum used as conductor.

---

[64] The significance which economists attach to economies of scale is indicated by Professor Markham's statement that "[t]he most important single determinant of the degree of competition in a given industry is the shape of the long-run cost curve confronting the prospective entrant." "Economic Analysis," *Proceedings*, Section of Antitrust Law, American Bar Association (April 1954), p. 149.

(iv) Uncertainty as to market conditions does not impede entry

Uncertainty refers to a potential entrant's lack of knowledge of the industry he might enter, and particularly lack of knowledge as to whether a profit can be made.

> The more uncertain the prospects appear in an industry, the more imperfect will entry be and the greater may be the profits of the firms established in the industry, sheltered by the deterrent uncertainty.[65]

No such difficulty besets existing insulators who may wish to "enter" the alleged insulated aluminum line of commerce. Since they are already in the insulating business, they know the cost and efficiency of the machinery and personnel to be used, and are fully conversant with customer requirements, there being no "distinct customers" for copper and aluminum insulated products (Opin., R. 1316; see e.g., R. 73).

(v) The effectiveness of easy entry is not impaired by entry lag

Even where there are no significant entry barriers, the time required to effect entry (i.e., "lag,") may limit the effectiveness of easy entry as a guarantor of vigorous competition. Thus:

> [t]he longer the lag period in question, the less influence any given threat of entry will be likely to have on established sellers. . . . The *effect* of any given condition of entry on market behavior will therefore be likely to vary with the length of the entry lags which accompany it.[66]

---

[65] Machlup, *The Economics of Sellers' Competition* 231; see 107, 228-230.

[66] Bain, *Barriers to New Competition* 11; See also Machlup, *The Economics of Sellers' Competition* 108.

Here, lag is nonexistent because "entry" is not only easy, but virtually instantaneous (e.g., R. 73-74, 379-80, 661-62, 982-83).

(c) *Easy Entry Assures Vigorous Competition Among Existing Firms*

As the foregoing makes plain, insulated aluminum is characterized by an extraordinarily easy condition of entry. One consequence of this is the high probability that in the future additional manufacturers will allocate part of their insulating capacity to aluminum.[67] But this is not the only significance of easy entry, for where this condition prevails, vigorous and effective competition is assured even where no actual entry occurs.

First of all, where, as here, potential entrants exist and the market structure is favorable to entry, these conditions will bring about vigorous and effective competition among the existing firms (*supra,* p. 58). This very point is now being urged by the Government in *United States* v. *Penn-Olin Chemical Company,* No. 503, this term, where it argues:

> The presence of a potential entrant—waiting in the wings and capable of moving into the market—may be an indispensable source of protection for purchasers and ultimately the consuming public. Its readiness to enter the market whenever the existing manufacturers charge excessive prices, limit production, or fail to exploit economic opportunities (e.g., to develop more efficient productive techniques) can act as a spur to insure the competitive vigor of those already in the market. "If

[67] As will be discussed below, this process is already under way (*infra,* pp. 68-69).

> economic superiorities of some kind are not possessed by the existing few, entry of new rivals is a continuing threat, likely to enforce behavior approaching the competitive norm." Weston, *The Role of Mergers in the Growth of Large Firms* (1953) 109; Brief, p. 25.

Here, to a far greater extent than in the *Penn-Olin* situation, these conditions are satisfied, for there are numerous potential entrants, each able to "enter" the market with far greater ease than could the chemical concerns involved in that case.

Secondly, as Commissioner Elman has observed, "factors making for high entry barriers also make for domination of small competitors by large and so tend to eliminate actual as well as potential competition" *Procter & Gamble, supra,* at p. 21,572. Conversely, where entry retarding factors are absent, the market structure will favor effective competition among existing firms. Particularly important in this regard is product differentiation which is generally regarded as both an entry determinant and a market structure variable in its own right.[68]

Where product differentiation is lacking, sellers will be forced to match the price reductions of rivals in order to hold their customers, and market shares will be determined not by systematic buyer preferences,

> but at random or as a result of a past sequence of historical developments in the establishment and growth of firms. The individual firm is generally not well protected in its going share of the market by any specific structural conditions, and is potentially vulnerable to losses in proportionate con-

[68] E.g., *Procter & Gamble, supra,* 21,571; Kaysen and Turner, *Antitrust Policy* 74; Bain, *Industrial Organization* 210-221.

trol of the market because of the growth of other firms, their pricing policies and so forth.[69]

As will now be shown, because of the absence of product differentiation and other competition retarding market characteristics, there is aggressive price competition with respect to insulated aluminum conductor products and suppliers of such products have been "vulnerable to losses in proportionate control of the market because of the growth of other firms . . ."

(d) *Market Performance Demonstrates the Effectiveness of Competition In Insulated Aluminum Conductor*

As noted, prediction of future economic conditions requires a coordinated evaluation of both market structure and performance. Here, examination of actual performance confirms what is so clearly indicated by the foregoing analysis of market structure, namely, that competition is vigorous and effective.

(i) There is active price competition

The district court found that there is vigorous competition among all manufacturers of insulated aluminum products (Fdgs. 62, 69, R. 1295, 1297; Opin., R. 1330). Such competition is manifested in price-cutting by both small and large firms. Alcoa lost millions of pounds of insulated aluminum business on a price basis to both small and large competitors, including such independent companies as Nehring, Southwire, General Cable, Central Cable, and Essex (AR 29).[70] More-

[69] Bain, *Industrial Organization* 216.

[70] During the same period, it lost virtually no aluminum conductor business to Rome (Fdg. 52, R. 1294; AR 58, R. 3409). AR 29, as well as AR 72 which is referred to below (pp. 68-69), is not in the printed record but is part of the original record filed with the Clerk.

over, the Government, itself has acknowledged the aggressive price-cutting practices of such firms as Central and Nehring (Govt. Br., pp. 62, 64).[71]

The experience of utility companies in competitive bidding further demonstrates that price competition is not confined to the larger suppliers. In 1959, Circle Wire and Cable Company, too small to be listed by the Government among the 1958 sellers of insulated aluminum conductor (Govt. Br., p. 20), was awarded 22 per cent of Long Island Lighting Company's aluminum conductor business. Essex went from zero in 1959 to 29 per cent in 1960. In part, these gains were at the expense of Anaconda and Alcoa which dropped from a combined 66 per cent of Long Island's business in 1958 to 10 per cent in 1961 (AR 81, R. 3507). Similarly, when Central Illinois Public Service Company was dissatisfied with the price and other terms for aluminum triplex, it requested bids from two smaller suppliers. A considerably lower price and better terms were obtained, which eventually the larger suppliers had to match (R. 891-93). Overall, as a result of vigorous price competition, list prices of insulated aluminum products are substantially below what they

---

[71] The Government's claim that the alleged insulated aluminum line of commerce is an "oligopolistic" market (Govt. Br., pp. 2, 37) is inconsistent with the admitted aggressive price cutting of small firms. In an actual oligopolistic market, small firms "tend to exist at the sufferance of their large rivals, and for that reason are likely to opt for peaceful coexistence—not vigorous competition—with those rivals." *Procter & Gamble, supra*, p. 21,569. Similarly, in *Philadelphia Bank*, this Court referred to the fact that in an oligopolistic market, "small companies may be perfectly content to follow the high prices set by the dominant firms . . ." Footnote 43, at p. 367.

were in 1953, and actual prices in the market place are still lower (R. 243, 399, 833, 1228-29; AR 29).

(ii) There have been significant shifts in market shares

The so-called "insulated aluminum" market has been characterized by significant ups and downs in market shares. Other examples, in addition to the declines suffered by Alcoa and Rome (Fdg. 45, R. 1292-93), are the shift of Southwire from 9th position, with 2.3 per cent, in 1955, to 4th, with 7.4 per cent, in 1956; the increase of Essex from a 7th ranking 4.9 per cent in 1957, to a 5th ranking 6.1 per cent in 1958; the move of General Cable from 7th place, with 5.8 per cent in 1956, to 3rd place, with 11.9 per cent in 1957; and the decline of Kaiser from 26.5 per cent in 1955, to 18.1 per cent in 1956 (Gx 436, R. 2717).

(iii) There has been significant entry

In terms of entry, too, the market has performed as the foregoing structural analysis would indicate. The court found that the abandonment of insulated aluminum products by several companies since 1956 resulted from the "vigorous competition in the products involved" (Opin., R. 1330). The Government argues that such abandonment, together with the fact that since 1955 only one company commenced the manufacture of insulated aluminum products, "dispel the significance of the court's finding that there is 'ease of entry' . . ." (Govt. Br., p. 55). The important fact, however, is not whether actual entry has occurred, but whether underlying conditions are conducive to entry (*supra*, p. 58). Here "there is no evidence which would indicate that any potential producer has been unable to enter the industry when he thought that

a profit could be made therein" (Opin., R. 1323). Indeed, on the basis of the "surge of new entries" experienced in the early 1950's, when rising copper prices increased the popularity of aluminum conductor products (Govt. Br., pp. 24-25, 54), and the industry practice of switching from less to more profitable products (Fdg. 56, R. 1294-95), there can be no doubt that if competition had been less intense, more entry would have occurred.

In any event, despite the vigorous competition, there has been significant "entry." Hatfield Wire and Cable Division of Continental Copper & Steel Industries, Inc., known to be an aggressive competitor (R. 551), has begun making aluminum conductor products (AR 5, R. 3229); and subsequent to trial, too late to be noted in the record, Phelps Dodge, already an important wire and cable fabricator, with assets 18 times Rome's (AR 72), announced plans to offer a full line of aluminum conductor products.[12] Moreover, while too insignificant to be listed by the Government as producers of insulated aluminum conductor products in 1958 (Govt. Br., p. 20), General Electric, with assets more than 100 times those of Rome, and Circle, whose parent company, Cerro Corporation, has combined assets 10 times as large as Rome's (AR 72), began to increase their shipments of such products in 1959 (Govt. Br., p. 20). There is nothing in the structure of the insulated aluminum conductor "market" to inhibit the further growth of these very substantial concerns, or to prevent other already

[12] *The Wall Street Journal*, November 18, 1963. In the Government's terms, Phelps Dodge would be "entering" the alleged insulated aluminum line of commerce.

well-established insulating firms from "entering" the field.[73]

[73] The following companies or their affiliates, with consolidated 1960 assets as shown, are among the wire and cable fabricators that are not included among the companies listed by the Government (Govt. Br., p. 20) as suppliers of insulated aluminum conductor in 1958 (AR 72):

	1960 Assets
American Enka Corporation (William Brand—Rex Div.) [AR 73, R. 3443]	$ 100,416,720
Amphenol-Borg Electronics Corp. (Amphenol Cable & Wire Div.) [AR 73, R. 3442]	51,006,381
Cerro Corporation (Circle Wire and Cable Corp.) [AR 73, R. 3443]	249,410,118
Continental Copper and Steel Industries, Inc. (Hatfield Wire and Cable Div.) [R. 943; AR 73, R. 3445]	42,055,627
Electric Autolite Company [AR 73, R. 3444]	146,877,541
General Electric Company [R. 943; AR 73, R. 3445]	2,522,249,000
H. K. Porter Co. (National Electric Div.) [R. 943; AR 73, R. 3447]	132,783,644
International Telephone & Telegraph Corporation (Royal Electric Div. and Suprenant Div.) [R. 943; AR 73, R. 3448-49]	383,296,277
Kennecott Copper Corporation (The Okonite Co.) [R. 943; AR 73, R. 3447]	807,554,096
Neptune Meter Company (Revere Corp.) [AR 73, R. 3448]	34,791,595
Phelps Dodge Corporation [R.943; AR 73, R. 3447]	426,968,025
Simplex Wire and Cable Co. [R. 943; AR 73, R. 3448]	24,535,020
Sprague Electric Company [AR 73, R. 3449]	47,535,846
Tennessee Corporation (Chester Cable Div.) [R. 943; AR 73, R. 3443]	92,811,785
Triangle Conduit and Cable Company [R. 943; AR 73, R. 3449]	32,190,895
United States Steel Corporation (American Steel and Wire Div.) [R. 943; AR 73, R. 3442]	4,626,800,000
Westinghouse Electric Corporation [AR 73, R. 3450]	1,521,138,112

Conclusion as to the Alleged "Highly Concentrated" and "Oligopolistic" Market in Insulated Aluminum Conductor. On the basis of the foregoing, it is abundantly clear that the bare concentration statistics mechanically applied by the Government do not adequately describe the nature of competition in the alleged insulated aluminum conductor line of commerce. The crucial "observable features of market structure," when correlated with "observed performance,"[74] establish that competition in this alleged line is effective and vigorous. As will now be shown, the Rome acquisition will not affect the prevailing vigor of competition.

(3) The Acquisition of Rome Will Not Affect Market Structure or the Vigor of Competition in the Manufacture and Sale of Insulated Aluminum Products

(a) *The Acquisition of Rome Did Not and Will Not Change Pre-existing Market Structure*

The Rome acquisition has not had and cannot have any effect on the condition of entry or product differentiation market structure variables discussed above. Here, unlike *Procter & Gamble*, where already high entry barriers were "markedly heightened by the merger" (*supra*, p. 21,579), the essential entry conditions are unchanged. As the court found, there is no reason to believe that anyone "has been or probably will be deterred from entering into the manufacture and sale of aluminum conductor wire and cable products because of this acquisition" (Fdg. 58, R. 1295).

Moreover, even in terms of the one structural variable emphasized by the Government, i.e., seller con-

[74] Kaysen and Turner, *Antitrust Policy* 75.

centration, this acquisition is not substantial. Alcoa's share in 1958 was 11.6 per cent, and Rome's 4.7 per cent. The sum, 16.3 per cent, is not only far below the 30 per cent conservatively computed in *Philadelphia Bank*, 374 U.S. at 364, but is substantially beneath the 20 to 25 per cent figures suggested as a test of *prima facie* unlawfulness by the economists cited in footnote 41 of that opinion. 374 U.S. at 364.

The impact, in bare statistical terms, becomes even more tenuous in light of the substantial post-acquisition decline from a combined high of 16.6 per cent in 1959 to 13 per cent in 1961. Thus, on the basis of the latest information available to the court, the market share of Alcoa-Rome combined is only 1.4 percentage points above the 11.6 per cent share held by Alcoa alone in 1958.

The acquisition's effect on the number and size distribution of firms in the alleged market as a whole is equally insignificant. Prior to the acquisition, Alcoa ranked third; after the acquisition, the Alcoa-Rome combination was still third, and still substantially behind Kaiser and Anaconda (Gx 436, R. 2717). Moreover, the aggregate share of the five integrated producers has remained virtually unchanged. From a combined 65.4 per cent in 1958, the same five companies at the end of 1961 accounted for 66.5 per cent, an increase of only 1.1 percentage points. Such increase in concentration not only is far below the 33 per cent increase deemed significant in *Philadelphia Bank*, but also is substantially below the 7 or 8 percentage point increase suggested by Professor Bok as a possible statistical test. *Philadelphia Bank, supra*, footnote 41.

Such a minute increase in "concentration," upon which the Government apparently relies (Govt. Br., pp. 56-57), could only have relevance if it adversely affected or eliminated the "possibility of eventual deconcentration" where "concentration is already great." *Philadelphia Bank*, 374 U.S. at 365, footnote 42. Thus, in *Procter & Gamble, supra*, p. 21,583, already formidable barriers to entry were made "virtually insurmountable" by the acquisition, and, as a result, "virtually all possibility of an eventual movement toward deconcentration in the liquid bleach industry was eliminated." Here, in sharp contrast, insulated aluminum conductor is not concentrated in any meaningful sense of the word, entry barriers are nonexistent, and the acquisition, itself, has not changed the condition of entry (Fdg. 58, R. 1295). Moreover, as will now be shown, Rome, a steadily declining factor in insulated aluminum conductor, was among the least likely sources of "deconcentration."

(b) *Rome Was Even Less Important Than Its Small Market Share Would Indicate*

The Government contends that this acquisition eliminated substantial competition because Rome, though not large in absolute terms, had "competitive significance [that] transcends its bare market percentage" (Govt. Br., p. 60). This, the Government argues, was because it was one of only a few "effective firms in the industry" (*ibid.*), because it was an "aggressive competitor" and product innovator (Govt. Br., pp. 62-63), and because its presence in the market preserved "the possibility of eventual deconcentration" (Govt. Br., p. 64). These contentions misconceive both the nature of the alleged market and Rome's competitive role therein.

First, the assumption that there are only a "few significant competitive factors" in the insulated aluminum conductor field presupposes that this is a sharply delimited "industry" confined to the 11 or 12 companies each of which happened in a given year to account for one per cent or more of total insulated aluminum conductor shipments. This, of course, totally ignores the more than 200 established firms ready, willing and able to make insulated aluminum conductor products, including such substantial companies as Okonite, Westinghouse, Hatfield, General Electric, Circle, Triangle, American Steel and Wire, Crescent and Simplex, which, though still comparatively minor suppliers of insulated aluminum conductor, are, nevertheless, substantial concerns with a potentiality for expansion that would not ordinarily be true in the case of "fringe" competitors (*supra*, n. 73). Finally, the implication that there may be an inadequate number of companies is flatly refuted by the testimony of utility purchasing agents all of whom made clear that both before and after the Rome acquisition there were more than enough suppliers of insulated aluminum conductor products. (Opin., R. 1326, Fdgs. 59, 60, R. 1295; R. 721, 750, 801, 806, 810-12, 886-87, 893-94, 897-98).

Secondly, the court found and the Government concedes, that "Rome was not an aggressive price competitor" in the sale of aluminum conductor products (Fdgs. 53, 61, R. 1294-95; Govt. Br., p. 62). This is of critical importance, for, as emphasized by Kaysen and Turner, "the fact that the acquired company has been an active influence on prices" should be among the factors required in order to find illegality where, as here, market shares are "fairly small," i.e., a com-

bined percentage of less than 20 per cent.[75] Seeking to overcome Rome's passive role and to inflate its competitive importance, the Government asserts that Rome was "shown to be an 'aggressive competitor'" and was a product innovator in the field of aluminum insulation (Govt. Br., pp. 62-63). It does not even attempt, however, to explain precisely how Rome could have been "aggressive," yet, as the court found, adhere "to the policy of not going below the prices of its competitors" (Fdg. 53, R. 1294).[76]

Likewise, as shown earlier (*supra*, pp. 11-13), Rome's insulating proficiency, research activities and product innovation, all related to its line of sophisticated products, where "copper remains virtually unrivaled" (Govt. Br., p. 17), not to the two simple products in which aluminum has gained acceptance. The implication that Rome had developed an important insulated aluminum conductor product is misleading for the product in question was actually developed by Rome in the late 1940's using copper as the conductor metal (R. 936). There is no proof in this record that Rome has pioneered the develop-

---

[75] Kaysen and Turner, *Antitrust Policy* 133. The only other factor singled out is "severe limitations on entry."

[76] The alleged showing that Rome, though not a price competitor, was, nevertheless, an "aggressive competitor" is based entirely on the statement of Rome's President, who, though acknowledging that Rome was not a price cutter, asserted that it was an "aggressive competitor" (R. 937). This, of course, was a perfectly natural statement for the President and one of the founders of the company to make. Utility purchasers who were in a position to compare the aggressiveness of Rome with that of other suppliers, testified "without contradiction that Rome was not an initiator of price reductions." (Fdg. 53, R. 1294).

ment of even a single insulated aluminum conductor product.

Finally, the Government's argument that the independence of Rome should be maintained in order to preserve the possibility of eventual deconcentration is wholly without substance. As shown in detail, insulated aluminum conductor is not "concentrated" or "oligopolistic" and there is no shortage of established insulating companies that can effect even further decentralization. Rome was one of the companies least likely to expand, for it was not an aggressive price competitor and, prior to the acquisition, had been a declining factor in insulated aluminum conductor, its percentage having fallen from 6.9 per cent in 1955 to 4.7 per cent in 1958 (Gx 436, R. 2717).

For all of the foregoing reasons, it is clear that the Government failed to sustain its burden of proof on competitive effect with respect to the alleged insulated aluminum conductor line of commerce.

B. The Required Anticompetitive Effect Has Not Been Shown With Respect to the Alleged Aluminum Conductor Line of Commerce

(1) The Lack of Anticompetitive Effect as to Each Component Demonstrates the Absence of Such Effect as to the Alleged Composite Line

The Government's second alleged line of commerce is nothing but a mathematical composite of (1) insulated aluminum wire and cable, and (2) ACSR and aluminum cable, bare. With respect to item (1), the Government makes no claim of presumptive or *per se* illegality and, as just demonstrated, has failed to show anticompetitive effect. As to item (2), the Government has not even appealed from the district court's

conclusion that the prohibited effect was not shown. Since the Government concedes the absence of prohibited effect in bare aluminum, which constitutes more than 90 per cent of Alcoa's share, and 77 per cent overall, of this alleged line of commerce (Govt. Br., p. 11), and has shown no prohibited effect as to insulated aluminum, it is nothing short of incredible to claim that the requisite effect can somehow emerge when bare and insulated aluminum conductor are lumped together.

(2) The Market Percentages on Which the Government Relies Are Devoid of Economic Significance

With due respect, we submit that the Government's composite line is simply a numerical trick, calculated to give the appearance of substantiality where the market facts and industry testimony demonstrate that none exists. As noted above, Alcoa's 27.8 per cent of this composite line was more than 90 per cent bare aluminum conductor, while Rome's very minor 1.3 per cent consisted almost entirely of insulated aluminum products (*supra*, p. 47). Since bare and insulated products are not even claimed to be competitive, and since the combination was found not to constitute a recognized economic entity or submarket (Add'l. Fdg. 4, R. 1336), the combination of the two is utterly without economic or competitive significance. Certainly, in these circumstances, the combined percentage of 29.1 per cent does not manifest the "inherently anticompetitive tendency" which this Court found justified reliance upon a rebuttable presumption of illegality based on market shares in the *Philadelphia Bank* case, 374 U.S. at 363.

Moreover, the *Philadelphia Bank* presumption applies to "a merger which *produces* a firm controlling

an undue percentage of the relevant market . . ." (emphasis supplied). In this case it is pure fiction to suggest that this acquisition "produced" the 29.1 per cent figure on which the Government relies. This percentage, as noted, predominantly represents Alcoa's pre-acquisition sales of bare aluminum cable. As such, it is nothing but a point on a steady downward curve reflecting the sharp and continuing erosion of Alcoa's position in bare aluminum cable which has fallen from 48.4 per cent in 1954, to 32.5 percent in 1958, and, combined with Rome, to 26.1 per cent in 1961 (*supra*, p. 6). Because of Alcoa's subordinate role in insulated aluminum conductor, the percentages are somewhat smaller in the composite line, but the identical trend is disclosed: from 42.8 per cent in 1954, to 27.8 per cent in 1958 and, combined with Rome, to 24.8 per cent in 1961. Thus, by the time of trial the Alcoa-Rome combined share in the alleged composite line was more than 40 per cent below that held by Alcoa alone in 1954, and more than 10 per cent below Alcoa's percentage in 1958, the last full year before the acquisition.

Attempting to minimize the significance of these sharp declines, the Government, quoting from Commissioner Elman's opinion in *Procter & Gamble*, suggests that post-acquisition declines "are entitled to little, if any, significance" because a company " 'may deliberately refrain from anti-competitive conduct . . . and build, instead, a record of good behavior . . .' " (Govt. Br., p. 59). This argument has no relevance to this case. Although the Government states that the district court relied on the decline of the merged companies "subsequent to the acquisition" (Govt. Br., p. 59), the fact is that the court repeatedly emphasized the "generally continued" market share declines "both pre and

post-acquisition" (Opin., R. 1324, 1313; Fdg. 45, R. 1292-93). Thus, contrary to the implication of the Government's argument, Alcoa's post-acquisition decline is but a continuation of a trend started long before the acquisition, a fact which demonstrates that market forces, rather than a desire to build a good record for this proceeding, accounted for the decline."[11]

In light of its obviously contrived nature, the failure of proof as to the bare and insulated components, and the substantial and continuing decline in the Alcoa-Rome market share, the Government's claim of illegality as to the alleged aluminum conductor line of commerce is wholly without substance. This conclusion is reinforced by examination of market and historical factors which affirmatively establish the acquisition's lack of effect in either of the alleged aluminum conductor lines of commerce.

C. Market and Historical Factors Found by the Court Affirmatively Establish That Anticompetitive Effect Has Not Been Shown

Where market share statistics are not conclusive, determination of the competitive effect issue requires "an examination of various economic and historical factors . . ." *Brown Shoe,* 370 U.S. at 329. Several of such factors—Alcoa's downward trend, the complete ease of entry, the absence of product differentiation, Rome's passive role in price formation and declining position, the lack of significant competition between Alcoa and Rome, the continued vigor of competition—have already been discussed. We turn now to other economic and historical factors that also affirmatively

[11] Furthermore, although there was extensive pre-trial discovery and virtually every Alcoa official concerned with the post-acquisition operation of Rome was exposed to cross-examination at the trial, there is not even a hint in this record of any attempt on the part of Alcoa to build a record for the purpose of this proceeding.

establish that this acquisition will not have the prohibited anticompetitive effect.

(1) There Has Not Been, and Will Not Be, Any Adverse Effect on Competitors

While Section 7 is concerned primarily with effect on competition, rather than on competitors (*Philadelphia Bank*, 374 U.S. at 367, n. 43), in some cases an acquisition's effect on competitors may be so severe as to create a probability that competition as a whole will be substantially lessened. (See e.g., *Brown Shoe*, 370 U.S. at 344). This, emphatically, is not such a case. At the trial, independent wire and cable manufacturers, most of them Government witnesses, testified as to competitive conditions. Not a single such witness had either experienced, or foresaw in the future, any adverse effect as a result of this acquisition (Fdgs. 50, 62, R. 1294-95). Indeed, several of them had increased their aluminum wire and cable sales since the acquisition, and had either built new plants, or expanded existing plants, in order to increase their capacity for making such products (Opin., R. 1330; R. 74-76, 228, 381, 404-06, 984-85, 990). Moreover, in the three years since the acquisition, independent manufacturers, as a group, increased their sales of insulated aluminum wire and cable by more than 50 per cent, with a corresponding increase in their combined market share from 29.8 per cent in 1958 to 33.5 per cent in 1961 (Opin., R. 1329).

(2) Alcoa's Purpose Was to Obtain Insulating Capability, Not to Expand Its Aluminum Conductor Facilities

Although the Government implies that Alcoa's purpose was to "augment" its already leading position in aluminum conductor (Govt. Br., p. 61), this is contrary to the court's express finding that the purpose was to secure insulating capability and diversification,

and that the acquisition was not induced by "Rome's manufacture of aluminum products . . ." (Fdg. 7, R. 1284). These findings are relevant in a Section 7 case, for, as this Court noted in *Brown Shoe* (370 U.S. at 329, n. 48):

> evidence indicating the purpose of the merging parties where available, is an aid in predicting the probable future conduct of the parties and thus the probable effects of the merger.

Here, the findings as to purpose repudiate the Government's claim that Alcoa sought to "expand" its aluminum conductor operations (Govt. Br., p. 68).

(3) There Is No Significant Merger Trend

Contrary to *Brown Shoe,* where this Court found definite and substantial acquisition trends in which Brown Shoe, itself, was a "moving factor," 370 U.S. at 302, the Court here found neither a "significant pattern or trend of mergers" for the industry as a whole (Fdgs, 46, 49, R. 1293), nor any prior "history of acquisitions or mergers" involving aluminum conductor by Alcoa (Opin., R. 1322).

The court's findings as to the lack of any significant merger trend are strongly supported by the record. The so-called trend consists of the following: Olin-Mathieson, which was not even in the wire and cable business, acquired Southern Electrical;[78] U. S. Rubber, which was never more than an .8 per cent factor in aluminum conductor products, was acquired by Kaiser in 1957; and Roebling, which never was more than a .1 per cent factor and is conceded by the Government to have been an insignificant competitor (Govt. Br., p.

---

[78] The post-trial acquisition of Central Cable by Aluminium Limited, which is referred to by the Government, also did not eliminate or lessen competition since Aluminium was not previously in the wire and cable business.

69), sold some of its used wire and cable machinery to Reynolds (Gx 392, 393, R. 2613-18).

While purporting to acknowledge the underlying facts and not wishing "to overdraw the picture" (Govt. Br., p. 68), the Government urges that these acquisitions were "major step[s] towards the elimination of all independent concerns" (Govt. Br., p. 65), and that "there is reason to apprehend that the remaining independents will eventually be absorbed and the market occupied exclusively by the integrated giants." (Govt. Br., p. 71). This inflammatory, *ad terrorem* argument is wholly without basis in fact.

Not only did none of the prior acquisitions eliminate any substantial competition, but none involved an attempt to expand aluminum conductor operations. Alcoa's purpose has just been discussed, and Reynolds, too, was seeking insulating capability required in order to make its product line more competitive (Gx 387, R. 2606). Similarly, the effect of Kaiser's acquisition of U. S. Rubber was to place it in a position to offer insulated copper products (R. 1080-81).[79] Thus, all

[79] The Government concedes that the Olin-Southern and Aluminium-Central acquisitions eliminated no actual competition. It argues, however, that potential competition was eliminated because "the electrical conductor field is one to which [the primary aluminum producers] would naturally gravitate" (Govt. Br., pp. 69-71). In fact, there is no evidence that any aluminum producer has been able to acquire insulating capability through internal growth. The Government's assertion at this point in the Argument, as in the Statement of Facts, that Alcoa "was prepared to embark upon a large program of internal expansion" does not faithfully reflect the facts of record. As noted, the court found that the time and expense involved "seemed to foreclose" the possibility of Alcoa's obtaining insulating competence from within (*supra*, p. 9). It is ironic that the Government should stress the potential competition of primary aluminum producers not even in the insulating business, yet ignore the literally dozens of already existing insulating concerns that could so much more easily commence the fabrication of aluminum conductor products.

three acquisitions were actually a competitive reaction to the fact that many companies with broad experience in the insulating business had begun to manufacture aluminum conductor products (*supra*, pp. 8-9). They were not, as the Government would imply, attempts to "expand" within the field of aluminum conductor, but were for the purpose of securing insulating know-how.

In these circumstances, unlike the situation in *Brown Shoe*, where shoe manufacturers had economic incentive to engage in a seemingly endless program of "drying up" available outlets (370 U.S. at 301), here the acquiring company's economic incentive is extinguished once it has acquired insulating capability. Thus, explaining Alcoa's lack of interest in future acquisitions, its Executive Vice President testified: "Alcoa was seeking know-how in this insulated wire business and we were satisfied Rome had it and we were not about to buy it twice" (R. 1110; see also R. 1087, 1105). Reflecting this testimony and the commercial background of the acquisition, the court found that the Rome acquisition was not shown to be "part of a continuing program contemplating future expansion through mergers or acquisitions . . ." (Fdg. 11, R. 1284). Since the same appears to be true as to the other minor acquisitions, the Government's concern about the extinction of independents through further acquisition by primary aluminum producers is unfounded (See Govt. Br., pp. 66-67).[80]

---

[80] As throughout its Brief, the Government, of course, assumes that there is a closely limited, static group of aluminum conductor fabricators, and that only those supplying more than a given percentage of the market at any one time can qualify as "significant independents." There are, however, as noted above, substantial concerns such as General Electric, Circle, Phelps Dodge, and Hatfield which are in the process of commencing or expanding the production of aluminum conductor products and, of course, numerous others in a position to do so if market conditions warrant.

(4) There Has Not Been, and Will Not Be, Any Adverse Effect on Consumers

Recognizing that one test of a competitive market is "whether consumers are well served" *Philadelphia Bank*, 374 U.S. at 367, n. 43, appellees offered the testimony of purchasing agents for 8 of the 10 public utilities which bought aluminum conductor products from both companies prior to the acquisition. These witnesses explained in detail the manner in which they purchase these products, identified their suppliers before and after the acquisition, and described Rome's policies and practices. As the court found, these witnesses "all testified without exception that the acquisition has not had an adverse effect upon the purchasers of such products;" that "no difficulty has been encountered in expanding their list of suppliers and that competition among such suppliers has not been affected" (Opin., R. 1326); and that prior to the acquisition, Rome was a follower rather than an initiator of price reductions (Fdgs. 53, 61, R. 1294-95). On the basis of this and other evidence, the court found that consumers "have not been and will not be adversely affected by the Rome acquisition" (Fdg. 59, R. 1295).

CONCLUSION

For all of the foregoing reasons, the district court correctly ruled that the Government had failed to sustain its burden of proof on either the line of commerce or competitive effect issues, and its judgment dismissing the Complaint should be affirmed.

OCTOBER TERM, 1963

No. 204

UNITED STATES OF AMERICA, *Appellant*,

v.

ALUMINUM COMPANY OF AMERICA and
ROME CABLE CORPORATION

APPELLEES' PETITION FOR REHEARING

Appellees petition for rehearing of this Court's decision reversing the District Court's judgment dismissing the Government's complaint under Section 7 of the Clayton Act (15 U.S.C. 18, as amended). Rehearing is requested because this Court has either misconceived or failed to consider basic market and economic facts found and relied upon by the District Court.

1. LINE OF COMMERCE

Meticulously applying the guidelines laid down by this Court in *Brown Shoe Co.* v. *United States,* 370 U.S. 294, 325 (1962), the District Court found and concluded that the wire and cable insulating business is not divisible into separate copper and aluminum "areas of effective competition" and that "aluminum conductor," a composite of bare and insulated aluminum products, also is not a proper line of commerce. In overturning those determinations, this Court has either ignored or repudiated the District Court's unchallenged findings of fact, notwithstanding the mandate of Rule 52(a), Fed. Rules of Civil Procedure, and has substituted its subjective, *ad hoc* judgment for the pragmatic appraisal based on established criteria called for by *Brown Shoe.*

(a) Insulated Aluminum Conductor

This Court's conclusion that insulated aluminum conductor is a separate "area of effective competition" rests entirely on the price differential between aluminum and copper in two simple products. Appellees concede, and the District Court found, that a price difference exists; but, as the dissent points out, to characterize price as "the single, most important, practical factor in the business" (Slip Op. 5), is utterly incompatible with the District Court's unchallenged finding of fact that in the purchase of these products, the utility customer's decision "requires evaluation of numerous economic factors in addition to the cost of the wire or cable itself" (Fdg. 28, R. 1289; Dissent, Slip Op. 5).

But even if price actually were the "single, most important, practical factor" in the purchasing of wire

and cable, it would still be erroneous to define line of commerce without regard to the many other relevant economic factors enumerated by this Court in *Brown Shoe*. It is only by ignoring these factors, and the District Court's unchallenged findings relating thereto, that this Court is able to make the following assertion:

> As the record shows, utilizing a high cost metal, *fabricators of insulated copper conductor* are powerless to eliminate the price disadvantage under which they labor and thus can do little to make their product competitive, *unless they enter the aluminum field.* (Slip Op. 4) (Emphasis added)

This assertion, which is central to this Court's line of commerce conclusion, conflicts irreconcilably with the District Court's findings as to the nature of competition in the insulating business:

First. Contrary to the Court's question begging assumptions, there is neither a separate group of "fabricators of insulated copper conductor" nor a separate "aluminum field." This is shown, *inter alia*, by the District Court's undisputed findings that manufacturers regard themselves simply as "insulators of wire and cable products, not as insulators of copper wire and cable on the one hand, or of aluminum wire and cable on the other" (Fdg. 26, R. 1288); that insulated products are defined according to their function or type, "not according to the metal used as conductor" (Fdg. 25, R. 1288); and that the aluminum field "is not recognized in the industry as a separate economic entity" (Opin., R. 1316).

Second. The inability of producers to make their products competitive, except by entering a new field,

is unquestionably a meaningful factor in defining submarket boundaries. Indeed, this was recognized in *Brown Shoe* where this Court included among the practical indicia to be examined in determining such boundaries "unique production facilities," "distinct customers," and "specialized vendors." The significance of these indicia is that where one or more of them exists, manufacturers of product B cannot easily make and sell product A, and, therefore, the two products need not be combined in a single submarket.

Here, however, the District Court's uncontested findings make clear that not one of these practical factors operates to place "fabricators of insulated copper conductor" outside "the aluminum field." Thus, for example, the District Court found that there are not unique production facilities, specialized vendors, or distinct customers (Opin., R. 1316); that "the numerous manufacturers of insulated wire and cable constantly review their product lines and switch readily from one product or conductor metal to another in accordance with market conditions" (Fdg. 56, R. 1294-95), using "the same equipment and . . . the same personnel" on either copper or aluminum (Fdg. 27, R. 1288); and that manufacturers not presently making insulated aluminum products would do so if profitable orders were obtained (Fdg. 56, R. 1294-95). These and other findings (e.g., Fdgs. 55, 84, 85, R. 1294, 1299, 1300) leave no doubt that there is only a single insulating business, and that all insulating fabricators can readily commence the manufacture of aluminum line wire and multiplex cable without "entering" into a new or different "area of effective competition."

In sum, this Court's conclusion that there is a separate, self-contained insulated aluminum conductor sub-

market cannot be reconciled with the District Court's detailed and uncontroverted findings that insulating fabricators move freely between copper and aluminum, shifting easily from one product and conductor metal to another in accordance with market conditions.

(b) Aluminum Conductor

This Court has declared the combination of noncompetitive bare and insulated aluminum conductor products to be a line of commerce (Slip Op. 5). Since, as the Solicitor General conceded in oral argument, this conclusion depends on also finding insulated aluminum conductor to be a separate line of commerce, we believe it is erroneous for all of the reasons set forth above. But even if insulated aluminum were separable from insulated copper, it does not follow that the mathematical sum of bare and insulated aluminum conductor products would be a proper line of commerce.

The Court defends this grouping on the ground that it "is a logical extension of the District Court's findings" since aluminum and copper wire and cable, both bare and insulated, were grouped together in a broad composite line of commerce. That combination, however, corresponds to the well-recognized wire and cable industry, whereas the District Court expressly found that the aluminum conductor composite is not "generally recognized in the industry as a separate economic entity or submarket" (Add'l Fdg. 4, R. 1336-37). Thus, as the dissent points out, this Court's holding on this point is not "'a logical extension of the District Court's findings,' but a repudiation of those findings" (Dissent, Slip Op. 6).

Moreover, except for this Court's declaration that it "seems to us proper" to combine bare and insulated aluminum conductor products into one line of commerce, there is no basis in law, economics, or logic for holding this mathematical composite of noncompeting products to be a line of commerce. It does not meet the *Brown Shoe* submarket indicia; it is not a broad market since it does not embrace all reasonable interchangeable products (*Brown Shoe*, 370 U.S. at 325); nor, in view of the District Court's finding that it is not a recognized economic entity, can it properly be said that this amalgamation of non-competitive products forms a recognized industry, such as, the commercial banking and steel industries which were held to be lines of commerce in the *Philadelphia Bank* and *Bethlehem Steel* cases,[1] or, for that matter, the wire and cable industry. With all deference, we respectfully submit that it is nothing but a mathematical device originated by the Government for the purpose of giving this acquisition a deceptive and misleading appearance of numerical substantiality.

2. COMPETITIVE EFFECT

In *Brown Shoe*, this Court recognized that Congress did not enact a blanket prohibition of all mergers, but sought only to prevent "mergers having demonstrable anticompetitive effects" (370 U.S. at 319); while Congress was concerned with "probabilities, not certainties," nevertheless, "no statute was sought for dealing with ephemeral possibilities" (370 U.S. at 323). In *Philadelphia Bank*, the Court recognized the com-

[1] *United States* v. *Philadelphia National Bank*, 374 U.S. 321, 357 (1963); *United States* v. *Bethlehem Steel Corp.*, 168 F. Supp. 576, 593 (1958).

plexity and difficulty of the competitive effect question "in most cases," and established a carefully circumscribed simplified test of illegality (374 U.S. at 362-63).

In the present case, the Court has departed from the cautious, analytical approach charted in *Brown Shoe* and *Philadelphia Bank*, and has reversed the District Court on the basis of market share statistics which have absolutely no competitive significance. To the extent the Court has attempted to confer such significance by relying on the acquisition's economic setting, we respectfully submit that its opinion repudiates the District Court's findings of fact.

(a) This Court has based its conclusion of illegality on market percentages that have absolutely no competitive significance. Alcoa's 27.8 per cent in 1958 consisted predominantly (more than 90 per cent) of bare aluminum cable, while Rome's 1.3 per cent consisted predominantly (more than 80 per cent) of insulated aluminum conductor. Since bare and insulated products are used for different purposes and are not even claimed to be competitive with each other, the composite percentages do not manifest any "inherently anticompetitive tendency." *Philadelphia Bank*, 374 U.S. at 366. Rather, they obscure the fact that Alcoa and Rome had fundamentally different interests and strengths in the wire cable field, and, as the District Court found, were not substantially competitive with each other (Fdg. 52, R. 1294; Fdgs. 77 and 78, R. 1298-99).

(b) Nearly 80 per cent of the composite aluminum conductor line consists of bare aluminum cable. With respect to this product, Alcoa, in 1958, held a leading, though rapidly declining, position. Rome, however,

which was and is primarily a manufacturer of insulated copper products, was *de minimis*, with only .3 per cent of the market, and no appeal was taken from the District Court's ruling that the prohibited anti-competitive effect had not been shown with respect to bare aluminum cable. Nevertheless, this Court's reversal of the District Court rests almost entirely on Alcoa's bare aluminum cable shipments, which account for more than 90 per cent of its total aluminum conductor shipments.

(c) Even if Rome's 1.3 per cent is considered without regard to its composition, it is concededly small. Nevertheless, the Court pronounces that "in this setting [it] seems to us reasonably likely to produce a substantial lessening of competition . . ." (Slip Op. 8). We respectfully submit that this Court's conception of the "setting" of this acquisition conflicts at every material point with the District Court's concrete and thoroughly substantiated findings:

(i) An important factor in the "setting" of this merger is the substantial decline in Alcoa's market share, both before and after the Rome acquisition,[2]

[2] These declines are summarized in the following table (based on Fdg. 45, R. 1292-93):

	1954		1958		1961	
	Alcoa	Rome	Alcoa	Rome	Alcoa	Rome
ACSR and Aluminum Cable, Bare	48.4	0.2	32.5	0.3	26.1	. . .
Aluminum Wire and Cable, Insulated or Covered	10.0	6.9	11.6	4.7	7.3	5.7
Aluminum Conductor Wire and Cable	42.8	1.1	27.8	1.3	23.5	1.3

as a result of which the Alcoa-Rome 1961 market share was more than 40 per cent below that held by Alcoa alone in 1954 and about 15 per cent below its 1958 share. This decline demonstrates not only that Alcoa does not hold a dominant or controlling position in the aluminum conductor field (Opin., R. 1326-27), but that this acquisition did not produce the "significant increase in the concentration of firms in" the relevant market upon which this Court based the rebuttable presumption of illegality in *Philadelphia Bank*, 374 U.S. at 363.[3]

(ii) Though acknowledging that decentralization has occurred, the Court asserts that it "resulted from the establishment of a few new companies through federal intervention, not from normal, competitive decentralizing forces" (Slip Op. 7). It should be noted, first of all, that charges that Alcoa monopolized aluminum cable were not sustained (*United States* v. *Aluminum Company of America*, 148 F. 2d 416, 438 (2d Cir. 1945)), and that federal intervention related primarily to the establishment of competitive ingot capacity. Only with respect to Kaiser may it be said that competition in the aluminum conductor field could, in any part, be attributed to government action. Moreover, the unsupported assertion that government intervention is the only decentralizing

[3] As Professor Bok states:

> [W]hile a declining market share may not imply that domination has ceased or is about to cease, it does interfere with the finding of a trend toward *increased* domination to which the merger can be related. Hence, it is hard to condemn such a merger otherwise than as a penalty for size and power achieved by other means at some other time. Bok, *Section 7 of the Clayton Act and the Merging of Law and Economics*, 74 Harv. L. Rev. 226, 282, n. 206 (1960).

factor operating is flatly contradicted by the District Court's undisputed finding that most of the nearly 30 companies that have "entered" the so-called aluminum conductor market were previously established wire and cable fabricators (Opin. R. 1323; Fdgs. 54, 57, R. 1294-95).[4] There is every reason to expect that the vigorous competition and complete ease of entry found by the District Court will facilitate still further decentralization (see note 5, *infra*).

(iii) As part of the "setting" in which Alcoa's acquisition of Rome's 1.3 per cent is said to be unlawful, the Court observes: "It would seem that the situation in the aluminum industry may be oligopolistic" (Slip Op. 8). Whatever might be the validity of this tentative and equivocal appraisal of the aluminum industry, this case involves the so-called aluminum conductor market. As to it, the District Court found that "there is vigorous competition among all manufacturers of aluminum conductor . . . products" (Fdg. 62, R. 1295), that there is great ease of entry (Opin. R. 1323), and that this acquisition neither diminished the vigor of competition (Fdg. 69, R. 1297) nor changed the condition of entry (Fdg. 58, R. 1295).

(iv) As further justification for condemning this acquisition, nothwithstanding Rome's small market share, the Court observes that a tendency to oligopoly

[4] In 1955, prior to becoming a primary aluminum producer, Anaconda accounted for 10.7 per cent of total aluminum conductor shipments. In addition, Southern Electrical, which was an 8.1 per cent factor prior to being acquired by Olin-Mathieson in 1957, and numerous other companies, e.g., General Cable, Central Cable, Essex, Southwire, Nehring, also became vigorous competitors in aluminum conductor wholly without government intervention (Gx 434; R. 2713-14).

may "be thwarted by the presence of small but significant competitors" (Slip Op. 9). Abstractly, this is true; as it relates to Rome, it is contrary to the District Court's undisputed findings that Rome "was not an aggressive price competitor," that it "adhered to a policy of not going below the prices of its competitors" (Fdg. 53, R. 1294), and that Alcoa had lost only an "insignificant" amount of aluminum conductor business to Rome in the two years preceding the acquisition (Fdg. 52, R. 1294). On the other hand, there are "many strong, well-financed and highly reputable concerns" in the wire and cable business (Fdg. 81, R. 1299), which either make aluminum conductor products or can "readily" do so with their "existing machinery and personnel" (Fdg. 56, R. 1294-95). These firms afford a potent safeguard against any tendency to oligopoly, and a broad potential for even further decentralization in the so-called aluminum conductor line of commerce.[5] These features of the competitive setting of this acquisition have been wholly disregarded by this Court.

(d) In *Philadelphia Bank*, this Court established a limited rebuttable presumption of illegality applicable only to a merger which produces "a firm controlling an undue percentage share of the relevant market, and results in a significant increase in . . . concentration . . ." (374 U.S. at 363). It found that this presumption applied to the bank merger there involved, and, after due consideration of the record evidence, con-

[5] This process is already unfolding with General Electric and Circle having begun to expand their aluminum conductor sales, and Phelps Dodge planning to offer a line of aluminum conductor products (Appellees' Brief, pp. 68-69).

cluded that the presumption was not overcome (374 U.S. at 366-72).

Here the facts do not sustain a *Philadelphia Bank*-type presumption, since, among other things, the percentages combine noncompeting products and the merger did not produce a significant increase in concentration. But, apart from this basic deficiency, this Court has not even attempted to consider the District Court's unchallenged findings which, to a degree unparalleled in Section 7 cases, affirmatively establish the absence of probable anticompetitive effect. These findings, as more fully discussed in Appellees' Brief on the Merits (pp. 49-51, 78-83), establish, *inter alia*, that neither competitors nor purchasers have been or will be adversely affected by the acquistion; that there is extraordinary ease of entry; that the Alcoa and Rome market shares declined substantially before and after the acquisition; that Rome was not an aggressive price competitor; that there was not substantial competition between Alcoa and Rome in the sale of aluminum conductor products; that Alcoa's purpose was to secure insulating capability and diversification rather than expansion of its aluminum conductor facilities; that Alcoa has no history of prior acquisitions, or any plan for future expansion through mergers; and that there is vigorous competition which has not diminished as a result of the acquisition.

We respectfully submit that under the *Philadelphia Bank* decision, appellees are entitled to have these undisputed facts fairly considered before being subjected to "that most drastic . . . of antitrust remedies—divestiture." *United States v. E. I. duPont de Nemours & Co.*, 366 U.S. 316, 326 (1961).

3. RELIEF

With but one unique exception,[6] this Court has always held in antitrust cases that "[t]he determination of the scope of the decree to accomplish its purpose is peculiarly the responsibility of the trial court," *United States* v. *United States Gypsum Co.*, 340 U.S. 76, 89 (1950), and that "[t]he framing of decrees should take place in the District rather than in Appellate Courts." *International Salt Co.* v. *United States*, 332 U.S. 392, 400 (1947). Thus, while it is clear that there will be careful scrutiny in this Court of the relief granted by a trial court in antitrust cases, "the responsibility *initially* to fashion the remedy" is in the District Court. *United States* v. *E. I. duPont de Nemours & Co., supra*, 366 U.S. at 323 (Court's emphasis).

Although divestiture is the usual remedy in Section 7 cases, *United States* v. *E. I. duPont de Nemours & Co., supra*, 366 U.S. at 328-29, circumstances may exist in which equitable relief short of divestiture may be adequate and appropriate. See *United States* v. *Jerrold Electronics Corp.*, 187 F. Supp. 545 (E.D. Pa. 1960), aff'd 365 U.S. 567 (1961); cf. *Brown Shoe*, 370 U.S. at 337, n. 65. In any event, the District Court should have an opportunity to determine in the first instance whether divestiture may be required.

For all of the foregoing reasons, we respectfully urge rehearing should be granted because, under the Court's opinion, appellees will be faced with the expense and dislocations of an enforced divestiture, notwithstanding the fact that by the objective standards

---

[6] In *United States* v. *El Paso Natural Gas Co.*, 84 S. Ct. 1044 (1964) divestiture was ordered by this Court in unusual circumstances in no way comparable to those of this case.

established by this Court in prior cases, the District Court's dismissal of the Government's complaint was clearly correct.

Respectfully submitted,

HERBERT A. BERGSON

Attorneys for Appellees

CERTIFICATE

The foregoing petition for rehearing is believed to be meritorious and is presented in good faith and not for delay.

HERBERT A. BERGSON
